# Reader's Guide

---

The Reader's Guide assists readers in locating articles on related topics and classifies entries into 10 general topical categories:

1. Biography and Prosopography
2. Concepts and Terms
3. Content Descriptions
4. Influences on Curriculum Studies
5. Inquiry and Research
6. Nature of Curriculum Studies
7. Organizations, Schools, and Projects
8. Publications
9. Theoretical Perspectives
10. Types of Curricula

# About the Editor

---

**Craig Kridel** is the E. S. Gambrell Professor of Educational Studies and curator of the Museum of Education at the University of South Carolina. His research focuses on progressive education, biographical inquiry, and documentary editing, and he has recently published, with Robert V. Bullough Jr., *Stories of the Eight Year Study: Rethinking Schooling in America*. Other publications include *Books of the Century* (featured in *Education Week* and *Educational Leadership*), *The American Curriculum*, *Curriculum History*, *Writing Educational Biography*, *Teachers and Mentors*, and *Classic Edition Sources: Education*, and he served as associate editor of the *Macmillan Encyclopedia of Education*, advisory board member of the SAGE *Encyclopedia of Reform and Dissent*, and consulting editor of *The SAGE Handbook of Curriculum and Instruction*. His work has received the American Educational Research Association–Curriculum Studies Book

Award, American Association of Colleges of Teacher Education Outstanding Writing Award, the Educational Press Association of America Distinguished Achievement Award, and the Choice Magazine Book of the Year Award–Education.

He was the founding editor of the journal *Teaching Education*, served on the editorial board of the *History of Education Quarterly* and the *Journal of Curriculum Theorizing*, and has served as president of the Society for the Study of Curriculum History, member of the board of directors of The Maxine Greene Foundation, founder and chair of the American Educational Research Association Biographical Research Special Interest Group, and program chair of American Educational Research Association–Curriculum Studies. He is currently researching 1940s Black progressive high schools in the American southeast and is beginning an examination of cooperative studies from the 1930s and 1940s.

# Introduction

---

## The Field of Curriculum Studies

During the past decades, much effort has been devoted to defining *curriculum studies*, an ever-changing academic field that at times proves amorphous and bewildering. In fact, few areas of education have so conscientiously scheduled symposia to ascertain the field's health and to suggest future directions. More than 75 presentations during the past 15 years have been staged at American Educational Research Association (AERA) conferences to define and to determine whether if the field of curriculum is "moribund," as famously asserted by Joseph Schwab and Dwayne Huebner, or merely engaged in the ongoing quest for meaning and relevancy today. Moreover, few professional terms appear so omnipotent as well as baffling as *curriculum*. Defining the word has become a regularly practiced activity, yet consensus is illusive. While authors seek to construct conceptions with great precision, definitions remain idiosyncratic and sui generis. Often, *curriculum* is defined simply as a course of study. Other characterizations view the term more as a state of mind or act of inquiry that results in some form of growth. For this publication, an operational definition of *curriculum* consists of conceiving and configuring experiences that potentially lead to learning, and *curriculum studies*, thus, becomes the examination of this process. No doubt this explanation may well be as generic and flaccid as any that will ever appear in an educational encyclopedia. Yet, a careful reading of conceptions of curriculum through the years, notably Philip W. Jackson's analysis in the 1992 *Handbook of Research on Curriculum*, causes one to quickly realize that an open-ended, fluid definition is necessary to confront the complexity that characterizes and sometimes seems to threaten the field.

The study of curriculum, beginning in the early 20th century, served primarily the areas of

educational administration, pedagogy, and testing and was seen as a method to design and develop programs of study for schools. In what became a distinct academic field, curriculum subsequently expanded to draw on various disciplines from the arts, humanities, and social sciences in order to examine broader educational forces and their effects on the individual, society, and conceptions of knowledge. Many curriculum leaders at mid-20th century represented an avant-garde in educational studies where "middle-range theorizing"—exploratory theory integrated with thoughtful practice—took form in different ways, as conventional program development as well as more expansive forays into educational design. In the early 1980s, *curriculum studies* became a more commonly used term to separate itself from "the field of curriculum" and its emphasis on program design and development and "curriculum and objectives" traditions. The field of curriculum studies has now emerged to embrace a contested conception of academic scholarship and research. Although similarities to other educational fields—social and cultural foundations, educational policy and administration, cultural studies, instruction and supervision, assessment and evaluation—are pronounced, the differences are profound.

## How the Encyclopedia Was Created

The *Encyclopedia of Curriculum Studies*' conception and administrative structure were developed by William H. Schubert long before I became involved with the project. Because of the failing health (and impending death) of his wife, Dr. Ann Lopez Schubert, Bill was unable to serve as editor, and I was invited to accept this position. As I assumed this role, Bill proved to be an extremely helpful consulting editor; however, the orientation of the encyclopedia shifted as I began reconsidering

the role and intent of the project. Bill had originally expanded the parameters of the encyclopedia to include a strong representation of the “outside curricula,” a concept that he has introduced into the field. In contrast, with my prior experience in documentary editing and reference-archival work, I came to see the encyclopedia in a slightly different way. Rather than attempting to reconceive and redefine curriculum studies, I viewed the publication as a form of service to help the reader understand the field and those core terms and concepts that comprise its essential features.

I proceeded to develop a list of topics by reviewing the major synoptic textbooks and handbooks. My tabulations were supplemented by two previous research projects where I classified and analyzed the titles of more than 10,000 presentations from the American Educational Research Association (AERA) Division B: Curriculum Studies meetings and the Bergamo Conferences between 1973 and 2005. I was also afforded the opportunity to examine the galley proofs of *The SAGE Handbook of Curriculum and Instruction*, thanks to the professional kindness of its editor, Michael Connelly, so that I could consider including important terms and concepts from that work, and I elicited suggestions for topics from emeriti faculty as well as junior colleagues while receiving listings from each member of the editorial board. My intent was to compose an encyclopedia as a comprehensive supplement to the many introductory and advanced publications in the field. From all of this research, I prepared a listing of topics for a two-volume encyclopedia of 500 entries and approximately 600,000 words.

### Rationale for the Encyclopedia

The field of curriculum studies stands first among equals in its efforts to explore various conceptions of educational research and inquiry. Scholarship has become intricate in its effort to address persistent questions and issues. What becomes apparent quite quickly, however, is the need for a work that supports and assists the efforts of the neophyte who has entered this “booming, buzzing confusion” known as curriculum studies. This is where an encyclopedia establishes its unique role, differing substantially from textbooks and handbooks. Curriculum studies is resplendent with

these synoptic overviews. From the legendary texts of Hollis Caswell and Doak Campbell’s *Curriculum Development* and Harold Alberty and Elsie Alberty’s *Reorganizing the High-School Curriculum* to the well-known handbooks—*The Handbook of Research on Curriculum* and the recently published *The SAGE Handbook of Curriculum and Instruction*—numerous works have mapped the arenas of curriculum research and scholarship, design and development, and narrative and discourse. Although the content of these publications has varied with their differing perspectives and paradigms, the intent remains similar: to develop “comprehensive frameworks” to portray an overwhelming array of ideas for a field of study that continues to expand and change.

The *Encyclopedia of Curriculum Studies*, in contrast, does not seek to introduce new configurations of the field. In recognition of the lexiconic heritage of an “encyclopedia,” this two-volume set serves as an introduction and general education, supplementing and assisting those newcomers who want to understand the professional and specialized knowledge component of curriculum studies. This publication, extending Ernest Boyer’s types of research in *Scholarship Reconsidered*, represents a form of service scholarship, providing a place of respite to read succinct statements, to learn unfamiliar terms and concepts, to become more comfortable with specialized phrases, and to supplement one’s understandings of those many significant and perplexing concepts and questions that characterize the field.

### Content and Organization of the Encyclopedia

The *Encyclopedia of Curriculum Studies* has attempted to anticipate, carefully and cautiously, the needs and interests of newcomers to curriculum studies. A review of the reader’s guide on pages xiii–xix displays the listing of entries configured categorically and along the following 10 specific themes:

1. Biography and Prosopography
2. Concepts and Terms
3. Content Descriptions
4. Influences on Curriculum Studies

5. Inquiry and Research
6. Nature of the Curriculum Studies
7. Organizations, Schools, and Projects
8. Publications
9. Theoretical Perspectives
10. Types of Curricula

Topics (headwords) have been selected in recognition of their significance and frequency of usage in the literature. Although some curriculum scholars may object to certain entries that have been included, an encyclopedia accepts a vow to represent and portray fairly the entire field. “To list is to exclude,” and other veterans from the field will examine the reader’s guide with an eye toward not what appears but, instead, what is absent. A few headwords may be missing not because of the editors’ disregard but, alas, because these terms have indeed lost their usefulness and, thus, significance for current dialogue. Although three past presidents of the Society for the Study of Curriculum History sit on the encyclopedia’s editorial board, the publication has taken a more contemporary than historical appearance. Little-known, antiquated terms and concepts, once of considerable importance, do not appear in its pages because the encyclopedia seeks to reflect current and to anticipate future trends. I should note here, however, that the *Encyclopedia of Curriculum Studies* could not fully embrace one of the more pronounced contemporary developments in the field: the internationalization of curriculum studies. A decision was made, in accord with the guidelines and urging of SAGE Reference staff, to focus this publication primarily on work in North America. With the inclusion of overviews of curriculum research throughout the world, the encyclopedia represents a mere introduction (and homage) to the transnational work that is currently under way. *The International Encyclopedia of Curriculum*, edited by Arieh Lewy, was published in 1991, and a new international encyclopedia project is long overdue.

The *Encyclopedia of Curriculum Studies* includes many distinctive features and entries. The field of curriculum studies recognizes the limitations if not dangers of official knowledge and an authorial voice. Thus, in what may be considered unusual among the SAGE Reference family of encyclopedias,

this publication includes a series of five essays attending to “the nature of curriculum studies” and five essays describing the “future of curriculum studies.” Each account, although different in its portrayal, is also authentic and honest in its description of the nature and future of the field. In addition, a series of headwords describes curriculum studies in relation to (and distinct from) eight other fields of study as a way to help articulate what distinguishes and separates the field. Another unique component of the encyclopedia stems from its treatment of the *26th Yearbook of the National Society for the Study of Education*, a 1927 two-volume set that has rightfully taken on legendary dimensions for the field of curriculum studies. In an effort to display the timeless quality of this work and of its 18 guiding questions, two curriculum scholars were invited to address each of the queries. We encourage readers to turn to the encyclopedia’s appendix, “Fundamental Curriculum Questions,” and follow the treatment of these perennial issues from contemporary points of view.

Various literary styles are intentionally depicted in the encyclopedia, partly as a way to portray the breadth and vitality of the field. As editor, I reviewed submissions with attention to balance but also with generous acceptance of different writing styles. Distinctive approaches to topics offer the reader greater insights into the field of curriculum studies, and I enjoyed encouraging authors to reconceive the detached encyclopedic tone when appropriate. For that reason, submissions by certain contributors, though significant and informative, differ greatly from the typical “simple and direct” encyclopedia style influenced by Jacques Barzun, William Strunk and E. B. White.

For those readers who will explore this publication by reading numerous entries, repetition is inevitable. I allowed seminal concepts to be noted and described regularly throughout the encyclopedia because, it is assumed, one turns to this type of reference work to consult a few specific topics. Rarely would one read the *Encyclopedia of Curriculum Studies* to learn, for example, a definition of “malefic generosity” and then decide to continue reading the prior entry, Magnet Schools, or the subsequent headwords Man: A Course of Study, Marginalization, and Mastery Learning. For that reason, the Tyler Rationale has become

a regular apparition throughout the two volumes along with other names and terms. But for those who decide to roam and explore the pages of this publication, interesting commonalities will appear from the work of distinguished curriculum studies leaders, and readers will most likely come to create their own conceptual unity among the entries. And, in its own way, the *Encyclopedia of Curriculum Studies* offers the careful reader a surprisingly revealing depiction of the conventions, mores, and accepted research and writing practices of the field of curriculum studies. Further, I suspect a review of entries, when placed in juxtaposition with common headwords from the SAGE *Encyclopedia of Educational Leadership and Administration*, the SAGE *Encyclopedia of the Social and Cultural Foundations of Education*, and the SAGE *Encyclopedia of Educational Reform and Dissent*, will offer further insights into the nature of the various fields of education. In essence, a comparison of identical headwords from these and other encyclopedias will prove most important as researchers study the dissemination of knowledge and examine further “the curriculum” and the nature of educational and curriculum studies.

One administrative decision will prove somewhat disconcerting to certain readers. As one who has devoted his career to championing biographical research in education, I found myself receiving queries from scholars and contributors expressing disbelief that entries about certain contemporary authors were not included. I approached the encyclopedia, instead, as an opportunity to identify and portray “exemplary” concepts, terms, books, and phrases, developed by those who have defined the field. As the founder and coordinator for nearly two decades of the AERA Biographical Research Special Interest Group, I found myself implicitly criticizing the standard biographical encyclopedia entry that consists of occupations, dates, and career details. Further, I recognized that much reference-oriented, life-history details are accessed by curriculum students from Internet sources. Thus, I accepted the SAGE Reference staff’s restrictions on the number of biographical entries, a figure greatly reduced from those allocated for already published encyclopedias. I used this limitation, however, as an opportunity to encourage authors to craft entries that featured the realm of intellectual biography rather than the typical scholarly chronicle treatment

of listing career facts. Further, the *Encyclopedia of Curriculum Studies* introduces a novel form of prosopography (group biography) in the form of a series of institutional “curriculum collectives,” historical portrayals of universities whose faculty have influenced greatly the development of the field. In addition, a number of “bibliographic entries” have been included that feature specific writings by curriculum leaders who have defined the field. Rather than congratulating a large number of contemporary authors (and dismissing too many others) with individual entries, I have honored our field’s leaders by featuring their emblematic terms and concepts and by inviting them and others to place their own stamp onto the professional literature by describing their defining concepts.

### Acknowledgments

My appreciation and sincere thanks to participating contributors can never be fully expressed. I invited many recognized scholars to contribute entries of 500, 750, 1,000, or 2,500 words—former presidents and vice presidents of AERA, ASCD, American Educational Studies Association, Professors of Curriculum, Professors of Education, and other related curriculum organizations as well as chaired professors, directors, deans, and recipients of AERA Division B’s lifetime achievement award. Mentioning in my letter of invitation that their days of encyclopedia writing may have ended long ago, I appealed to their goodwill and professional responsibility to view this project as an opportunity for many disparate and diverse perspectives to come together for a common good in the preparation of entries for this first (North American-oriented) encyclopedia of curriculum studies. With an assortment of good-natured responses, distinguished professors throughout the field of curriculum studies agreed, altering this encyclopedia from a writing activity “for the neophyte by the novice scholar” to a collection of carefully composed descriptions by recognized and renowned scholars. You, the reader, are the beneficiary as you now have the opportunity to review succinct, comprehensive statements from curriculum studies’ senior leaders—Michael Apple, Jean Clandinin, Michael Connelly, O. L. Davis Jr., William Doll Jr., Geneva Gay, Maxine Greene,

Madeline Grumet, the late Joe Kincheloe, the late Paul Klohr, Marcella Kysilka, Gloria Ladson-Billings, Sonia Nieto, William Pinar, Thomas Popkewitz, Edmund Short, Christine Sleeter, Daniel Tanner, Max van Manen, and so many others.

I greatly appreciate the assistance and advice of William H. Schubert; his gentle touch permeates the encyclopedia. I wish to thank the distinguished board of editors who, while selected by Bill, have so graciously and willingly devoted hours of writing to this project: William Ayers, Tom Barone, Noreen Garman, Janet Miller, Thomas P. Thomas, and William Watkins. They have served admirably in their own way as have the SAGE research scholars who willingly and valiantly accepted substantial research and writing responsibilities: Lucy Bailey, Donna Breault, Kara Brown, Ming Fang He, Timothy Leonard, and Erik Malewski.

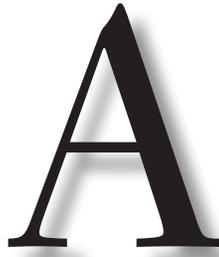

The administrative staff at SAGE Reference is most important to the success of any such undertaking, and I have found this so true with the *Encyclopedia of Curriculum Studies*. My initial conversations with Rolf Janke, acquisition editor,

convinced me that this was a project worth devoting considerable time. Carole Maurer, development editor, and Kate Schroeder, production editor, both assisted with thoughtfulness, kindness, and good cheer. Similarly, Robin Gold, Renee Willers, Laura Notton, Michele Thompson, and Leticia Gutierrez provided great assistance and conclude their *Encyclopedia of Curriculum Studies* duties with many entertaining anecdotes to amuse their colleagues. A most important staff member for such an enterprise is the managing editor, and this was certainly the case as Mary Bull provided the organizational acumen, detailed eye, and generous tone to guide this project to completion as well as, in her role as a skilled reference librarian, discovering and obtaining documents of great importance for many authors.

For all those involved with the SAGE *Encyclopedia of Curriculum Studies*, I greatly appreciate your participation and support of our effort to bring together the scholars from the field of curriculum studies.

*Craig Kridel*

---

## ACADEMIC FREEDOM

---

The modern concept of curriculum predates by about two centuries the principle of intellectual freedom to teach, or *lehrfreiheit*, derived from Humboldt's model (ca. 1810) for the new German universities, but this principle was not defined and defended within the U.S. university system until the early 20th century. Today, academic freedom seems more contentious than ever with conference titles such as *Free Inquiry at Risk: Universities in Dangerous Times*. The following questions are now common: Is academic freedom a constitutional and legal right? Who has academic freedom? Is the classroom a closed or open forum? To what degree is curriculum severed from instruction in academic freedom protections? These derive from one question: Who or what has authority over curriculum? Following a brief historical analysis of definitions, this entry focuses on the K–12 level and this overarching question.

Definitions of academic freedom reflect the American Association of University Professors' (AAUP) 1915 Declaration of Principles on Academic Freedom and Academic Tenure, which identified three key elements: freedom of inquiry and research, freedom of teaching within the institution, and freedom of extramural utterance and action. Following the AAUP's lead in the United States, the National Education Association (NEA) passed a "Freedom of the Teacher" resolution in 1928 to protect the public schools from corporate and private interests. The NEA expanded this in 1935 to

include the principle that administrators and teachers should have an opportunity to present various points of view on controversial issues to help students understand changing social conditions. Authority over the curriculum was particularly troubling through the 1920s and 1930s, and questions of academic freedom were part and parcel with reform of the schools. John Dewey reasoned in 1936 that academic freedom was a key aspect of political freedom and a necessary condition for democratic citizenry.

Thirty years later, U.S. Supreme Court Justice William Brennan underscored the importance of safeguarding academic freedom as a special concern of the First Amendment in the 1967 *Keyishian v. Board of Regents* decision. Yet at this time, only 55 of 2,225 public school district contracts protected academic freedom with provisions stating that educational and democratic values were best upheld in an atmosphere free from censorship and artificial restraints on free inquiry and learning. Current definitions reiterate this freedom of expression for teachers and students, but the courts have been imprecise in legal definitions of academic freedom. *Keyishian* aside, the Supreme Court's support of academic freedom is predominantly found in dissenting opinions, and it remains unclear whether academic freedom is a constitutional right. Signaling a clear message to K–12 teachers, the Supreme Court has refused to hear their academic freedom cases since January 1988. Twenty years after *Keyishian*, Justice Brennan wrote in the 1987 *Edwards v. Aguillard* decision that public education curricula are prescribed by

state boards of education and, thus, academic freedom as commonly conceived is not a relevant concept in the public school setting. Nevertheless, since 1988 the precedent case for K–12 teachers and students has been *Hazelwood School District v. Kuhlmeier*. In April 1983, Hazelwood East High School (St. Louis, Missouri) Principal Robert E. Reynolds censored the journalism class's student newspaper by pulling two articles on teen pregnancy and divorce. Three students (Cathy Kuhlmeier, Leslie Smart, and Leann Tippett) contacted the American Civil Liberties Union and filed suit. On January 13, 1988, the Supreme Court reversed the lower court's decision with a 5–3 majority opinion that established a precedent for K–12 teachers' cases: School officials were given permission to impose reasonable restrictions—related to legitimate pedagogical concerns—on the speech of students, teachers, and other members of the school. In dissent, Justice Brennan wrote that the case illustrates how schools camouflage viewpoint discrimination under a pretense of protecting students from controversial issues.

Although *Hazelwood* dealt with academic freedom for students, subsequent lower court cases involving academic freedom, such as *Boring v. Buncombe Board of Education* (1998) and *Board of Education v. Wilder* (1998), have tested this standard of legitimate pedagogical concerns against teachers' authority over curriculum. *Boring* makes it clear that authority over curriculum depends on how it is defined. Using *Webster's Third New International Dictionary*, the judges concluded that curriculum means all *planned* school activities (including extracurricular), and administrators are authorized to ensure that it bears the imprimatur of the school, providing confidence for parents. The voices (e.g., textbook authors) that enter the classroom are sanctioned to speak through the curriculum for the state or school board. In this way, classrooms are closed forums for teaching the adopted or planned curriculum, which administrators can actively safeguard on grounds of legitimate pedagogical concerns. The use of non-prescribed or *unplanned* materials requires a judgment by the teacher that something is sufficiently controversial to warrant a formal review for approval, and even when granted, as in *Boring's* case, approval may not translate into protection. *Boring* suggests that when in classrooms, teachers speak through the curriculum, meaning that

constitutional free speech protections stop at the classroom door. Hence, there are no distinctions between in-class curricular and in-class noncurricular teacher speech. For now, in the United States, if not in Canada, power in the conception of curriculum is legally invested in administrators and a few appointed or elected officials, and execution rests in teachers.

## ACADEMIC RATIONALISM

---

Academic rationalism is an orientation to the curriculum that honors the role of traditional content in the development of the rational human mind. Along with many adherents to other orientations, academic rationalists understand that, because of time constraints, not all available curriculum content can be taught in schools. To avoid an overstuffed curriculum, academic rationalists recommend a distinct criterion for answering the classic curriculum question regarding what knowledge is of most worth. For them, the most worthwhile learning centers on those enduring ideas and artifacts that have stood the test of time. The works that contain the greatest products of the human mind thus become the canon of the school curriculum.

Academic rationalists believe that human nature is unchanging and that there are eternal truths to

be discovered in a world outside of human beings. They therefore emphasize those perennial issues of human life as embodied within the traditional academic disciplines. For some academic rationalists, this includes all of the lasting productions of humanity. For others, these disciplines are those that have survived for centuries primarily within Western civilization, especially those originating in ancient Greece. Proponents of this latter form of academic rationalism that ignores important ideas and objects originating in non-Western cultures have been accused by critics of Eurocentrism.

Academic rationalists are closely associated with the liberal arts tradition within the academy. The ideas within, and products of, the liberal arts are viewed as the sources of human enlightenment. Following the lead of Plato in *The Republic* (Book VII), academic rationalists believe in the power of reason for guiding humankind closer to enhanced understanding and appreciation of the eternal standards of truth, goodness, and formal beauty. The mental activities of logic and contemplation are seen as means for moving humans away from the sources of confusion emanating from within the manual and practical activities of mundane experience and toward the formal realities that are the province of the human intellect. In that manner humans become liberated, able to transcend the ephemera of earthly affairs as they engage with other intellectuals in a Great Conversation about the common heritage of all humankind. Liberated from earthly emotions and passions through the elevated discourse of the curriculum, humans are freed to become less like animals (or for the ancient Greeks, slaves) and ever more human.

Dimensions of academic rationalism, usually under the label of the liberal arts tradition, can be found throughout the history of Western civilization. After ancient Greece, the orientation continued in the classical Roman period, and later, modified by Christian scholars in the Middle Ages, the curriculum philosophy could be found permeating church schools. Academic rationalism has prevailed in both Europe and the United States in much of the last three centuries. During this time, the historical reality continued: A liberal education was generally available only to wealthy young men, the classical canon of academic rationalism became the curriculum of the elite, leisure, and moneyed classes.

In the United States, however, during the 20th century, the influence of academic rationalism slowly declined as a result of the growth of the middle class and its desires for a more practical, vocational based curriculum. Later, the tenets of academic rationalism (sometimes referred to as the *traditional curriculum*) were challenged by progressive educators, such as the pragmatist philosopher John Dewey. But the liberal tradition and academic rationalism have rebounded at several points in U.S. educational history. Perhaps the most notable resurgence was the result of the work in the 1930s and 1940s of a group of University of Chicago professors that included Robert Maynard Hutchins and Mortimer Adler.

Today, vestiges of academic rationalism can be found in practice in U.S. schools, especially in the curriculum of various Catholic and other private secondary schools. Moreover, the liberal arts tradition has hardly disappeared from the (especially core) curriculum at U.S. universities, even if its influence has been eroded by professional orientations and a more modernized, and postmodernized, approach to university studies that is often viewed by students as more suited to their interests.

## ACCOUNTABILITY

---

*Accountability* is the state of being in schools today whereby all curricular decisions are made according to measures established by each state according to the No Child Left Behind Act (NCLB). Accountability has become the clarion call for pundits and politicians in response to the argument that the nation has “fallen behind”

others. Measures for accountability through NCLB are predicated upon closing the achievement gap found among disadvantaged and minority students.

### Measures of Accountability

Based upon the act, each state identified standards for every level in reading and math and, more recently, in science for Grades 3 through 8. Further, each state developed annual tests to measure the degree to which their students meet the standards. The data from the tests are made public in annual report cards for each school. According to the act, each state determines what students should learn in each grade, and each state determines the appropriate measures that indicate students are making adequate yearly progress (AYP).

According to the act, all students are included in the testing, and all students should be proficient in math and reading by 2013–2014. The act emphasizes that students in specific subgroups (racial/ethnic groups, the economically disadvantaged, those with limited English proficiency, and students with disability) are also expected to meet the state's designation of "proficient," unless the subgroup within a school is too small to ensure statistical validity.

Other measures are also included in a school or district's designation of AYP. High schools must use graduation rates as one indicator. Elementary and middle schools must also identify at least one measure beyond the test scores. Often, this measure involves attendance rates.

### State-Level Responses to Accountability

The act indicates that states should use test data to identify areas where additional support is needed. However, critics contend that schools that fail to make AYP do not get sufficient additional financial support. For example, the first year that a school fails to make AYP, the state provides resources to help the school determine how to reallocate the resources it has. Some of the resources that may have previously been used to support instruction may be reallocated to read data more carefully, to revise school improvement plans, and to extend learning time for students who need remediation. Often schools have to implement new reform models and may have to use significant resources for

professional development and monitoring the implementation of these models. If a school does not make AYP 2 years in a row, it must reallocate some of its resources to provide supplemental educational services to students from low-income families. If a school fails to make AYP for 3 years, it is required to choose at least one of the following options: replace staff, implement a new curriculum model, decrease its decision-making power, extend the school day or year, seek the services of an outside consultant, or reorganize the school. Any school that does not make AYP 4 years in a row is subject to restructuring where it may become a charter school, be run by a for-profit corporation, be taken over by the state, or remain a district school by replacing the principal and staff.

### Accountability and the Curriculum

Because so much of NCLB measures achievement in math and reading, many schools have narrowed their curricular focus to these areas at the expense of other subjects. Further, many schools have shifted the general nature of the classroom experience from active, relevant, and creative curriculum to drilling specific skills in the critical areas.

The national movement toward greater accountability through NCLB has also changed the manner in which curriculum materials are developed nationally. According to the act, curriculum must be developed according to scientifically based principles. Therefore, textbook publishers must use empirically based measures to create their curriculum. Further, they must use random and controlled experimental trials to demonstrate that their materials promote student achievement (according to each state's standards). Schools cannot adopt textbooks or reform models until the curricula have been deemed "scientifically based" according to the U.S. Department of Education's Institute for Educational Sciences (IES).

These measures of curricular accountability significantly affect textbook companies and makers of reform models. Because companies have to undertake extensive experimentation to achieve the status of "scientifically based," their programs are often costly and the companies are less likely to disclose the content of the programs to anyone other than those who purchase them. Ironically, while the government evaluates the companies,

they shield themselves from external critique in order to protect their intellectual property. Further, because companies have to ensure reliable means through which students can achieve according to state standards, they require schools and districts to implement their materials in prescribed ways. Deviations from the prescribed models and materials would compromise the integrity of the curricula. To this end, schools and districts often have to invest even more resources in training teachers to implement materials in prescribed ways, and they must maintain external reviewers to ensure the fidelity of implementation of the models. Finally, because much effort and many resources are devoted to the scientifically based curricula specifically designed to produce achievement on state tests, the overall nature of each school's curriculum is whatever is tested. As Elliot Eisner warned years ago, what gets measured is the only thing that matters.

## ACHIEVEMENT TESTS

---

Achievement tests are assessment tools that aim to measure what students know and what they are able to do in relation to academic learning objectives or learning standards. Achievement tests are relevant to curriculum studies because test scores are frequently used to determine the level of

instruction for students. These testing instruments attempt to provide evidence of what and how much a student has learned from past experiences or how much of a body of knowledge a student has mastered.

The most common type of achievement tests are standardized tests, which are given and scored in a consistent manner across testing sites. Standardized achievement tests typically measure knowledge and skills gained through classroom instruction at a certain grade level. To ensure all students taking the test receive the same amount of direction and time, administrative instructions are provided that may include scripted directions for the instructor to read to the group or individual as the test is being administered.

Achievement tests also are usually norm referenced, meaning they measure a student's performance compared with a normed group of peers who have previously taken the same test. This normed group is selected by test makers to be a sample group from the target grade level. This sample normed group is supposed to represent a typical group from the target level (e.g., all 6th graders across the state). When a school's or a student's test scores are reported in percentiles (i.e., Mark scored at the 89th percentile), it indicates the results are from a norm-referenced test. Percentiles range from 1 to 99 with 50 representing the average student. If Mark scored at the 89th percentile, it means he scored higher than 89% of the students in the normed group did. Scores can also be reported as a stanine or a grade level. A stanine is a standard point scale that indicates broad differences in performance. For example, if a student scores a stanine of 2 in Reading and 8 in Mathematics, it would indicate a significant difference in the student's learning in these two content areas. Most norm-referenced achievement tests consist of multiple-choice questions but may also include open-ended short answer questions.

Achievement tests are commonly contrasted with aptitude tests. An aptitude test intends to predict how well a student would be able to learn something when given the opportunity to do so. They look at general cognitive traits. For example, the SAT is used as a tool to predict students' success at the college level. Achievement tests do not predict a student's ability to learn but rather measure what students have already learned.

When a student scores high on an achievement test, it usually indicates he or she has mastered a great deal of the curriculum. Low scores might designate the need for remediation or the use of alternative methods of instruction or materials. The content of achievement tests is said to be valid when it has been taught to the test-taker. Achievement tests are meant to align with learning objectives and standards so that test results can be effectively analyzed to determine curriculum development and direction. This entry continues with examples of achievement tests and discusses the controversy around them.

State achievement tests currently used in many of the nation's schools attempt to measure the match between a state's learning standards, a school's curriculum delivery, and students' learning. Many states test students across grade levels and content areas to determine whether they are mastering the learning standards. Common commercial achievement tests include the California Achievement Test, Iowa Tests of Basic Skills, Stanford Achievement Test, and Woodcock Johnson III Achievement Test.

The increased use of achievement tests in schools during the past two decades as a result of federal policies such as Goals 2000 and No Child Left Behind has spurred controversy over their purpose and value. Achievement tests have taken on the role of assessing students', instructors', and schools' academic proficiency at a particular grade level. Schools and students are expected to increase and maintain high achievement scores and to turn out more proficient students than ever before. Schools' report cards are provided on the Internet, displaying the school's performance on achievement tests to the world. Performance pressure has led some to use the term *high stakes* to refer to the testing structures currently mandated in many districts.

For some, achievement tests represent a tool that inspires confidence and for others cynical distrust. Proponents say that achievement tests are the only objective measure there is of a school's effectiveness and of students' learning. Tests can confirm progress and learning and can identify needs. Advocates propose that students with special needs and schools in which test scores are consistently poor can be identified through testing programs. Funding and other resources can be fairly allocated to schools with high needs as indicated by overall test scores. Tests can indicate where support is needed.

Conversely, critics of achievement tests contend they can contain items that may be culturally biased or unfamiliar to some populations. Tests may include some questions that favor one culture or social class over another for reasons that have nothing to do with the content being tested. Certain test items may reflect knowledge or experiences gained outside of a school context that are more commonly acquired by middle- or upper-class students than by students in lower socioeconomic groups. Timed tests may penalize students whose first language is not English or who have learning disabilities. Or, achievement tests may contain test formats, such as short-answer responses or multiple-choice questions, that prove difficult for students with learning disabilities to decipher and respond to with proficiency. Critics also argue that testing may cause teachers to focus on tested content and ignore untested content or subjects that do not appear on the tests. Finally, testing may cause student anxiety, which may skew results.

## ACTION RESEARCH

---

Action research is a process through which teacher-researchers carefully and methodically examine their educational practice. Action research provides a systematic way for teachers to measure the success of curriculum, materials, and instructional methods. Teachers who conduct action research

intend to inform, compare, and possibly change classroom practices.

Action research offers a systematic and orderly plan for small-scale, real-world investigations designed toward intervention in a specific setting, often a classroom setting. Action research focuses less on large-scale relationships or on testing theory, and more on an individual problem encountered by the researcher. This method empowers practitioners to investigate a problem or issue, create a detailed account of the situation, and devise plans to deal with existing problems. In the realm of research on the curriculum, action research provides an authoritative method by which to measure the relative usefulness of varying curricular structures, reforms, and materials.

Action research is preplanned and organized, can be shared explicitly with other interested researchers, and can be replicated, although not usually for the purpose of generalization. The process of action research is not often linear but is often iterative. Because it is based in daily practice, action research is persuasive and accessible to those in the field of practice. It challenges the established system of educational research, based on university expectations, and allows participants to develop and to own both the problem and the solution rather than to be dictated to by university experts.

According to Ernest Stringer, there are four key components to the process of action research. First, *relationships* need to be developed: Action research rests on the equal status of all participants and relies on conflict management, acceptance of difference, and consensus building. Next, *communication* is central to action research. Participants commit to frequent attentive listening and to truthfulness during the gathering and analysis of data. Third, *continuous participation* is key to the success of action research. Participants must remain involved from start to finish, offer support for one another, and celebrate the accomplishments of the process. Finally, *inclusion* plays a vital role in successful action research: as many pertinent participants as possible need to be included to gain full benefit from the process.

### Reasons for Implementation of Action Research

For providers of services in community organizations and institutional settings, action research

offers a tool to solve problems, usually with a focus on the problems of a whole group, rather than of individuals. The process of action research adds to the practitioner's functional knowledge about the issues and information with which he or she deals every day, and its success can be measured by the practitioner's ability to make a difference in the organization. The study of issues in real school or classroom settings leads to better understanding of curriculum content and to improved teaching and learning. The mere recording and reporting of information by an outside observer is not adequate to complete these tasks: Members of academe and daily classroom teachers need to see one another as valuable and skilled collectors and analysts of relevant information.

### History of Action Research

The process of action research developed in the 1930s through a series of citizen group activities designed to improve schooling and other living conditions subsequent to the aftermath of World War I and the Great Depression. The history of action research has been reported disparately—sometimes conflictingly—but often includes the work of Kurt Lewin, Stephen Corey, Peter Reason and John Rowan, and Stephen Kemmis. The reputation of action research suffered extensive negative criticism during the 1960s because of its reported affiliation with radical political activism, but the process resurfaced in the 1970s in Great Britain, the United States, and Australia, where it has become established as an acceptable and authoritative alternative to traditional educational research.

Lewin has been credited with first coining the term *action research*, but Corey brought the process to bear as a means to improve school practice and empower teachers. Corey urged teachers to research their own curricula, methods, and materials scientifically to better to understand their workings and to make improvements. In the model that Corey presented, teachers became experts in curriculum development and reflective teaching.

Two designs persist for action research: practical action research and participatory action research. Practical action research offers improvement in individual cases to better practice, especially in classroom or school settings. Participatory action research is oriented for social and community organizations

and places an emphasis on research leading to equity, emancipation, and social change.

### The Process of Action Research

Action research follows an iterative and overlapping cycle of activities. The steps include asking a question or identifying a problem, making decisions about data (i.e., about ways to collect and frequency of collection), collecting and analyzing the data, deciding ways that the findings can be used, and reporting out. In some contexts, the report can also be embedded in a traditional theoretical context through a review of literature in the field.

Several experts in the process of action research define the steps as “look, think, act.” Participants look: They gather information and record raw data. Then they think: They analyze and interpret the information that has been gathered. Finally, participants act: They bring to bear the findings from the data gathering and analysis to resolve the problem that initiated the action research study. The detailed design of action research remains flexible, based on each situation. However, the general core of the process includes an initial assessment of the overall situation, the gathering of as much pertinent information as possible, the development of a network among interested parties at all levels, the inclusion of as many participants as can be recruited, and the creation of an understanding of the reality of the situation at hand.

The researcher in action research needs to assume an acceptable role, and that role differs dramatically compared with the role of the traditional university-based educational researcher. The researcher in action research assumes the role of facilitator, leads participants in a collaborative approach to the investigation, and buffers the process against outside “expert” judgments. As an insider, however, the researcher cannot serve as an enabler or facilitator in the same way that an outsider could, so he or she needs to build collaborative relationships with critical helpers or consultants from outside the research setting.

The practice of action research bridges the gap between ongoing university-based academic research and the daily work of teachers in the field. Action research empowers teachers and provides opportunities for professional development: Classroom

teachers can focus on a classroom challenge, a teaching method, or an area of content interest and conduct their own research to discover potential solutions to their difficulties. Action research can assist preservice teachers to recognize important elements of teaching in an authentic context and coach them to benefit from structured classroom observations.

Teaching professionals naturally solve problems every day in the course of their daily work. As school districts move away from centralized policy and decision making, instructional professionals in individual school buildings and classrooms face increased responsibility to solve their own problems. People who might previously have been regarded as mere “subjects” in a research study become directly involved as participants so the process of action research could benefit as many interested parties as possible. Data that might previously have been regarded as extraneous become important as the participants sift through many layers of information: The process of action research acknowledges that school settings are messy and constantly changing, so researchers examine as many types of information as possible to look for repeated patterns and themes and to make sense of information. Different types of data may be important at different times in action research projects: action researchers gather as much information in as many different forms as possible.

Action research relies on inductive analysis: The researcher and other participants observe and create order by organizing information into groups and categories. Generally, action research results in correlational or causal-comparative conclusions. Action research cannot be considered experimental because it involves no manipulation of variables, only the observation and acceptance of existing facts. Action research does include the statement of concrete conclusions based on reasoned deductions; recommendations or suggestions for change; and a plan of action, that is the purposeful intent to follow the conclusions of the research.

### Rigor in Action Research

Academic rigor is just as important in action research as in all other forms of research: The researcher needs to be clear about the methods for data collection, to challenge and test assumptions

about situation and data, to access as many different views of the situation as possible, and to ground diagnoses in existing theory. Action research is empirical but not in the sense that the process follows procedures prescribed by the scientific method.

Proponents of action research describe the method as legitimate, authentic, and rigorous. Even though the results of action research are pragmatic and immediately applicable in the field, and despite the engagement of “subjects” as research participants, the execution of action research demands that same careful planning and the same level of checks and balances required by more traditional research methods. Reflective practice is a key element to the success of action research: researchers cannot simply move quickly through data collection and analysis to some foregone conclusion: they need to think, sort, deconstruct, and compare before they conclude their studies.

looking at the daily activities of adults. With this method, every range of human experience must be subjected to analysis, including language activities, citizenship activities, occupational skills, health activities, and religious practices. Curriculum developers would study the adults who are the best at the various activities in order to select and perpetuate the most efficient skills. Once the daily activities of the most efficient adults have been analyzed and catalogued, these activities should become the basis for curriculum in the schools.

Activity analysis is one of the most powerful and enduring ideas in the field of curriculum. It became popular during the 1910s and 1920s, especially during the years immediately following World War I. John Franklin Bobbitt, a professor of educational administration at the University of Chicago, and W. W. Charters, a professor of education at the Carnegie Institute of Technology, were deeply influential in the spread of activity analysis.

In his 1923 book, *Curriculum Construction*, Charters uses the example of a cook to illustrate the central idea of activity analysis. To produce efficient cooks, curriculum workers should find the best cook possible, study his daily activities scientifically, catalog everything that he does, and then use these data as the basis for a curriculum that is designed to produce efficient cooks. This same process should be used for all human activities, both vocational and nonvocational.

Activity analysts such as Bobbitt and Charters sought numerous goals through the popularization of activity analysis. First, they wanted to make curriculum relevant during a time when the United States was undergoing rapid changes because of industrialization and immigration. Millions of children were immigrating to the United States during the early 1900s, and schools needed a way to develop curriculum that was relevant to these new students, many of whom came from eastern European countries such as Russia, Romania, and Poland. Second, Bobbitt and Charters presented activity analysis using the language of science and industry, which made the method popular among business leaders who wanted schools to operate like businesses as well as train workers. Third, activity analysis gave school administrators a way to create a curriculum that was not directly tied to the traditional subjects. Bobbitt and Charters were

---

## ACTIVITY ANALYSIS

---

The basic idea of activity analysis is that the best place to begin when creating curriculum is by

part of the early 20th-century progressive movement that sought to displace the traditional curriculum of subject-matter disciplines with something different, most often a curriculum based either on the individual desires of students or on the needs of industry. Educational reformers who followed Bobbitt and Charters could look to the adult activities in their local communities as the basis for their curriculum. At the same time, they could marginalize the traditional subjects—for example, Latin—that many of them found distant from the students who were enrolling in their schools.

Almost from the time it was introduced, activity analysis became the subject of criticism. The most common criticism has been that it relies too heavily on the current activities of adults and thereby leaves no room for social improvement. In other words, if all curricula were created using activity analysis, we would be training students to perform only the activities that adults currently perform, not the ones they will perform in the future. A method that at first glance appears to be forward looking turns out to be deeply conservative in its outlook, argue the critics. Activity analysis also has been criticized because of its heavy emphasis on vocational training. Traditional subjects such as history and philosophy are no longer studied for their own sake, but only for their functionality in the world of work. This overreliance on utility, argue traditionalists, eliminates many of the joys that come with learning for its own sake. Critics also argue that activity analysis neglects a central dimension of moral education, which can come only from learning such challenging subjects as mathematics, philosophy, and foreign languages for their own sake rather than for the use that students will make of them later in life.

## ADULT EDUCATION CURRICULUM

---

The concept of curriculum remains underdeveloped in the field of adult education, although many of the issues concerning knowledge, power, and identity addressed in curriculum studies also manifest within education for adults. The lack of explicit recognition of curriculum and the concomitant lack of engagement with curriculum theory and the literature of curriculum studies derives from a highly diversified field with few broad curriculum structures and an entrenched commitment to learner-centered planning. This is changing, however, as increasing numbers of adult education scholars are coming to embrace perspectives that focus on the politics of curriculum, including race, gender, class, and sexual orientation, as integral aspects of the formal, hidden, and lived curricula of adult education. Adult education scholars are also exploring cultural studies approaches to curriculum, and thus are taking up conversations concerning popular culture that have occurred for some time in curriculum studies.

### The Scope of Adult Education Curriculum

In general terms, adult education can be considered as a set of deliberately designed educational activities aimed at people over the age of compulsory schooling. This includes adult literacy and numeracy education, English as a second language, and some professional development and continuing education activities, though it has historically excluded formal settings such as colleges. There is a great deal of diversity of purpose, methods, audience, and curricular approach within those activities. One reason for this diversity is the lack of legislation framing adult education with any degree of consistency. Different organizations and jurisdictions take a different view of what education should be available to adults, where it should be provided, and how that provision should be funded. For example, adult literacy education, which one might expect to be relatively uniform, can be delivered by community organizations, community colleges, national nongovernmental bodies, or municipal organizations, and be taught by volunteers, part-time tutors, or K–12 accredited teachers. The diversity of adult education is a key feature of the field.

Adult education has a strong tradition of radical, social justice–oriented education. Adult educators claim the work of Jane Addams’s Hull House in the 1920s and 1930s, Myles Horton’s Highlander Folk School of the 1930s, Moses Coady and the Antigonish movement in Canada in the 1930s, a variety of workers’ education programs, and the work of Paulo Freire. Despite these radical examples, adult educators have often embraced a progressive, humanist view of curriculum in practice.

Since the late 20th century, there has been increasing use of the term *lifelong learning* to indicate education beyond schooling, a term that includes higher education and community colleges as well as more traditional nonformal sites of adult education. The lifelong learning agenda has created opportunity for adult educators by aligning their work with a broad set of policy priorities, but at the cost of accepting a marketized view of education. The idea of education as an instrument of human capital development is often an uncomfortable one for adult educators. These tensions and expectations profoundly affect the approaches to knowledge that manifest in adult education theory and practice.

### Curriculum Approaches in Adult Education

Adult education has a long history of “classical” technical curriculum development, to some extent reflecting the pragmatic bias of the field. Ralph Tyler’s *Basic Principles of Curriculum and Instruction* is currently used in many graduate adult education courses on program planning to illustrate early approaches to curriculum that were adopted and practiced within adult education. Tyler’s rationale was adopted by adult educators and has been the basis of most theories of program planning in adult education since the 1950s; many adult educators argue that the Tylerian model has become the “classical” approach to adult education program planning. Although Tyler’s approach is critiqued in current graduate courses and by adult education scholars in general as being too linear and for not capturing the politics of the planning process and the complexities of how planners actually operate (see Ronald Cervero and Arthur Wilson’s work on the politics of program planning), Tylerian perspectives to planning can still be found in current adult education practice.

For example, recent funding within the lifelong learning sector is often tied to specific instructional objectives and demonstrations of learner progress, and these are used as a basic element of program accountability.

Within adult education, the term *curriculum* is infrequently used; this both underlines the differences from schooling and emphasizes the potentially idealized progressive nature of adult education’s pedagogy. The preferred term used within adult education is *program planning*, often signaling a collaborative process between educator and learners. Malcolm Knowles, who in the 1960s popularized the learner-centered approach to curriculum called *andragogy*, recommended replacing the idea of “curriculum” with that of “program.” Knowles believed that the notion of “curriculum” did not work for adults because adults are motivated to learn because of key traits believed to be consistent for all adults and directly relevant to the process of program planning:

- Teachers have a responsibility to help adults in the normal movement from dependency toward increasing self-directedness.
- Adults have an ever-increasing reservoir of experience that is a rich resource for learning.
- People are ready to learn something when it will help them to cope with real-life tasks or problems.
- Learners see education as a means to develop increased competence.

These principles emphasize the role of educator as facilitator, and the need to involve adults in the co-construction of the program. From this point of view, the idea of “curriculum” is considered inappropriate to use for education involving adults. Adult educators such as Knowles argued instead that adult learning should be organized by *problem*, not *subject*, area.

Scholars such as Cervero and Wilson, however, believe that although Knowles brought a new focus on the involvement of the learners themselves in the curriculum development process, he did not fundamentally change the normative focus of the classical model—telling educators what they should do in idealized educational settings. Cervero and Wilson argue that classical models such as these do not consider how adult

educators actually operate, and fail to consider political, economic, and social contexts within which educators operate. Although the “naturalistic” program planning models that developed within adult education in the 1970s and 1980s attempted to account for the messy, nonlinear ways in which real adult educators worked, these, too, failed to engage fully with the politics of curriculum development.

Because of the contrast between the espoused commitment to learner-centeredness and the pragmatic need to respond to external requirements, adult educators often experience significant dilemmas in the area of curriculum. A key example is credentialing learning. The proponents of progressive adult education would argue that credentialing learning is artificial and unhelpful, misrepresenting learners’ motivations and accomplishments as well as reshaping programs. Others see credentials as extremely valuable to learners, representing real achievement for them as well as increasing their employability or opportunities to continue their education. Credentials have both benefits and costs, and decisions about whether to incorporate them into programs are philosophically and pragmatically difficult.

### The Politics of Curriculum in Adult Education

Some critical adult educators such as Colin Griffin have regretted that curriculum studies scholars examining the curriculum as political text have had little impact on mainstream adult education. Part of the reason for the rarity of explicit references to curriculum is the tendency for adult education researchers and practitioners to separate themselves from school educators and school-based education, and from the kinds of curriculum work prevalent in curriculum studies. Adult education theorists have relied on philosophy and psychology, but more political, sociological approaches have been largely absent. Critical adult educator Griffin argues that the views of curriculum studies scholars such as Michael Apple and Henry Giroux, who raise vital sociological issues about power, ideology, and curriculum, have had little impact within adult education, where the focus remains grounded in philosophical and psychological approaches to learning and pedagogy.

This has changed somewhat since the 1990s, as adult educators are increasingly drawing from the work of critical curriculum theorists within curriculum studies, and are addressing adult education curriculum in terms of power relations and examining race, class, sexuality, and gender issues. Adult educators have within the last decade or so also begun examining issues of the hidden curriculum in adult education settings and have expanded definitions of curriculum to include a focus on popular culture and everyday life as curricular spaces.

The tension between the more recent power-based theories of curriculum within adult education research and the classical Tylerian approaches found in practice is remarkably reminiscent of the paradoxes of other educational areas, including curriculum studies. The common questions of power, knowledge, and pragmatism reach across the boundaries of field to permeate education as a broad endeavor. Adult education has developed an eclectic approach to these questions that, although avoiding the language of curriculum studies, can offer valuable insights to educators in every sector.

## AESTHETIC EDUCATION RESEARCH

---

The relationship between aesthetic research and the area of curriculum consists of at least two

aspects. The first, dating to the second half of the 20th century, is research into school curriculum that incorporates aesthetics through the arts, as well as the aesthetic dimensions of the general curriculum. The second aspect, dating to the 1990s, draws on aesthetic-based research methodology to study curriculum. Both aspects focus on the operational, day-to-day curriculum, and students' experiences of curriculum, using mostly but not exclusively qualitative methods.

The term *aesthetics*, coined in 1735 by Alexander Baumgarten to denote a theoretical and practical discipline aimed at the perfection of sensory cognition, derives from the Greek *aisthanomai*, perception by means of the senses. Aesthetics has since evolved to refer to the philosophy of art and the philosophy of aesthetic experience.

What forms of aesthetic education exist in the school curriculum? This question is particularly interesting given the multiple rationales of teaching the arts, from cultivating self-expression to inculcating cultural values, and given the historical and contemporary pressures for academic subjects and marginalization of the arts. Research on aesthetics in curriculum focuses on arts instruction and students' encounters with the arts, as well as on the general academic curriculum that possess aspects susceptible to aesthetic appreciation.

Long-standing questions on the educational (broadly interpreted) aspects of the arts and aesthetics were raised by philosophers from Plato and Aristotle to Immanuel Kant and Friedrich Nietzsche. More recently, the work on aesthetics of philosophers John Dewey, Susanne Langer, Nelson Goodman, and Harry Broudy, among others, pointed to the interconnectedness of perception, thinking, and feeling. Questions concerning the type of cognition involved in the arts were intensified in the late 1950s and 1960s with increased attention to school disciplines, triggered by the Russian launch of *Sputnik* and the U.S. anxiety about being left behind in the technological cold war race. The arts were not exempt from the need to justify their inclusion in the curriculum in terms of their contribution to the total enterprise of education. In these discussions, Broudy acknowledged that each discipline has its own methods of investigation and that each domain develops an internal logic, modes of inquiry, and canons of evidence. His rationale for the arts as part of general

education was based on aesthetic literacy as integral to life, based on aesthetic experience, and cultivated through arts appreciation, with *scanning* as a mode of inquiry.

The power of aesthetics in learning, teaching, and living, presenting diverse aesthetic dimensions to curriculum is the focus of George Willis and William Schubert's *Reflections From the Heart of Educational Inquiry*, including essays by Ted Aoki, Elliot Eisner, Maxine Greene, Madeleine Grumet, William Pinar, Susan Stinson, and Elizabeth Vallance, among others. In this volume, as in Dewey's earlier work, and increasingly in other literatures, the body is recognized as key to knowledge. The arts, unlike the traditional academic areas, are an arena in which the body is central to the engagement in the discipline. This makes dance, drama, music, and visual art education a particularly rich place to explore what embodiment means for curriculum and instruction. Philosopher Richard Shusterman proposes a systematic theory of philosophy as an art of living, conceived as a discipline of theory and practice with implications to curriculum, called *somaesthetics*. Somaesthetics is concerned with educational aims and offers new perspectives and techniques with respect to learning.

### Field-Based Research to Aesthetics in the Curriculum

The Aesthetic Education Program (AEP) of the late 1960s and 1970s was a comprehensive model for a curriculum in aesthetic education for elementary schools, using music, visual art, drama, dance, and literature as its content base. It was carried out by the Central Midwestern Regional Educational Laboratory (CEMREL), and conducted by Stanley Madeja, Louis Smith, Harry Broudy, and others. Introduced to correct the lack of recognition of the importance of the arts and their potential in the normal education of the child, the term was coined with the commitment to the importance of art and the aesthetic as an integral rather than marginal constituent of early curriculum, to be shared by all children. AEP aimed to enhance children's aesthetic perceptions and provide teachers with rich arts curriculum to complement existing arts programs. It advocated that aesthetic education should be concerned with the introduction of aesthetic

values and the development of aesthetic ways of perceiving and knowing. Research functioned in several roles: (a) extensive review, analysis, and classification of existing and relevant research in aesthetic education; (b) existing research in creativity, in child development, and in learning theory, was used to resolve curriculum issues and to help develop curricular activities; (c) research by evaluators who developed instruments to measure student achievement as a result of work with curriculum materials; and (d) research on the AEP program, its effects on teachers and students, and problems of implementation.

In the late 1980s, case studies of arts education and aesthetics in the curriculum were conducted by Robert Stake, Liora Bresler, and Linda Mabry, with additional observations in 50 other sites, supported by the National Endowment for the Arts and part of the National Art Education Research Center at the University of Illinois. This study noted the differences between the arts taught casually and occasionally by classroom teachers and the weekly arts production activities led by specialist teachers. It found extramural arts in reasonable health, dominated by instrumental music curriculum. Within the regular curriculum, the range of opportunities for artistic explorations and activities was remarkably broad: Some children had been denied arts for months as teachers responded to pressures to raise test scores. Others in the same district created a Navajo-inspired sandpainting under the watchful gaze of Vincent Van Gogh's self-portraits. In general, the message from the community to schools was summarized as "Keep art and music a part of the curriculum; keep it modest and conventional; continue the traditional performances and exhibits."

The Reggio Emilia preschools in Northern Italy, known for their creative, sophisticated aesthetic curriculum, first opened in 1963 (a development of preschool run by parents after World War II). Discovered by international scholars in the early 1990s, they have generated broad interest among early childhood educators. Described as an adventure and research undertaken by teachers and children, the operational curriculum is based on teachers' careful observation and documentation of what children say and do, highlighting children's artwork (which constituted the "Hundred Languages" exhibit that traveled across the globe). Referred to as an integrated art approach to

curriculum, it has been a learning-site, adopted widely in many countries, and the focus of research.

The centrality of the microcontexts (teachers' commitments and ownership) combined with shared visions and institutional support, is a consistent finding of successful programs. Boo Yeun Lim explored various approaches to aesthetic education in early childhood settings in the United States that were used in Waldorf schools, the Bank Street School for Children, and Reggio Emilia-inspired programs. Each of these programs had a different philosophy, but all were characterized by a child-centered curriculum. Lim found that the teachers teaching the arts, specialists and classroom teachers, shared some common images of aesthetic education, viewing it as a means to help children to see the world with sensitivity and become aware of aesthetic elements in artworks. Teachers' views were also shaped by the respective philosophies of the individual programs (social beings in the Bank Street school, higher order thinking skills in the Reggio-inspired school, and a focus on spirituality in the Waldorf).

Focusing on the cognitive aspects of visual art education, the Getty Education Institute for the Arts introduced in the early 1980s the discipline-based-arts-education (DBAE) approach, integrating visual art history, appreciation and aesthetics, and studio studies into elementary, middle, and high schools. Brent Wilson conducted a 7-year study of six programs for the Getty Institute. Data sources included observations in more than 100 schools in which DBAE programs were implemented. The study focused on the curricular level. Change initiatives concerning efforts for reform around art and aesthetics succeeded when the following occurred: (a) Change was systemic, especially when school leaders steered the initiative and increased ownership; (b) professional development and curriculum planning were pursued; (c) there was ongoing communication and collaboration within and among change communities; (d) there was collaboration between teachers and experts in specific subject areas; (e) museums and other community institutions provided settings for immersion and contents; and (f) skills, even those of the highest order relating to critical thinking and creative invention, were not ends in themselves, but were means for understanding human purpose and creating new visions of it.

Another Getty Institute research project, initiated in collaboration with the College Board, and conducted by Bresler focused on the integration of music, visual art, dance, and drama into academic subjects in five high schools. The schools, located in South Texas, New Mexico, Washington, Maryland, and Boston, Massachusetts, were chosen for their strong support for the arts integration by principals and teachers and for their diverse student population. Curricular contents, assignments, and evaluation measures encouraged students' higher level thinking and creativity. The integrated curricula emphasized personal and social relevance, connecting the past to present and faraway cultures to that of contemporary United States. Teachers' evaluation strategies drew on portfolios and projects (instead of essays and tests), encouraging the presentation of concepts and ideas in a variety of modes of representation and learning styles. The arts/aesthetic curricula changed the roles for both teachers and students. For teachers, curriculum design became an act of creation rather than just implementation. Teachers moved away from reliance on textbooks toward the active identification of overarching themes and broad issues. For students, their emergent ownership of the integrated work was connected with issues of identity, voice, and pride in their ideas and creation. Students' communication of their work to an interested audience of teachers and peers provided an additional aesthetic element and incentive to excel.

### Ethno-Aesthetics

In the postmodern paradigm of the late 20th century, aesthetic concepts were commonly acknowledged to be context-dependent and relationally embedded. The notion of aesthetic universality, along with other universals, has been deconstructed as contextual and social. Accordingly, research turned to examine the nature of the aesthetic in specific personal and cultural contexts. Although *aesthetics* refers to the philosophy of art, ethno-aesthetics refers to the emic study of any non-Western art forms. In addition to studying the aesthetic values of art forms in non-Western cultures, ethno-aesthetics focuses on art as perceived by people who produced it and use it, corresponding to anthropology of art and ethno-science of art. By using ethno-aesthetic approaches, the unique

aesthetic traditions and art forms within their social and cultural contexts can be understood.

Drawing on Jerome Bruner's notion of folk pedagogy, Yu-Ting Chen and Daniel J. Walsh explored how Chinese aesthetic education is perceived and valued at two elementary schools in Taiwan. Using qualitative methods, the research explores how arts teachers guide children to experience arts through the arts curricula in school and the local culture. Findings highlighted a respect for nature and a concern for local culture as well as cultivating children's character, and integrating the arts into everyday life. The teachers' shared views provide a broad picture of these folk beliefs in Taiwan as well as a cultural lens for examining aesthetic education in Taiwan and the larger Asian culture.

### Aesthetic-Based Research of Curriculum

Aesthetic-based inquiry is based on the contributions that the processes and the products of aesthetics make to research. It is grounded within a complex relationship between the constructs of aesthetics and research. These relationships go back two and a half millennia. The dichotomous view of reason/truth versus perception, a legacy of Plato, was maintained and developed by most Western philosophers. According to this dichotomy, aesthetic-based research is an oxymoron. The work of Dewey, arguing that art and science share the same features with respect to the process of inquiry, and the subsequent erosion of these traditional dichotomies in the late 20th century proved a fertile ground for aesthetic-based research.

Eisner's work has been critical in highlighting attention to the central role of the senses in research. In his conceptualization of research as connoisseurship and educational criticism, and his notion of connoisseurship and the *enlightened eye*, Eisner expanded the modes and expressions of research from the verbal and numerical to the senses. Many of his students drew on these ideas to study various curricular settings, notably Tom Barone's study of a visual art curriculum in Appalachia and Bruce Uhrmacher's study of the Waldorf schools.

The field of aesthetic-based inquiry has grown tremendously in the past 15 years and with it came a proliferation of genres, reflecting different purposes and commitments. Of particular relevance to curriculum is *a/r/tography*, the work of Rita Irwin

and her colleagues, highlighting seamless connections among art-making, research, and teaching. Bresler places the perceivers at the center, keeping a (soft) distinction between works of art and qualitative research of curriculum. The multiple forms that these inquiries can take are integral to the nature of the aesthetic as the capacity to perceive.

Aesthetic-based research, grounded in perceptual awareness, highlights the significant role of the body as reciprocal medium for negotiating understandings. Anthropologist Tom Csordas examines *somatic modes of attention*, which he regards as culturally elaborated ways of attending to and with one's body in surroundings that include the embodied presence of others. The literature on the body as a key research medium and the investigation of ways of knowing through the senses are relatively new areas of scholarship advocated by Marjorie O'Loughlin, Margaret Macintyre Latta, Susan Rasmussen, Paul Stoller, and Liora Bresler, among others. Extended to research, aesthetic-based inquiry attends to how the body forms and informs the processes of data collecting, (i.e., interviewing, observing,) interpreting, and analyzing.

Engagement of audience is a key issue. Positioning audiences to respond in ways that are integral to the reciprocal participation required of aesthetic experience has led to artist/researcher performance inquiries in the works of Norman Denzin, Donald Blumenfeld-Jones, Robert Donmoyer, and Celeste Snowber, among others.

### Further Issues

Aesthetic research in the two aspects presented in this entry—research on aesthetic curriculum, and aesthetic-based inquiry of curriculum—requires the researcher's aesthetic sensibilities. This has implications for researcher education. What competencies and sensibilities are useful in the training of researchers in general education? What are some aesthetic aspects that shape lived experience that need attending to? These diverse ways of conceptualizing aesthetic-based research promote innovative ways to understand aesthetics as disciplined, critical inquiry, highlighting imagination and intellect in constructing knowledge that is not only innovative, but is also compassionate and enables the transformation of human understanding.

## AESTHETIC THEORY

---

Aesthetic theory in curriculum studies brings a world that is interesting, surprising, frightening,

or beautiful together with students who meet that world through sensation, thought, and emotion. The world does not come to us hermetically contained in rational categories. Our thoughts and understandings of the world are thoroughly intertwined with the sensory experiences of our bodies, feelings, and emotions, as well as our habits of perception and applications of logic and analysis. Creative thought that generates new knowledge, as well as art, is drawn to the very edges of these categories that sort and organize our lives. Because philosophies of education, stretching from classical idealism through medieval scholasticism and the Enlightenment, celebrated the rationality of disembodied intellect, aesthetic theory in curriculum addresses the false distinctions of mind/body, thought, and feeling inherited from these eras.

Aesthetics played an important role in the thinking of progressive educators in the early 20th century. In *Art as Experience*, John Dewey portrayed the experience of aesthetic pleasure as the resolution of a situation that presents tension or resistance, recognizing harmony and beauty as expressions of that pleasure. Dewey and his colleagues at Teachers' College, William Heard Kilpatrick and Harold Rugg, recognized the importance of exploration, imagination, and participation in play and art to meaningful learning. By mid-century, though, these curriculum approaches were sequestered in early childhood education or in specialized schools such as the Waldorf Schools of Rudolf Steiner.

Contemporary curriculum theorists have elaborated on Dewey's location of aesthetic experience in the everyday lives of students and teachers. Elliot Eisner has studied the synthesis of feeling and thought in both art instruction and the evaluation of curriculum, welcoming the solutions and surprises that emerge in the processes of art-making. Recognizing teaching as artful, Eisner brought the categories and sensibilities of art criticism to the art of teaching. Following postmodern suspicions of convention and totalizing generalizations, aesthetic theory has generated new ways of studying educational experience, extended into research and scholarship in education. Scholars have turned to narrative, celebrating fiction's capacity to express desire and to theater where movement, improvisation, and the use of space and sound express ideas often muted in the rhetoric and method of social science inquiry.

Howard Gardner's theory of multiple intelligences added visual, bodily kinesthetic, musical,

interpersonal, and intrapersonal orientations to the linguistic and logical/mathematical skills that dominate school curricula. This theory of cognition is consistent with Dewey's understanding that to learn something is to fully participate in life, engaging all of one's faculties. Maxine Greene's work brings an existentialist edge to Dewey's emphasis on tension and resolution in aesthetic experience in her focus on freedom and on the intentionality and vitality that art works bring to the expression of alternative visions and imagination. Kieran Egan's focus on imagination leads him to challenge the hierarchies that dominate theories of child development. He points to the richness and complexity of children's imaginations and argues for arts curricula that will sustain and augment their capacities for play and fantasy instead of abandoning them to pursue only discursive and logical modes of thinking and expression. Challenging the obliteration of the body in curriculum and theories of instruction, feminist curriculum scholars have also turned to aesthetics to integrate sensuous experience into curriculum. In Wendy Atwell Vasey's study of language arts, Paula Salvio's study of Anne Sexton's pedagogy, and Stephanie Springgay's study of body knowledge in the curriculum, the arts are identified as sustaining intimacy, bringing a rich and complex expression of experience to curriculum. Arts integration projects take up this approach as the arts are intertwined with instruction in the academic disciplines. Integration becomes a theme even in arts instruction focused exclusively on the arts as educators debate the proper relationship between the making of art and the study of its history and critique.

Aesthetic theories have also been applied to the study of ideology and education. The work of Herbert Marcuse, Walter Benjamin, and Theodore Adorno, associated with the Frankfurt School of critical theory, explored the ways that culture encodes and embeds hierarchies of privilege and poverty. Recognizing that these relationships saturate religious, social, aesthetic, and educational processes, curricularists use aesthetics to name the ways that space, time, light, movement, sound, and texture express and reinforce hegemonic values. The powerful work of Paulo Freire in *Pedagogy of the Oppressed* incorporates aesthetic theory in its use of semiotics, reading the experience of poverty and domination from visual representations of

lived experience. Dwayne Huebner's analysis of the languages that represent schooling pointed to the absence of aesthetics in the culture of curriculum, and Landon Beyer's study of aesthetics and schooling addressed the distinction between fine and popular arts, the marginalization of art experiences in the curriculum, and the arts' capacity to serve as a media for social criticism.

Psychoanalytic theory, which addressed the ways that consciousness is structured to suppress nonconventional thought and feeling, suggests that art and creativity thrive at the edge of the ego, incorporating the exiled material of dreams and primary process into artistic work. The integration of arts in the curriculum broadens and deepens students' interpretations of it, allowing creative thought to challenge the status quo. The feminist movement has also challenged the male dominance of normative categories of the arts and art making, and national aesthetics are frequently critiqued for the exclusion of underrepresented groups.

Most generative, perhaps, is aesthetic theory's attention to form and transformation, supporting integration of the arts with the academic disciplines and inviting multiple symbol systems into the discourse systems of the classroom.

## AFRICAN CURRICULUM STUDIES, CONTINENTAL OVERVIEW

---

Africa is the second largest continent in the world and comprises 53 individual countries. Although

one might broadly identify historical periods (precolonial, colonial, and postcolonial) in Africa's history, developments during these periods differ when it comes to individual countries. This may explain why studies with a curriculum focus in Africa tend to be country specific, focusing on developments at a particular moment in time, and often emphasizing a single dimension of the curriculum problem. It is not possible in an overview of African curriculum studies to refer to developments in each of the 53 countries, so this entry provides a general picture of the kinds of studies that focus on curriculum design and planning, acknowledging that there are limitations in referring to Africa in any unified sense. By way of background, this entry briefly speaks about curriculum activities in precolonial and colonial Africa, but the main focus of this overview is on curriculum studies in the period after political independence was achieved in most countries—the period following World War II, when control of colonies by European countries weakened.

Although there was no systematic study of curricula, attempts at curriculum development date back several centuries. Efforts at developing curricula at a local level can be traced back to the 14th century, when Islamic education reached Africa from the Middle East. Two main curriculum areas, Arabic and Islamic traditions, were taught to children at elementary Arabic schools called Quranic schools. At age 3, children learned short chapters of the Quran by rote. At later stages, children committed the meaning of verses to memory by repetition. Colonial education began at a later date with missionary education, when the first missions were opened in some countries at the beginning of the 16th century. Curriculum activity of this period involved the construction of syllabi for schools, which were mainly vocational and religious. Many have argued that missionary education destroyed African indigenous education. School curricula were replicas of those that existed in European countries and were therefore foreign and irrelevant to Africa's development. Curriculum changes only occurred when the colonial governments expanded their exploitation of a country's natural resources. After independence, curriculum studies focused on reforms linked to the development of national

education policies—these studies largely focused on explaining the successes and failures of postcolonial curriculum policy initiatives.

The field of curriculum studies in Africa is largely underdeveloped. There is a paucity of curriculum scholars, and as a consequence, there is very little research, theory, and writing on curriculum planning and design. In some countries, curriculum scholarship is conducted mainly by visiting professors, international consultants, and postgraduate students from Europe and the United States. There are no journals dedicated to African curriculum studies, few books have been written on the topic, and few (if any) conferences have been held on the continent specifically devoted to the study of curriculum development. Very few African scholars publish in international journals of curriculum studies such as *Journal of Curriculum Studies* and *Curriculum Inquiry*. Most articles published on Africa in these journals during the last decade are by South African scholars. However, a more representative picture of African curriculum studies might be gained from reading international journals with a more general focus on education. Specific journals that would be particularly useful are *Comparative Education*, *International Journal of Educational Development*, and *International Review of Education*. Insights could also be gained from reading national education journals, but these are not always easily accessible to international audiences. The *International Handbook of Curriculum Research* has two chapters devoted to curriculum studies in Africa: one focuses on the decolonization of the curriculum in Botswana and the other on what scholars write about curricula in Namibia and Zimbabwe. Insights into the study of curricula in Africa could also be gleaned from reading research reported in journals in established fields such as mathematics education and science education.

In the main, studies that focus on the curriculum are of the following kinds: historical studies of curriculum change, literature reviews of curriculum reconstruction, case studies of curriculum innovation, and comparative studies. Comparative studies have been conducted between countries such as South Africa and Gambia, Namibia and Zimbabwe, and Rwanda and South Africa, but comparative studies between, for example, Anglophone and Francophone West African countries have also been reported.

## Major Trends in African Curriculum Studies

This section focuses on some of the major trends that have characterized curriculum studies in Africa. These include studies that critique colonial curricula and argue for the inclusion of indigenous knowledge; studies of curriculum innovations; studies of diversification of the curriculum; studies of language policy; and studies of assessment and examination systems.

### *Colonial Versus Indigenous Curricula*

A key debate that has characterized curriculum studies in Africa is colonial versus indigenous curricula, or exogenous versus endogenous models of a curriculum. After independence, there was much critique of colonial curricula in many African countries, and arguments have been made for greater relevance of curricula to African conditions and the cultural heritage of Africans. The extent to which these aspirations need to be balanced with the demands of technological process and economic development has also been a focus of curriculum studies in Africa. Tensions exist between Western conceptions and traditional African conceptions of education in West, East, Central, and Southern Africa, as well as between Western and Islamic conceptions of education in North African countries such as Egypt.

In the field of science education, there has been sustained discussion on the sociocultural frameworks of African learners and their experience of cognitive dissonance when they encounter school science—the latter framed in Western cultural and philosophical terms. Studies suggest that the culture of a learner's immediate environment plays a significant role in learning and that it determines how concepts are learned and stored in the long-term memory as schemata. Therefore, any science curriculum that does not take particular account of the indigenous worldview of the learner risks destroying the framework through which the learner is likely to interpret concepts. Through a process of collateral learning, an indigenous learner can perform excellently in a Western science classroom without assimilating the associated values. Studies suggest that in science classrooms, the teacher needs to take on the role of cultural broker, that is, he or she should help learners mediate or negotiate cultural borders. When cultural border

crossing (from life-world culture to school science culture) is difficult for the learner, the teacher needs to take on the role of a *tour guide*. In other instances where learners require less guidance when border crossing, the teacher may take on the role of *travel agent*, whereby the teacher provides learners with incentives such as topics, issues, activities, or events that create the need to know the culture of science.

Other studies propose the decolonization of curricula in African countries through integrating insights from critical pedagogy and African traditional values such as *ubuntu* (humanness). The humanness referred to here finds expression in a communal context rather than in the individualism prevalent in many Western societies. The argument is that in settings where human beings have been oppressed (their minds colonized through Western curricula) and deprived of their human rights, critical pedagogy and notions such as *ubuntu* invigorate vectors of escape.

### *Curriculum Innovations*

Curriculum innovations have been a central focus of curriculum scholars in Africa. In countries such as Zimbabwe and Namibia, every major curriculum innovation became the subject of intense study to understand the possibilities and constraints of curriculum change after independence. Comparative studies have also been done in, for example, West Africa between Anglophone and Francophone countries. Innovations included the following areas: the management of curriculum development, enrichment of learners' experiences, diversification of content, tools for teaching, and teacher education. In most cases, innovations did not attain their desired goals and studies raise critical questions about whether innovations were introduced to please foreign donors or whether they were introduced to bring about substantive changes in education. As noted, diversification of content and subjects forms part of curriculum innovations; however, given its prominence in African curriculum studies, it is discussed separately.

### *Diversification of the Curriculum*

Diversification of the curriculum refers to a shift from a focus on mainly academic subjects to

include practical and vocationally oriented subjects. Diversification of curricula has occurred in most African countries and, as in the case of "developed" countries, it is often the outcome of periods of crisis. Studies report that diversification of curricula has been initiated by governments, but in certain cases such as Sierra Leone, it was thrust on the country by the World Bank. Diversification of curricula has been a focus of study in Africa because it ostensibly offers a solution to economic and social problems faced by African countries and, in particular, the high unemployment rate among youth as well as the escalating costs of formal education. Studies on the diversification of curriculum focus on the following: attempts by African countries to vocationalize education; the evaluation of the impact of such programs; and making recommendations for future projects. Studies that have been conducted so far show that diversification of programs has not met its intended objectives, but that there remains an interest in curriculum vocationalization in Africa.

### *Language Policy*

The language policy adopted by countries is another important theme that is emphasized in African curriculum studies. The key issue here is the choice of language of instruction. Most African countries are multilingual countries. For, example, South Africa has 11 official languages and many more spoken variations. Some studies focus on the role of African languages in multilingual contexts, and other studies focus on the effects on African languages when English is chosen as the medium of instruction (Namibia is a case in point). Other studies raise concerns about children's learning when they are taught in the vernacular to Grades 3 or 4 and then have to switch to English as the medium of instruction in the next grade. Teachers instructing subjects such as science and mathematics through the medium of English are often not proficient in the codes and languages of their mother tongue at the most crucial moments when concepts are explained.

### *Assessment and Examination Systems*

Assessment and examination systems have received much attention in studies of curricula in

Africa. A major concern reported in studies is the continued use of foreign examination systems such as the Cambridge Examination System in countries such as Namibia and Zimbabwe and that such systems continue to place constraints on curriculum change in these countries. Even in cases where there have been changes in the name of the examination system, old practices remain entrenched. There has, however, been a shift in several countries where continuous assessment (CA) has been introduced. But studies show that several factors hamper the implementation of CA, such as lack of teacher experience and expertise; substantial increase in teacher workload; when CA includes project work, then learners from wealthy backgrounds benefit; there are several sources of unreliability within school-based assessment; and so on.

### Recent Trends

This section briefly describes some recent trends in African curriculum studies. A trend that emerged in the 1990s is using curriculum policy as a lens through which to understand political and social transition in postcolonial Africa. In other words, what is studied is how curriculum reform illustrates the tensions between change and continuity in postcolonial societies. More recently, studies of curricula in Africa focus on policy borrowing. This includes transnational policy borrowing whereby curriculum policy is imported from elsewhere into African countries, such as the case of outcomes-based education in South Africa. But policy borrowing also occurs between African countries such as South Africa's National Qualifications Framework (NQF), which is now being used by Kenya. The most recent trend in African curriculum studies is examining how societies emerging from violent conflict do or do not use curriculum policy for asserting a political vision for a new society

### Conclusions

Some attention has been devoted to the study of curricula in Africa, particularly since the achievement of independence by most countries. The main focal points of the study of curricula relate to the transition from colonialism, the challenges of nation-building and legitimizing new states in

postcolonial Africa. These studies include the extent to which curricula will include indigenous knowledges, while providing opportunities for learners to develop skills that can be used in contributing to the economic development of these nations. Concerning the latter, diversification of school subjects has been a key point of focus. Furthermore, much attention has been given to curriculum innovations in African curriculum studies, but there remain questions about the motives for introducing curriculum innovations—whether they are introduced for symbolic reasons or to bring about substantive changes in education. Because assessment and examination systems often placed constraints on curriculum change, these areas also feature prominently in studies of curricula in Africa.

There are also more recent trends. In a rapidly globalizing world, policy borrowing occurs. But there have also been recent trends that focus on African conditions, that is, how the curriculum is (re)imagined in postconflict societies and how a curriculum might be used as a lens to understand social transition.

Finally, although there is evidence of the study of curricula in Africa, this field remains underdeveloped in all countries. There are no dedicated journals, and there are no strong socio-intellectual communities constituting the field. Even in a country such as South Africa, where scholarship is reasonably strong, the field is fragmented.

---

## AIDS EDUCATION RESEARCH

---

Curriculum scholars must address acquired immunodeficiency syndrome (AIDS) because of its enormous impact on human lives and because the competing representations of AIDS offer opportunities to redefine, in more exclusive or inclusive terms, what it means to be a citizen, a human, and a sexual being. AIDS curricula also offer lessons about the complexity of knowledge and the limits of commonsense curricular approaches. AIDS is a life-threatening virus transmitted via bodily fluids. AIDS was recognized by the U.S. Centers for Disease Control in 1981 but obscured as a gay men's disease until popular culture icons Freddie Mercury of the rock band Queen and basketball legend Magic Johnson became public faces of the disease. Southern Africa is the epicenter of the disease today, with a persistent infection rate greater than 30%. There is no cure for AIDS, but under the right conditions, the disease can be managed and lives prolonged by continuous health monitoring, a nutritious diet, and drug therapies. Because treatment is not universally available, preventing

new infections has become the primary health initiative, and education is central to these efforts. However, AIDS education encounters many obstacles including the continuing stigma of AIDS, lack of political leadership, the design of the curriculum, and the desire of many to remain ignorant of issues related to sex, illness, and death.

Worldwide, education is still the central intervention/prevention against human immunodeficiency virus (HIV) and AIDS. However, education has, in general, not prevented new infections. Education alone cannot overcome stigma and the absence of political leadership. The dominant curricular approach in developing countries also has limitations. The "ABCs," an acronym for programs that emphasize abstinence, being faithful, and condom use, highlight knowledge of the virus, groups at greatest risk for infection, and safer sex practices. The ABCs conform to a biomedical model of public health, which views sexual practices separate from socioeconomic and cultural contexts and uses a rational model of behavior change. The ABCs pedagogy is weighted toward conveying facts about HIV/AIDS, and these facts are believed to possess the power to change behavior. Most national AIDS prevention programs are designed according to these biomedical models of individual risk and rational behavior change, and they have not been successful. In addition to the drawbacks of the curricula, teachers and students may avoid discussing HIV/AIDS for its associations with sexuality, illness, and death or with people deemed of lower social, racial, or moral status.

Teachers (in U.S., Australian, and European studies) believe that HIV/AIDS is an important topic for all grades, but feel unprepared to teach AIDS and sexuality. Specifically, teachers feel least comfortable with social, emotional, and societal issues and most prepared to discuss factual information such as HIV transmission. Additionally, teachers report discomfort with more interactive teaching strategies, such as role-playing, problem-solving activities, and small-group discussions. Finally, research confirms that teachers have limited inservice and preservice education in HIV/AIDS and sexuality education. Generic recommendations for greater teacher training on HIV/AIDS and sexuality conclude most studies. But this research story about teachers' experiences requires

critique and contextualization. Studies do not probe the nuances of teachers' discomfort, for example, its sources, its manifestations in the classroom, or its school, societal, and political contexts. This latter omission is particularly striking, given the intense political climate around sexuality in most countries, where conservative viewpoints have cemented an approach to sexuality education that is carefully regulated and abstinence centered. In stating narrowly the problems that face teachers in teaching HIV/AIDS, the "solutions" are likewise narrowed to increased teacher training. Consideration of potential changes in the wider context of schools and society is elided.

One significant omission in studies of AIDS and teachers is an understanding of the multiple discourses of HIV/AIDS in circulation in news coverage, public policy statements, health initiatives, curriculum, and children's books. Because HIV/AIDS exists at the intersections of sexuality, morality, and health, it produces what has been called an *epidemic of meanings* alongside the *epidemic of a life-threatening virus*. AIDS has been interpreted as a punishment for immorality, a Western pharmaceutical plot against Black African sexuality, and a re-statement of racist views of racial inferiority, among others. In general, teachers and curricula, in both developed and developing contexts, adhere to the biomedical discourse on HIV/AIDS, considered to be neutral and scientific, and eschew political, public service, and explicitly moral views of AIDS.

Despite the staggering consequences of the HIV/AIDS pandemic for world health, economics, politics, and justice, AIDS education has been stunted by a narrow focus on neutral scientific facts, individual behavior change, and rational decision making. Furthermore, AIDS education has been undermined by a lack of broad political will, cautious approaches to sexuality, and neglect of the multiple registers and meanings of HIV and AIDS. In conclusion, AIDS education tends to *overestimate* the inherent power of "the facts" to effect change and to *underestimate* the enmeshment of safe sex education in political, economic, gender, and social networks of meaning.

## ALBERTY, HAROLD

---

Harold Alberty (1890–1971), professor of education at the Ohio State University, had a remarkable career that spanned the progressive education movement in the United States as well as the neo-progressive curricular practices that emerged toward the end of his life in the late 1960s and early 1970s. Alberty profoundly influenced the field of curriculum studies through his most widely cited text, *Reorganizing the High School Curriculum*. In his book, Alberty described curriculum integration across a continuum that illustrated how content knowledge can be organized to achieve more or less integration of major concepts, skills, beliefs, and so on. Although some scholars suggest that there were six types of curriculum integration in Alberty's model, the preponderance of curriculum theorists describe five major types ranging from the least integrative to the most integrative.

The Type One design was the separate subjects approach in which content was dispersed into curricular "silos" that had little, if any, relationship with other content areas. This was essentially the model for the high school curriculum envisioned by the Committee of Ten in 1898 and was largely driven by the traditional disciplinary structure of colleges and universities. This design was based on separate courses (algebra, chemistry, Spanish, U.S. literature, U.S. history) that students took in a segmented, fragmented structure. The Type Two design, which has been labeled as a correlated curriculum, provided the opportunity for teachers to temporarily integrate two distinct courses, usually by creating

teaching units that linked, for example, U.S. literature and U.S. history by having students read *The Grapes of Wrath* in U.S. literature class while studying the Depression in U.S. history. Each teacher taught separately but planned their units jointly.

The Type Three design became known as the fusion model because courses were actually created that permanently connected two or more separate subjects. So, botany and zoology became biology; geography and geology became earth science; history, economics, political science, and geography became social studies; English, speech, and drama became language arts; and so on. Content could also be fused through thematic units within these courses by connecting language arts and social studies, math and science, social studies and science, and so forth, through thematic blocks covering the entire morning, afternoon, or full day. The Type Four and Type Five designs constituted the “core curriculum” either in a preplanned core that was focused on common societal problems (e.g., war, pollution, global warming, terrorism) or problems that adolescents would frequently experience as part of their developmental cycle. The Type Five design was considerably more student centered than the Type Four design, which was problem based. The Type Five design allowed teachers and students to cooperatively plan the student’s learning experiences by using learning contracts or similar types of negotiated agreements.

Although Alberty’s model for reorganizing general education was targeted to the high school curriculum, his greater influence may have been on the postsecondary curriculum and the middle school curriculum that emerged in the 1960s. Certainly, the middle school curriculum model created by Gordon Vars and John Lounsbury drew heavily from Alberty’s concept of the general education core curriculum, and many colleges and universities make frequent reference to their general education “core” classes although their use of the term *core* differs from Alberty’s original concept. Many agree that Alberty’s views on curriculum design, democratic education, curriculum integration, and the core curriculum are still relevant and are still central to the study of curriculum development at all levels.

Although Alberty began his career as an educator while still a student at Baldwin University (Baldwin-Wallace College) in 1912, his interests

soon turned to law school where he completed his graduate degree in 1913 at the Cleveland Law School. His love of teaching and desire to practice law drew him to seek advanced graduate work in educational administration at The Ohio State University where he came under the influence of Boyd Bode, a disciple of John Dewey’s, who profoundly affected Alberty’s philosophy, beliefs about teaching and learning, and ultimately, his career. Bode saw in Alberty an intellectually gifted and highly analytical thinker, and Alberty found Bode to be a challenging yet beloved professor who would provide him with an assistantship in the department that would later evolve into a faculty position. Through Bode, Alberty found a mentor and a philosophical connection to the experimentalism of Dewey and his contemporaries in the progressive education movement.

Initially attracted to the writings of W. W. Charters and his emphasis on activity analysis, perhaps because of Alberty’s own analytical approach to thinking, by the early 1930s, Alberty was beginning to meld the Deweyan notions of democracy in the classroom and the school as the vehicle for engaging students in the realities of democratic citizenship with the problems of providing a general education for all learners. As a result, through his work on the Eight Year Study first as a staff member on the study’s curriculum team and then as a member of the study’s committee that reported on the role of science in general education, Alberty became acquainted with the views of Wilford Aikin, director of the Eight Year Study. These various experiences helped form Alberty’s thinking about general education, curriculum integration and, ultimately, the core curriculum that provided the basis for his curricular model of general education in *Reorganizing the High School Curriculum*, published in 1947, 1953, and 1962 with the third edition co-authored with his wife, Elsie Alberty.

As a result of Alberty’s work on the Eight Year Study and his desire to implement the concepts and practices he had formulated regarding the organization of content knowledge in the curriculum, he became attracted to the directorship of The Ohio State University School, where he served from 1938 to 1941 as the school’s director and instructional leader. He also helped formulate a position paper for the Progressive Education Association

(PEA) in 1941 in which he attempted to strike a balance between the child-centered wing and the social reconstructionist wing of the PEA. By all accounts, this attempt was a dismal failure, and the schism between the two factions set the stage for the decline of the PEA.

## ALTERNATIVE SCHOOLS

---

Alternative education has been an integral part of public education in the United States since the 1830s; however, alternative education became a widespread movement across the country during the 1960s to 1970s. Fueled by the social discontent of the populace and the marginalization of many of U.S. youth, advocates of alternatives to the traditional public school structure became more vocal and more socially and politically active. Today, alternative education and alternative schools are a significant part of public education.

Much of the philosophy behind alternative education can be traced back to Jean-Jacques Rousseau who believed education should parallel a child's growth not society's need, and to the progressive era of education where people like John Dewey and Francis Parker thought children's education should serve their needs and interests and focus on understanding, action, and

experience rather than on rote memorization and accumulation of factual knowledge.

The purpose of public alternative education/schools is to provide different approaches to teaching and learning that enhance the opportunities to learn for students who do not function well in the "state approved" programs found in the traditional public schools. The ideals of public alternative schools include diversity, autonomy, and providing school choice.

In 1970, Charles Silberman published *Crisis in the Classroom*, based on a Carnegie-funded study of U.S. education. This book substantiated the growing discontent of parents and educators with the status of public education in the 1960s and stimulated the support for public alternative schools. Silberman's focus for reform was to make schools more humane with more attention on students' interests, desires, and concerns.

By the early 1970s, the federal government became more involved in developing public alternative education programs. In 1970, the White House Conference on Children called for massive funding for the development of alternative forms of public education. Title III funds from the Elementary and Secondary Education Act of 1965 were used to establish public alternative schools. The Experimental Schools Program (ESP) sponsored by the Office of Education was a huge effort to develop public alternative schools. Eight planning grants were approved; the three largest were for the Berkeley, California, Schools; Minneapolis Schools; and Seattle-Tacoma Schools. The Educational Alternatives Project (EAP) at Indiana University held a series of meetings and conferences on the development of alternative education programs. The initiative had three thrusts: (1) encouraging major professional organizations to include alternative public schooling in their national programs, to publish articles in their professional journals, to encourage private foundations to support public alternative education, and to organize conferences on public alternative education; (2) the development of the Alternative School Teacher Education Program, a graduate program that placed students in public alternative schools for their internships; (3) the creation of the International Consortium on Options in Public Education (ICOPE), which published the newsletter, *Changing Schools*, that shared information on public alternative schools, conferences on

public alternative education, and reviewed books, program descriptions, and research reports on public alternative education programs and initiatives.

Also during the early 1970s, various state departments of education supported the development of public education alternatives. Most of these programs were compensatory in nature and strongly supported by businesses, state governments, and federal agencies. By 1973, 30 states offered some form of public alternative education programs or schools.

In 1975, Robert Barr created a categorization of the types of alternative schools that were developing. Although true alternative schools were supposed to be based on free choice of attending, he discovered that the largest number of alternative public schools, continuation schools, were designed to deal with “behavior problems” where students were assigned to attend these schools. Other types of schools included Learning Centers, which focused on specific skills or knowledge such as vocational education, health studies, technology, and so on, in addition to a full academic program; Schools Within Schools divided a large school into smaller communities each focusing on different approaches to teaching and learning to best meet the diverse school population; Open Schools, often described as child centered, that built curriculum around the experiences children brought to school and organized around learning or resource centers; Schools Without Walls, which used community-based learning experiences and community resource people to provide the guidance and instruction; Multicultural Schools with ethnically and racially diverse populations and a curriculum that valued cultural pluralism including courses such as Native American Studies, Women Studies, or African American Studies; Free Schools that subscribed to the principles of democracy including students’ active engagement in setting learning goals and activities in a humane and caring sense of community; Others, those schools that because of their amalgamation of methods did not fit into the other categories. Newer alternative schools such as fundamental schools, magnet schools, and charter schools would best fit into this category.

The alternative education movement provided parents with multiple conceptions of what a good education means. Recent government, industrial, and public desires to standardize curriculum and testing as a means of evaluating a school’s

performance have challenged alternative schools to function according to these societal basic beliefs and meet the new accountability standards. However, the overpowering desire to democratize the schools by providing school choice to ensure all students have equal opportunities to receive a quality education will continue to guide the future of alternative education.

The 1960s through 1970s changed the mosaic of public education. The one-size-fits-all concept of education is no longer valid. According to Robert Newman, this was the legacy of the public alternative school movement.

## AMERICAN ASSOCIATION FOR TEACHING AND CURRICULUM

---

The American Association for Teaching and Curriculum (AATC) was founded October 1, 1993, as a national learned society for the scholarly field of teaching and curriculum. Although many universities had established departments of teaching and curriculum before the end of the 19th century, the scholarly field of curriculum and instruction was not represented in the transformation of U.S. scholarship that began during that same period.

---

1995	O. L. Davis, Jr., University of Texas at Austin	2004	David Flinders, Indiana University
1996	Francis Hunkins, University of Washington	2005	Cheryl Craig, University of Houston
1997	Ann Converse Shelley, Ashland University, Ohio	2006	William Veal, University of Charleston
1998	Sylvia Hutchinson, University of Georgia	2007	Alan W. Garrett, University of Eastern New Mexico
1999	William Segall, Oklahoma State University	2008	Karen Riley, Auburn University at Montgomery
2000	Stephen Fain, Florida International University	2009	Robert Boostrom, University of Southern Indiana
2001	P. Bruce Uhrmacher, University of Denver	2010	David Callejo-Perez, University of West Virginia
2002	Ron W. Wilhelm, University of North Texas		
2003	Gretchen Swarcz, University of Oklahoma, Tulsa		

---

Thus, AATC founders John A. Laska and O. L. Davis Jr., both professors at the University of Texas at Austin at the time, sought to create a professional organization to promote the idea of the scholarly study of instruction and curriculum development at all levels of education.

AATC promotes scholarship in teaching and curriculum through its conference and journal, *Curriculum and Teaching Dialogue*, published yearly by Information Age Publishing. The editorial advisory board of the journal is composed of Michael Apple, Jean Clandinin, William Reid, Thomas Barone, Elliot Eisner, and Steve Selden.

Both venues encourage the use of all analytical and interpretive approaches appropriate for the scholarly study of teaching and curriculum.

Since 2002, AATC has recognized the contributions of young scholars with annual distinguished dissertation awards in teaching or curriculum. Past recipients of the award in curriculum include Wesley Null, Stacey Elsasser, Donna Spirka, Stephanie Soliven, Michelle Sharpswain, Shijing Xu, and Steven Fleet. Recipients of the award in teaching include April Luehmann, Sarah Ramsey, Sandra Musanti, Mark Seaman, and Sherri Colby.

AATC annual conferences have featured keynote addresses by internationally recognized scholars such as Michael Apple, William Ayers, C. A. Bowers, D. Jean Clandinin, Renee Clift, Michael Connelly, O. L. Davis Jr., Robert Donmoyer, Eleanor Duckworth, Elliot Eisner, Geneva Gay, Carl Glickman, Maxine Greene, Madeleine Grumet, Burga Jung, Wilma Longstreet, Nel Noddings, William Pinar, William Reid, William Schubert, Steve Selden, and Suzanne Wilson.

John A. Laska served as the first secretary-treasurer of the organization. The position of executive secretary was then created, and Marcella L. Kysilka, University of Central Florida, served in that position from 1998 to 2008. Presently, Lynne Bailey, American Public University System, serves as executive secretary.

Susan C. Brown, Portland State University and University of Central Florida, and Barbara Slater Stern, James Madison University, served as first editor and associate editor, respectively, of *Curriculum and Teaching Dialogue* from 1999 to 2005. Currently, Slater Stern serves as editor, and James Moore, Cleveland State University, serves as associate editor.

Presidents of AATC have included the those listed at the top of the page.

## AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF CURRICULUM STUDIES

---

The American Association for the Advancement of Curriculum Studies (AAACS) was established in

2001 as an affiliate of the International Association for the Advancement of Curriculum Studies (IAACS). The AAACS, like its parent association, adopted as its mission the promotion and progress of curriculum studies as an academic discipline and field of study. AAACS is an advocacy organization that promotes the development of strong and viable curriculum studies departments and associations across campuses throughout the United States. Directed primarily at the faculties of institutions of higher learning in the United States, the AAACS advocates the continuation and strengthening of the field of curriculum studies as an interdisciplinary source and method of inquiry intended to foster a rigorous and scholarly conversation concerning curriculum, teaching, and learning.

Recognizing the importance and inevitability of the internationalization of curriculum studies, AAACS desires the conversation concerning curriculum in the United States to be informed by issues in other countries around the world, and to inform those conversations with thought and research from the United States. And though its local developments and constructions differ widely across borders, AAACS recognizes that curriculum studies is an international disciplinary field, and the organization recognizes that curriculum is a local project with national and even parochial contents and contexts.

To facilitate this conversation, the AAACS advocates the establishment of local curriculum units at colleges and universities. These units would actively engage in maintaining rigorous courses of studies in curriculum, advocate for the continuing strength of the field, and sponsor local projects to develop learning and research in the field. Such projects would derive from specifically designated and local curriculum studies units. These units would advocate for hiring of faculty with expertise in teaching curriculum courses, for undertaking collaborative research projects, to facilitate the development of regular and special local events to promote the continuation of complicated conversations on campuses, and to inspire the intellectual development of curriculum scholars and students in the advancement of the field of curriculum studies.

Acknowledging historical memory, the AAACS hopes to advance the field by drawing into the conversations essential texts that have been important to the development and advancement of the field of

curriculum studies. To this purpose, the AAACS established the Canon Project in 2007 to develop a curriculum bibliographical mapping of texts central to the field of curriculum studies.

The AAACS sponsors a yearly spring conference, bringing together curriculum scholars from across the United States and around the world to engage in complicated conversations about the field of curriculum studies in its efforts to advance the field. AAACS also promotes its agenda in the sponsorship and publication of the online *Journal of the American Association for the Advancement of Curriculum Studies*.

## AMERICAN EDUCATIONAL RESEARCH ASSOCIATION

---

The American Educational Research Association (AERA) started in 1916 as a national organization for education researchers with the aim of strengthening education through research. Since then, it has grown into a worldwide professional membership organization with more than 25,000 members. AERA has an expressed goal of advancing

high-quality educational research and fostering excellence in its reporting for scholarly productivity and practical application. This goal is further interpreted in the mission to advance knowledge about education, to encourage scholarly inquiry related to education, and to promote the use of research to improve education and to serve the public good. To realize this mission, AERA provides its members with multiple forums for open expression of ideas and discussion in response to the needs of members and to advance the field.

### The Members

The membership of more than 25,000 is richly diverse in academic preparation, professional roles, and scholarly interests. Members represent university and college faculty, graduate students, leaders and practitioners in school systems, policy makers, counselors, testing and evaluation professionals, and representatives from federal, state, and local agencies. AERA is well recognized as comprehensive in representing a cross section of education scholars from various areas of study compared with other organizations that represent a singular focus (e.g., mathematics, science, reading). This society's mission and scope attract other disciplines outside of education such as psychology, history, sociology, economics, philosophy, anthropology, and political science.

### The Organizational Structure

The scope and diversity within AERA necessitates a focused, yet responsive, organizational structure to unite members into smaller, meaningful groups with shared professional and research commitments. Thus, members are further organized into 12 divisions and more than 160 special interest groups (SIGs) that facilitate meaningful, substantive professional/scholarly communities. The number of divisions and SIGs has changed over the history of the organization in response to member interests and advancements in the field. The current divisions are:

- Division A: Administration, Organization & Leadership
- Division B: Curriculum Studies
- Division C: Learning & Instruction

- Division D: Measurement & Research Methodology
- Division E: Counseling & Human Development
- Division F: History & Historiography
- Division G: Social Context of Education
- Division H: Research, Evaluation & Assessment in Schools
- Division I: Education in the Professions
- Division J: Postsecondary Education
- Division K: Teaching & Teacher Education
- Division L: Educational Policy & Politics

A committee and officer structure provides additional member opportunities for engagement and leadership. AERA is governed by a legislative and policy-determining body called the council, which comprises elected members and the president, president-elect, immediate past-president, two members-at-large, vice presidents of each of the 12 divisions, chair of the SIG Executive Committee, and the chair of the Graduate Student Council. The AERA executive director serves as the ex-officio member of the council.

### The Program

The AERA annual meeting is the most widely attended program of the association with more than 13,000 attendees each spring. The annual meeting hosts researchers from around the world who present in various session formats that have changed over time to represent the diversity of knowledge, research, and ideological paradigms and assumptions of the membership. There is particular attention paid to using these formats to provide comment and critique to scholars to advance the quality of research, to stimulate discourse, and to improve education. In addition to the numerous sessions, the annual meeting also includes various professional development seminars, an address by the president, awards, and session/activities for each division and SIG.

The AERA peer-reviewed journals also widely disseminated and recognized include *Educational Researcher*, *American Educational Research Journal*, *Educational Evaluation and Policy Analysis*, *Journal of Educational and Behavioral Statistics*,

*Review of Educational Research*, and *Review of Research in Education*. Other publications are produced based on important education and research imperatives.

Other AERA programs include the Annual Brown Lecture in Education, introduced in 2004, the year of the 50th anniversary of *Brown v. Board of Education*. The *Standards for Reporting on Empirical Social Science Research* published in 2006 promotes high-quality education research. Four fellowship and grants programs are offered: The AERA–American Institutes for Research (AIR) Fellows Program, the AERA–Educational Testing Service (ETS) Fellowship Program in Measurement, the Minority Fellowship Program in Education Research, and the AERA Grants Program.

### A Statement on Curriculum Studies

Curriculum studies is a prominent division among the 12 in the society. A small group of approximately 45 with an interest in curriculum knowledge started to meet at AERA in 1973 and called itself The Creation and Utilization of Curriculum Knowledge. This group grew to 300 members and changed its name to Critical Issues in Curriculum. The division is now titled Curriculum Studies and builds on its predecessors in providing space for the study, scholarship, and discourse of curriculum.

## AMERICAN EDUCATIONAL RESEARCH ASSOCIATION DIVISION B

---

American Educational Research Association (AERA) Division B focuses on the field of curriculum studies.

The origins of Division B stem from 1963, the year AERA President N. L. Gage appointed a five-member division planning committee. One member of that group, John R. Mayor, was asked to chair an organizing committee for “Curriculum and Objectives,” which became the original title for Division B. Mayor recommended four others to serve on the division’s organizing committee, of which Vernon Anderson and Robert Gagne were selected. With a budget of \$100, the division held its first meeting at the 1964 AERA annual meeting in Chicago. As a founding division, Curriculum and Objectives was assigned its letter designation alphabetically (following Division A: Administration). That same year, John I. Goodlad was elected the first Division B vice president. B. O. Smith served as the division’s first secretary.

A statement written by Anderson and Gagne at the division’s founding sought to specify efforts to promote research in the area of curriculum and objectives. With an emphasis on interpreting research for school practice and increasing the general public’s appreciation of curriculum research, the group sought to schedule regular meetings to present research and to establish more interdisciplinary approaches to curriculum inquiry. Since its inception, Division B has reflected the multiple and often competing goals of the curriculum field at large. In particular, the division was conceived not only as a venue for research. Its charge also included cooperating with other groups, interpreting research for practitioners, and helping the public understand the applications of research. Casting this broad net fit well with the field’s long-standing efforts to employ an expert model in the work of curriculum professionals—a model that relied on interdisciplinary knowledge to solve practical problems. From Edward L. Thorndike to Franklin Bobbitt, those who shaped the early development of the field aspired to the use of research and professional expertise as a guide to educational practice.

This expert model was particularly strong preceding and during the decade in which Division B was founded. The inclusion of the term *objectives* in the original division title signaled an affiliation with the practical affairs of schooling. At that time, objectives were a key element in systematic approaches to program development, and the

*Wayne J. Urban*

word alone raised images of highly trained experts guiding school districts through the process of defining their objectives. In the aftermath of *Sputnik*, moreover, school curriculum was perceived as woefully out of date, whereas faith in modern techniques promised ways in which to help schools catch up with the times.

By the 1970s, however, the expert model began to fall out of favor among Division B members. Tensions arose from the very purposes that Anderson and Gagne's statement sought to embrace. On the one hand, many curriculum scholars were drawn to emulate the social sciences. Under the sway of AERA's emphasis on positivism and experimental science, these scholars found themselves identifying not with school practitioners but with researchers in the cognate disciplines of psychology, behavioral science, and sociology. For this group, the need for rigor came to trump the need for relevance.

Another source of tension accompanied the rise of reconceptualism. This movement drew on

philosophy, politics, and social criticism to suggest that the expert role in curriculum and its dictates for practice was illusionary at best and oppressive at worst. The purpose of curriculum scholarship was not to tell teachers what to teach or to inform top-down policies. Instead, the reconceptualists set out to examine how curriculum decisions are made, by whom, and for whose benefit. Curriculum was to be studied, not foisted on those with relatively little power.

Reconceptualist scholarship continues to occupy a major role in Division B. The other prominent purposes—scientific research and support for program development—are also secure in the contemporary landscape of the division. Many scholars see this inclusiveness as the result of difficult tensions that have come with the growth of the division and of AERA as an organization. Although this may be the case, the seeds of the division's current inclusiveness were essential from the start.

## AMERICAN EDUCATIONAL RESEARCH ASSOCIATION SIG ON CRITICAL ISSUES IN CURRICULUM AND CULTURAL STUDIES

---

The American Educational Research Association (AERA) is the premier professional association for academics in the field of education in the United States. Within this organization a structure exists that enables a variety of ways to engage in the association. For example, special interest groups (SIGs) in AERA are spaces for unique and specific windows into contemporary scholarship and move within the larger fields of education addressed by the major divisions in the organization. It takes a group of dedicated AERA members to develop a proposal and circulate a petition among like-minded members to gain permission to create a SIG. The Critical Issues in Curriculum and Cultural Studies SIG is one such historic window of contemporary scholarship. It was developed to provide a more flexible space within the larger organization for reconceptualist curriculum scholars to share and discuss their work that addressed theoretical issues and research studies framed by a critical approach centered on questions of power and exclusivity in curriculum. This was a historic move within and against the more traditional notions of curriculum that, at that time, framed the larger structure

of Division B (Curriculum). The SIG provides a welcome place for graduate students and established scholars to network and to learn from each other regarding the latest fringe efforts of the field of curriculum.

Originally, the SIG was titled Critical Issues in Curriculum Studies. However, it evolved over time to include scholars and research in the area of cultural studies in education. Thus, the SIG developed into the current group with the addition of “Cultural Studies” to the title. According to the AERA Web site for the SIG, this group supports transdisciplinary research in education focused on experience and understanding. It works to destabilize traditional boundaries in the field of curriculum. Specific areas of interest in the group include research and theory ranging from critical theory and autobiographical inquiry to postmodern theories and performative autoethnographic inquiry.

---

## AMERICAN HIGH SCHOOL TODAY, THE

---

*The American High School Today: A First Report to Interested Citizens* was published in 1959 by James B. Conant. A noted U.S. chemist, long-time president of Harvard University, participant in the development of the atomic bomb in the 1940s,

and educational commissioner of Germany in the early 1950s, Conant turned to a Carnegie Corporation-funded study of U.S. high schools as his major project after stepping down from his post in Germany.

Conant's interest in high schools was longstanding, though it should also be said that he had little experience with, and in, the institutions about which he wrote. His notoriety as Harvard president, however, made him a formidable voice in any educational arena in which he spoke. His interest in elementary and secondary education issues was cultivated through a long relationship with elementary and secondary educators with whom he served on the Educational Policies Commission (EPC), a blue-ribbon panel of U.S. educational leaders founded by the National Education Association and the American Association of School Administrators in the 1930s. Conant served several terms on the EPC and by the late 1950s when he wrote *The American High School Today*, he had spent more than a decade as an EPC member. Conant himself spoke often of the significance of his work on the Educational Policies Commission.

Of particular importance for Conant was the 1944 publication of the EPC's *Education for All American Youth*. That volume endorsed an approach to the high school that valued both the traditional academic studies that had been the backbone of the high school curriculum and the newer vocational studies that were making their way into that curriculum. Thus it should not be surprising to find in *The American High School Today* a firm endorsement of both academic and vocational education in the high school.

Conant based his findings and argument in *The American High School Today* on a study of many U.S. high schools he conducted, with a four-person research team. In this volume, Conant analyzed, and praised, the "comprehensive" high school as an institution capable of building U.S. society in the present and future. For Conant, the term *comprehensive* denoted a high school that served several groups of students under one roof. These students included those with academic talent and interest, those with vocational background and goals, those with other needs relating to commercial pursuits, and those needing education for

their futures as U.S. parents and citizens. For Conant, the key point was that only in a comprehensive high school offering a full range of curricular options were the needs of the wide variety of youth who enrolled accommodated. He added that the best examples of comprehensive high schools were found in smaller cities and some suburban locations, where there were enough students of various types to fill the spaces in classes in the various curricula. Larger cities and rural communities were prevented, largely through considerations of size, from getting a wide variety of students and offering the proper range of courses that those students needed. Conant stressed that comprehensiveness was a key in achieving the proper goals of a secondary education in a democratic society. Those goals were of two kinds: studies appropriate to the various destinations toward which the different groups of students were headed, and studies that were geared to unifying the diverse groups of students despite their varying backgrounds, abilities, and destinations.

The comprehensive high school that Conant advocated had to be sizable to generate the curricular choices that students and their needs demanded. Academically, size was important to generate the laboratories and other facilities needed to facilitate appropriate science courses both for the college bound and the noncollege bound. Size also facilitated the development of vocational courses and the provision of facilities needed for their instructional effectiveness.

Conant's grant from the Carnegie Corporation to conduct his study of U.S. high schools was given to the Educational Testing Service (ETS) for administrative purposes. Conant had a long relationship with the testing service, a relationship that was geared for both Conant and ETS to identifying talented U.S. students and providing for the academic enrichment to which he thought they were entitled. Because of this emphasis, Conant is often tagged with the label of educational elitist. His devotion to identifying and cultivating talent in all segments of the population, however, combined with his genuine respect for nonacademic studies and students, lead to the conclusion that his elitism, if it existed, was more meritocratic than it was aristocratic. Thus, the charge of elitist, although not definitively refuted, is mitigated to some extent

if one considers Conant's complete program for the high school.

## ANDRAGOGY

---

*Andragogy* is a perspective on humanistic learner-centered curriculum development and enactment that was popularized by Malcolm Knowles within the field of adult education in the 1960s, when adult education as an academic and professional field was still young, and when those involved in this professionalization were seeking to establish adult education as an important arena of study distinct from K–12 education. Knowles argued that adults learned differently from children and thus should be taught differently from children, a stance he modified during the course of his career, as he came to accept that *all* learners benefit from the learner-centered instruction championed by andragogy. As such, andragogy was initially grounded in the perception that the prescriptive curricular models used in K–12 settings were inappropriate for adult education, and Knowles positioned his work specifically as a reaction against classic Tylerian approaches to curriculum development. Whereas Knowles's approach evokes a core thematic of Deweyan and reconceptualist curriculum studies' theorizing, specifically around the involvement of learners in curriculum deliberation and learning processes, some adult education scholars see little difference between Ralph Tyler's approach and Knowles's approach because

both consist of prescriptive steps that educators *should* do in idealized educational situations, and both fail to account for the politics of curriculum as well as the social, political, and economic contexts within which education operates.

Based in the educational philosophy of liberal humanism, the prevailing approach within U.S. adult education, andragogy has been conceptualized in many ways: a set of assumptions about adult learners, a method of teaching adults, and a theory of adult learning. Critics have also described it as an ideology grounded in Western, middle-class values of individualism. The term originated in the workers' movement educational programs in 19th-century Germany and is currently used in many Central and Eastern European countries in the same way British and U.S. educators use the term *adult education*—that is, as a broad umbrella term defining a professional field of practice. In Britain and the United States, however, the term *andragogy* denotes a more specific approach to adult learning and teaching, which will be described here.

Knowles famously defined andragogy as *the art and science of helping adults learn*. Andragogy creates an image of adult learners based on six assumptions: (a) as adults mature, their self-concepts move from dependence toward self-directedness; (b) adults enter educational activities with life experience, which is a resource for learning; (c) adults are “ready to learn” when they experience a need to know something or to change a life situation—adult learning is tied to the need to perform one's various social roles; (d) learning must be immediately relevant to adult learners; (e) adults are internally motivated to learn; and (f) adults need to know why they are learning something. As a method of teaching adults, andragogy draws on these assumptions to design, enact, and evaluate educational experiences that best resonate with adult learners. Andragogy emphasizes *process* rather than *content* and focuses on adult educators as *facilitators* who are responsible for creating comfortable physical climates and welcoming psychological climates of mutual trust and respect; these teaching/learning situations should be collaborative, supportive, open, authentic, pleasurable, and learner-centered. Facilitators using andragogical methods, for instance, use “learning contracts” with learners, wherein adult learners

diagnose their own learning needs, create learning goals, identify resources, carry out their learning, and evaluate their learning. These contracts and other andragogical methods are used to foster self-directed learning and nurture a sense of autonomy among learners.

Andragogy has been mired in controversy in the academic adult education literature since Knowles first popularized the idea. Critics have questioned andragogy's assumption that adults and children learn differently and thus should be taught differently. Other debates center on defining andragogy—is it a set of assumptions about adult learners? A set of normative statements about how adult learners *should* be? A learning theory? A guide to practice? Critics have argued that andragogy falls short as a learning theory because it provides little insight into the process of adult learning. Adult educators have argued that andragogy is more useful as a guide for teaching, although they point out that the assumptions on which andragogy's teaching model is based are not universally true. In general, little empirical research has been undertaken to directly test the validity of andragogy's assumptions or the effectiveness of using andragogical methods with adult learners. Though some research has shown, for example, that almost all adults engage in self-directed learning projects, and thus we might assume adults prefer some autonomy in the classroom, research focusing specifically on andragogical methods in classrooms remains inconclusive; some speculate this results from poorly designed research.

A different sort of critique has emerged from adult educators who subscribe to more critical and sociological views of adult learning. They argue that through focusing on practical teaching techniques, andragogy positions itself as politically neutral and fails to acknowledge that knowledge is inherently value-laden and socializes and shapes behavior. Andragogy is also critiqued for promoting the illusion of a generic adult learner with White, male, Western middle-class values—individualism, self-fulfillment, self-reliance, and self-directedness—as universal. Andragogy ignores the relationship between self and society by decontextualizing the learning process and describing the individual in psychological terms separate from social, political, economic, and historical contexts. Consequently, andragogy does not

account for structural systems of privilege and oppression, based on race, gender, and class, that influence learning and does not consider how culture affects a person's development and ways of learning. Finally, because andragogy promotes itself as neutral while upholding mainstream values, it omits a critical analysis of commonsense assumptions about cultural, sociopolitical, and institutional constraints on learning; thus, it is critiqued for reproducing inequalities, for sustaining hegemonic social arrangements, and for supporting exploitative structures and conservative agendas.

Andragogy has had an enormous impact on the field of adult education and was considered the lynchpin of adult education for decades. Despite the various critiques outlined in this entry, andragogy continues to be an important part of adult education's shared knowledge base and is still arguably the most well-known idea in adult education. Although academic adult educators have turned their research agendas toward other theories of adult learning, practitioners continue to find andragogy useful as a guiding set of assumptions about adult learners and continue to practice andragogical methods in their classrooms.

## ANTIRACISM THEORY

---

Ideas about race and racism are virtually as old as the human experience. The ubiquitous presence of

these ideas certainly permeates curriculum studies in its exploration of what counts as knowledge, whose knowledge is valued, and the complex relationship between people and knowledge. Around the world, groups have been identified by racial categories that have been used to create social hierarchies employing various forms of racism. This prevailing reality does not suggest that it is natural or inherent for racism to exist somewhere at all times. In fact, perspectives on race and racism play out differently in different sociopolitical contexts and vary across time and as political, cultural, or demographic shifts occur. In many contexts and at certain times as perspectives change, diversity in race is either valued, accepted, or the basis of outright conflict. Even within such dynamic social contexts, racism seems intractable as a world issue and results in the need for continuous antiracism work at virtually every level of society, including education. The UNESCO Declaration on Race and Racial Prejudice speaks to this world issue as one that is ever changing but that is paradoxically consistent in the forms of racism, racial discrimination, colonialism, and apartheid.

### **Definitional Concepts of Race, Racism, and Antiracism Theories**

Before discussing antiracism theories, a few perspectives on race are important as an entry point even though the meanings of race are continually in dispute as an ideological concept in any sociopolitical context. This contested terrain is natural, expected, and is testimony to its active role in shaping the human experience. It also gives evidence of race and racism as permanent fissures in creating a harmonious social order.

Historic conceptions of race are complex and have long been accepted as a biological, fixed idea that is based largely on encoded phenotype (e.g., skin color, hair color and texture, eye or nose shape). From this perspective, racial variation is believed to be scientific, objective, and based in biological differences that are intrinsic, definite, and fixed. However, skin color holds prominence as the key determinant of one's race because it is permanent and a visible appearance marker. Biological differences provide ease in categorizing groups and ascribing innate DNA, genetics, and ancestry to any differences (including differences

that are not biological but that are social constructions). With the backing of science and its privileged status as truth producing, racial differences that play out as social differences are explained as innate and natural. From this perspective, race is used to explain social hierarchies and structures of injustice and inequality. For example, differences in social status are explained and justified as objectively predetermined by race. Thus, a natural social order exists based on biology and racial inferiority.

In attempts to shift from biological determinism, particularly after the gains of the civil rights movement, culture and ethnicity became frequently used concepts to replace race as the dominant discourse. This shift should have resulted in more than linguistic change. It had the potential to challenge the idea of race as biological and to embrace race as a social construction. In some instances, however, culture and ethnicity are used as referents for race, and they are viewed to be similarly fixed, distinct, and permanently assigned to certain groups in a return to biology. In still some other instances, the concepts of culture and ethnicity afforded many the safe illusion that they are avoiding race and the images and connotations that circulate with its history and racist practices. But all too often, they became mere replacements for race rather than recognizing that culture is a complex set of characteristics described by James Banks as (a) values and behavioral styles; (b) non-verbal communications; (c) perspectives, world-views, and frames of reference; (d) identification; (e) cultural cognitiveness; and (f) languages and dialects.

Although culture may have taken some hold as a discursive concept, the complexity of it as an idea has not. Race (i.e., skin color) is simple to determine in social practice, whereas culture was too complicated and less easy to identify through a single physical trait. The stronghold of the truth and the commonsense of race leaves culture as an important additional concept that would not greatly alter the strength of race as an idea that frames human difference and explains the social positions of different groups and that pathologizes some groups.

Even more recent challenges to the conceptions of race define it as a modern idea with no genetic basis because human subspecies don't exist. Here

race is defined as a social construct rather than a biological reality. In *Race: The Power of an Illusion*, medical doctors, a geneticist, a paleontologist, a microbiologist, a biological anthropologist, and a science historian, for example, provide evidence that race is not a biological construct but is a social one. This multidisciplinary team concludes that race, although not based in biology, remains a powerful social force that shapes the realities of groups in very distinct and inequitable ways. These authors further conclude that race as biology is not real but race is still a powerful social idea that is reified in a way that distributes access to opportunities, resources, and status inequitably along racial lines. Race as a biological construct still has huge currency both in social and as a material dimensions and is employed to explain and defend who is subordinated and who is pathologized. Efforts continue to define race as a social construct and to examine how it shapes group experiences, social realities, life opportunities, economic conditions, and virtually all elements of life. Robert Terry explains that distinct racial realities are produced as a result of whiteness, power, and racism with deleterious effects on everyone. To ignore these distinct realities along racial lines sets up another invisible means to ignore (a) racism, (b) that it exists, (c) that Whites benefit from whiteness whether or not they want to and despite other oppressions they may experience, and (d) that whiteness is separate and distinct from racial prejudice because it is reinforced at the institutional and cultural levels. This establishes the importance of antiracism to challenge the negative and harmful effects of the operationalization of race through racism at both the individual and institutional levels.

The distinction between the traditional views of racism at the individual and institutional levels is critical to understanding antiracism. Individual racism has generally focused on the acts of racial prejudice and discrimination between and among individual persons or groups. This level is not unimportant and affects the quality of life and the lived experiences for individuals groups daily in negative and harmful ways. At the institutional level (which is paramount to curriculum studies analyses), racism works invisibly and insidiously through systems, such as curriculum systems and educational systems. Iris Young distinguishes

individual and institutional racism and oppression clearly as a shift from outright acts of domination and conquest to the everyday racist practices that operate throughout a society and its systems and institutions through structural phenomena. For example, at the individual level, a teacher may disallow a student from doing a report on the Black power movement because it is too political and is null in the curriculum even though it meets all of the specifications for the class assignment on selecting and analyzing a key historical example of grassroots organizing. At the institutional level, banning such topics from the school curriculum as district policy because it might stir racial disharmony reflects a structural means to support racism. Accepting Eurocentric curriculum across the United States as an unexamined, unacknowledged form of privileging White children is an example of institutional racism. It operates at the invisible, unspoken level but continually denies children from racial minority groups a curriculum that bolsters their presence in the learning experience, respects their cultural integrity, and uses their history as a foundation to their learning.

Antiracism theory is a complex set of issues interwoven with power, equity, social status, privilege, and, for curriculum studies, opportunities to learn that particularly challenge institutional racism and its many manifestations. These theories also acknowledge the role of race in social experiences, personal identities, and educational opportunities. The definitional concepts presented here call upon the traditions of critical race theory as a predominant perspective because of its emphasis on institutional structures that are racist and support racism and must, therefore, be the target of antiracism theories and practices. Derrick Bell and Richard Delgado and Jean Stefancic frame critical race theory as focused on (a) analyzing the relationship between race, racism, and power; (b) including analyses of economics, history, context, group- and self-interest, consciousness, and culture; (c) questioning the social order including equality theories and rationalism; (d) containing an activist dimension; and (e) questioning how society organizes itself along racial lines and hierarchies and how to transform society for the better. These tenets are taking hold in education discourse and have profound potential to frame an approach to antiracism.

## Antiracism and Curriculum Studies

Conceptions of race have been inconsistent as indicated. Even so, these conceptions of race raise contemplative issues for curriculum studies, and these issues have changed over time. Antiracism theories hold both philosophical and sociopolitical power to produce social change. This is precisely why antiracism is so important to curriculum studies. Antiracism theories have implications for analyzing the social structures of education and of curriculum and for articulating what should be done to ensure equitable educational opportunities and treatment of diverse racial groups in its schools.

At a fundamental level, antiracism theory is relevant to curriculum studies by first acknowledging that school curriculum is not benign but is always imbued with culture, language, and power. Curriculum studies was once thought to be predominately prescriptive and limited to the study of subject matter only. And that subject matter was thought to be a preset fund of accumulated objective knowledge to be passed on to students. Many contemporary schools do not believe that curriculum is objective. It is grounded in various worldviews or sets of beliefs about the world, social relations, schools, and students. It is based in conceptions of what counts as school knowledge, what is worthy to be known, and who deserves to know what. It is either inclusive of, responsive to, and effective for racially diverse students or it serves as an institutional tool that is exclusive, nonresponsive, and ineffective for racially diverse students. Therefore, curriculum studies can reinforce racism or challenge racism as a key element of educational systems.

Many argue that curriculum has been and continues to be used to maintain racism. This occurs through what is taught (a Eurocentric curriculum), what is not taught (multicultural curriculum), curriculum implementation (dominant pedagogies), and the language of curriculum (English dominant). Efforts have been exerted to challenge curriculum as a tool of racial discrimination and oppression. These antiracism challenges are related to other curricular considerations, all focused on providing quality education and equitable education for diverse groups in diverse societies and diverse schools. For example, Carl Grant suggests that multicultural education is a humanistic concept connected to principles of equality, human rights, and social justice. James

Banks stresses the importance of multicultural education to reform schools so that diverse groups experience educational equity. Gloria Ladson-Billings characterizes culturally relevant pedagogy as a means to use student culture to maintain it and to transcend the negative effects of dominant culture and to prepare students to effect change in society. These curriculum reforms illustrate the active role of curriculum studies in antiracism work. And recent work connecting curriculum studies to critical race studies magnifies the significant role that curriculum studies plays in challenging racism and promoting antiracism. This may give lead to “critical curriculum studies” as a subset of curriculum studies in general.

What might frame critical curriculum studies? Curriculum studies as a field is distinctively qualified to ask what is worthy to be known and why. This question is often thought of as the quintessential question that guides the field philosophically. As a participant in the antiracism struggle, curriculum studies can increasingly ask what is worthy to be known and why and according to whom, whom does it privilege, whom does it disadvantage, how can it be pluralistic, and how can it challenge racism in its many manifestations. The five faces of oppression (exploitation, marginalization, powerlessness, cultural imperialism, and violence) advanced by Young represent a more precise analytical framework for analysis of antiracism. Critical curriculum studies could examine how these are manifested throughout education. Using this framework would result in such questions as these:

1. What is the role of curriculum in maintaining class structures that increasingly shape access to equal citizenship?
2. How does curriculum reinscribe social divisions?
3. How does curriculum buttress cultural imperialism at the expense of denigrating others?
4. How can curriculum unmask the unspoken and for some, unseen, fears that maintain the isms of our society?

Curriculum can play a considerable role in analyzing the relations of power and critically analyzing how racism works and how it is manifested materially to maintain inequities and injustice.

Curriculum can continue to interrogate and oppose social relations that produce racism in invisible and explicit ways every day across the world.

## AOKI, TED T.

---

Ted T. Aoki is well known for his powerful performative pedagogy that discloses his own struggles

as a way of hermeneutically, phenomenologically, and poststructurally dwelling in the gaps between theory and practice. His career began as a teacher in the Alberta public school system (19 years) before joining the faculty of education at the University of Alberta (U of A). He later became the department head of secondary education (7 years) at the U of A. During his retirement, he became adjunct professor at the University of Victoria as well as at the University of British Columbia; he maintained his strong dedication to preservice and inservice education at each university. However, during his tenure at the U of A he worked with Max van Manen, a graduate student, who pushed the limits of writing a dissertation by writing a phenomenological study. This marked the beginning of a shift at the U of A under Aoki's leadership. Also during this same period, William F. Pinar began writing about *currere* as a form of movement in curriculum and pedagogy. Aoki joined Pinar (and others) in the reconceptualist movement within the field of curriculum studies. His work with these influential scholars explains why Aoki is known as a phenomenologist and poststructuralist; however, he is best known for dedicating his career to examining the theory/practice divide. In particular, his scholarship argues for de-centering ideas while not erasing prior conceptual understandings. These pursuits have led him to study the etymological meanings of words and the semiotics of language structures. Many believe his semiotic scholarship will become his legacy over time.

During his career, Aoki reconceptualized the traditionally understood notion of curriculum implementation as a bureaucratic device to be curriculum as a form of communicative action and reflection set within a community of professionals. Arguing against instrumental action, he discusses situational praxis as an alternative. Curriculum implementation becomes a way of bridging the gap between curriculum-as-plan and curriculum-as-lived.

Aoki is adept at bridging the theory/practice divide. Indeed, he also bridges the traditional and reconceptualized fields of curriculum studies. Aoki explores the in-between spaces between many practices, such as implementing technology *and* the language of the situation, and calls this in-between space a third space. To study this space, he advocates

a mindfulness that allows individuals to listen to what the situation is asking. Aoki's point is not to overcome the tension between curriculum-as-plan and curriculum-as-lived, but rather, to dwell within it. Following a phenomenological ethics, his work often describes teaching as thoughtfulness and teaching as watchfulness, urging teachers to reach into their autobiographical memory and lived experiences. He encourages educators to linger in the multiplicity that plays within the curricular landscape, asking them to study the effect of their identities on our being and becoming. In doing so, he does not stress "either/or" but rather "and," thereby legitimating thoughtful everyday narratives.

Working in second language education, Aoki understands bilingualism as a hermeneutic dialectic where education is inherently a bilingual matter occupying the lived *and* educational spaces between mother *and* additional languages, thus resisting cultural assimilation. Moving beyond binaries and dwelling in the "and," Aoki cautions us to resist dualisms.

Working from the premise of responsibility before freedom and rights, Aoki suggests that the triad of teacher-centered, subject-centered, and child-centered curricula constitutes a triad that exists in every pedagogical situation. Educators need to abandon the ideas that classroom life exists *in* the teacher, *in* the subject, or *in* the child, but rather between and among them. Thus, Aoki advocates de-centering (a poststructuralist idea) these ideas without erasing them within the language of pedagogy.

Aoki is well known for his scholarly investigation of the etymological meanings of words we have taken for granted. For instance, examining the word *interest* (what *interests* the learner?), he suggests that it is derived from "inter/esse" meaning to be in the in-between. Thus to dwell in the place of difference allows something different to be created in a middle space. The voices rising from this in-between space share an interlude (another idea often used in Aoki's writing). Aoki worries that tolerance tends to be indifferent to community *as* difference, which leads him to describe interspaces of difference existing in each person. Examining the binary between East and West, Aoki enters the world of semiotics and introduces the concept of metonymy (using the name of one thing for

another), suggests that pedagogy is the fold between curriculum-as-plan and curriculum-as-lived, and claims that presence *is* absence. Juxtaposing various binaries (e.g., Western knowledge/aboriginal knowledge; translation/transformation), Aoki attempts to create new curricular language with the use of the "/", a space that is neither vertical nor horizontal, but is both *and/not*, a space of generative possibilities. Aoki would say this is an inspired place for being and becoming. Aoki recalls his wife June Aoki's calligraphy representing presence/absence: a metonymic contiguity of "is not" that critiques the hegemony of representational discourses that attempt to erase nonrepresentational discourses. Aoki's writing is filled with metaphorical images like this. Yet Aoki's use of metonymy is most striking. Here, the metaphor represents the vertical (fixed) and the metonym represents the horizontal (not fixed). Aoki uses both to understand curricular discourse.

Aoki is always teaching. Most of his essays began as speeches in which he taught complex ideas to educators in ways they could understand: His work serves as a bridge (used as a noun and verb) between theory/practice.

## A/R/TOGRAPHY

---

A/r/tography is a form of practice-based research that is steeped in the practices of artists, researchers, and educators. Using the understanding of *currere* (curriculum as verb instead of a noun) as a basis for this work, the practices are viewed as active, contextually situated, and creative while recognizing that subjectivity transforms objectivity. This entry describes a/r/tography as a research methodology and as a process of *currere* that leads to deep learning.

A/r/tography as a research methodology is reflective, reflexive, recursive, and responsive. Bringing the arts and graphy (writing text) together, a/r/tography also performs itself by persisting in using forward slashes to represent folds between the broadly conceived identities of artist, researcher, and teacher (educator/learner). These folds are contiguous representations of identities colliding, merging, and separating as the dynamics of a situation are revealed. Although action research has a long and extensive history in education, there is less of a history in the art world. Having said this, artistic processes are reminiscent of action research enacted as living inquiry. Beginning as an action research approach, a/r/tography pursues ongoing engagements through living inquiry—that is, continuously asking questions, enacting interventions, revising questions, and analyzing collected data, in repeated cycles. While practicing their art forms and their pedagogy, a/r/tographers are committed to knowledge creation that is rhizomatic in nature, complex in its entirety, and enhanced with aesthetic understandings. The creative practices of dancers, musicians, performers, visual artists, and other artists becomes a basis for engaging and critiquing what is learned or created. Rather than seeking to answer an initial set of research questions, a/r/tographers allow research questions to evolve as they simultaneously and continuously theorize what they are learning. A/r/tographers are committed to investigating that which is taken for granted while examining that which appears obvious. Pursuing these practices allows for a disposition of openness, creativity, and critical reflection. It is also based on the premise that a/r/tographers do not separate theory, practice, and making, preferring

to use all three ways of knowing in complementary or even contradictory ways.

Like arts-based educational research, a/r/tography is concerned with possibilities rather than probabilities. Therefore, understanding how to create the conditions for investigating or examining practices is essential. A/r/tography employs all forms of qualitative research data collection (interviews, observations, document collection, field diaries, etc.), yet it also involves the processes of artistic engagement (creating art forms in response or collaboration, or as evocation or provocation). Using data from a range of vantage points, knowledge is created in a never-ending state of becoming. Thus, a/r/tographers are committed to their living inquiry in and through time, regardless of the current research questions.

Theoretically, a/r/tography involves individuals working in a community of inquiry. Here, four commitments to a/r/tographic communities have been described. The commitments describe an a/r/tographic community of practice as a community of inquirers working as artists, researchers, and pedagogues committed to personal engagement within a community of belonging that troubles and addresses difference. Listing the commitments embedded in this statement, we see four commitments: (1) a commitment to a way of being in the world; (2) a commitment to inquiry; (3) a commitment to negotiating personal engagement within a community of belonging; and (4) a commitment to creating practices that trouble and address difference.

Relationality permeates our lives, and for a/r/tographers, this means that meaning is constituted between beings, and being is both unity and uniqueness, the singular plural of becoming. It is the betweenness that interests curriculum theorists the most. *Currere* thrives in the in-between. Moreover, a/r/tographers prefer to work from concepts rather than from methods. Concepts are flexible intersubjective locations of understanding, and methods are technically oriented pursuits. Both are needed, in research and pedagogy, but the emphasis is placed on conceptual renderings. A/r/tographers are concerned with conceptual renderings such as living inquiry, metaphors, and metonymy (and synecdoche), contiguity, openings, reverberations, and excess. These renderings assist a/r/tographers in understanding what they are seeing,

experiencing, and analyzing. Each of these renderings should be present in the processes and products created within a/r/tographic practices. A/r/tographers use relational forms of inquiry (conditions) and renderings (concepts) to conduct their practices.

A/r/tographers are necessarily skilled at their practices and continue to pursue refined understandings over time as they pursue “being” a/r/tographers in the world. Recently, scholars in a variety of areas have pursued a/r/tographical inquiry: for instance, architecture, health care, and the humanities. A/r/tography as a creative and educative form of inquiry is being transformed as interdisciplinary frames are employed to use its processes and structures. As more dancers, poets, musicians, actors, and multimedia artists engage with a/r/tography, other understandings will emerge to extend the richly visual understandings that have developed since its inception.

This entry has described the conditions and concepts used in the practice of a/r/tography. Moreover, four commitments were described that underpin the practices employed by a/r/tographers. For curricularists, these commitments coupled with the conditions and concepts of a/r/tography begin to describe how currere is developed in and through time with the help of the arts and focuses on learning. Currere is a living practice that lingers in the in-between of binary notions such as theory and practice. It is a negotiated space that dramatically broadens what it means to be a teacher and learner. And perhaps most importantly, currere as conceived through a/r/tography allows subjectivity to transform objectivity, and encourages a community of inquirers (learners) to become engaged in very deep, yet evocative or provocative ways.

## ARTS-BASED RESEARCH

---

Arts-based research is an approach to curriculum inquiry that looks to the arts instead of to the social sciences for its investigational and representational strategies and its epistemological premises. This form of inquiry has been used to explore a wide range of curriculum commonplaces, such as curriculum guides, textbooks, and other materials; elements of the hidden curriculum; the curriculum-in-use; and so forth. This entry focuses on the term’s origins: its growth in acceptance; forms of arts employed by arts-based researchers in curriculum studies; and the premises, purposes, and design elements associated with this form of curriculum evaluation and research.

### Origins and Growing Legitimacy

The term *arts-based research* was coined by Elliot Eisner of Stanford University in the 1990s. It has an antecedent in Eisner’s earlier notion of *educational criticism*, an approach in which the curriculum is researched and evaluated in a manner similar to that carried out by critics within various fields of the arts. The term was first publicized widely through a series of seven Winter Institutes of the American Educational Research Association co-directed by Elliot Eisner and Tom Barone of Arizona State University. Despite some skepticism and outright rejection by many traditionalist research methodologists, arts-based research gradually achieved visibility, credibility, and legitimacy as an acceptable qualitative inquiry approach in curriculum studies, within other fields of education, and in the humanities, social sciences, and various professional fields.

The approach has been linked primarily (although not exclusively) to curriculum studies as a result of the many presentations sponsored by Division B (Curriculum Studies) of the American Educational Research Association and has been featured prominently at meetings of other professional organizations devoted to the curriculum field, such as the annual conferences of the *Journal of Curriculum and Pedagogy* and the *Journal of Curriculum Theorizing*. Articles advocating and exemplifying arts-based research have appeared in numerous curriculum journals. Books and book chapters have also been devoted to the perceived attributes and detriments of the approach.

One measure of its development is the number of related research approaches it has spawned since the 1990s by scholars within and outside of the curriculum field. These include *arts-inspired research*, *arts practice as research*, and *alr/tography*. Most arts-based research employs literary formats, although many other forms are available in principle, and are sometimes used in practice. These include, among others, literary essays, poetry, short stories, novels, ethnodrama, music and musical improvisations, dance, photography, multimedia presentations and installations, painting, sculpture, performance arts, and so on.

### Epistemological Premises and Research Purposes

One of the most distinguishing features of arts-based research is the rationale for the research engagement. The point of doing this sort of research is not the traditional one of making knowledge claims or achieving validity and reliability, at least not in the usual sense of those terms. The purpose for doing arts-based research is not to move the reader or percipient toward the comforts of greater certainty. Instead, a student of curriculum would engage in arts-based research for the purpose of re-viewing curriculum phenomena that have come to be perceived or conceived of in a manner that is usual, conventional, or orthodox. This aim has also been expressed in other (related) ways, including offering the possibility of multiple meanings, of deepening and complicating the conversations about curriculum terms, issues, and phenomena. Ultimately, the reader or viewer may be brought to see dimensions of the curriculum in

a new, previously unavailable, light. These alternative perspectives and interpretations may not promote greater consensus, but instead produce disequilibrium, a disturbance that leads to further interrogation of meaning beyond what has come to be taken for granted within the field.

### Design Elements and Vicarious Experiences

This aim of extending the conversation about curriculum phenomena may be achieved within other forms of research as well. It is, however, a purpose that, advocates claim, is achieved in a unique way through the use of artistic design elements. Eisner and Barone have identified several of the design elements that are associated with research and inquiry based in the arts. These design elements may sometimes also be found, to some degree, infusing the inquiry and disclosure processes of other (more traditional) forms of qualitative inquiry, including case studies and phenomenological, narrative, and ethnographic approaches. However, to the degree that they permeate the inquiry process and product, the research may be identified as *arts-based*.

The most important of these elements is the presence of an aesthetic form within which the researcher embodies his or her observations. The design elements employed within the creation of this form will vary with the kind of art engaged in. Whichever art form is selected, an arts-based researcher does not aim to explain, or argue, the correct meaning of curriculum phenomena within the work. Instead, the work that is crafted will offer an invitation to the reader or percipient to enter into a virtual world that has been embodied within the work. Moving into this virtual world allows the percipient to engage vicariously in an experience that has both cognitive and emotional dimensions. In other words, the reader or viewer may come to understand curriculum phenomena from a fresh perspective, persuading him or her to reconsider the finality of seemingly commonsensical understandings. The quality of the work of arts-based research will therefore be judged on its potential for promoting that reconsideration through the vicarious experience it offers.

## ARTS EDUCATION CURRICULUM

---

The curriculum in arts education in K–12 schools may refer to the various arts—visual art, music, theater—or to the visual arts curriculum only; this entry addresses visual arts education. Though arts education is a long-standing part of the U.S. school curriculum, its rationale, structure, and content have changed substantially over the years. The arts education curriculum has evolved in response to changing conceptions of the purposes of schooling and of the role of creativity in human development, and it challenges traditional conceptions of assessment. At its best, art education produces citizens who can respond appropriately to their visual environment with skills that go beyond those readily measured.

### Visual Arts Media and Curriculum Structure

In the visual arts, the curriculum has generally covered art forms that are in traditional media, purely visual, and static in their finished forms. These include painting (in oil, watercolor, acrylic); drawing (in pencil, charcoal, oil pastels); other two-dimensional media producing original compositions such as murals, printmaking, collage, and photography (darkroom and digital formats);

ceramics (wheel-thrown and hand-formed); fibers and textiles; sculpture (subtractive carving as well as additive building in three-dimensional forms with armatures or assemblage); jewelry making. In recent decades, as the world of professional art has embraced new art forms, the art curriculum has begun catching up with these options; more complete art curricula offer experience in videography, large assemblages even occupying entire rooms as mixed-media “installations,” and improvisational performance art distinct from scripted theatrical productions.

The role of the arts in the public school curriculum varies by state, with most states leaving art instruction beyond a required introductory course as an elective. Nowhere is art education required in the extended sequence common to language arts or social studies; it has, however, enjoyed some strength in individual schools, districts, and states whose educational leaders have argued for the need for the arts in a well-rounded citizenry. Generally, secondary schools have at least one full-time art teacher each with a dedicated art room; students meet their art classes daily, for a full year, a semester, or shorter blocks such as 9-week sequences. Larger high schools may have specialized art teachers, each focusing on an art area such as two-dimensional, ceramics, or photography. Elementary school art-teacher assignments vary considerably with district resources. Just over half of elementary schools have an art specialist (one, more, or shared with other schools), teaching in a dedicated art classroom or working from a mobile cart. In elementary schools, student contact with art class is typically once a week; each art teacher may teach hundreds of children each week. For schools lacking an art specialist, art education falls to general classroom teachers with minimal, if any, preparation in art.

### Historical Background

The purposes of the school art curriculum have changed dramatically during the past century in the United States. Initially, art was part of a goal of schooling that prepared children for life in the work force, and much of what is now called visual arts education took the form of teaching precision drawing and draftsmanship, providing individual discipline and technical skills useful in commercial

areas or as a support to industrial growth. Early in the 20th century, especially with the rise of progressive education and an increasing focus on a child-centered curriculum, art came to be appreciated for its value in assisting in the complete development of children's capabilities, and an interest in "creative self-expression" as promoted by Viktor Lowenfeld helped argue for including the arts in the school curriculum. In this approach to the art curriculum, emphasis was placed on making art in the traditional art media, assessment of results was limited, and little was required of teachers to incorporate the history or philosophy of art systematically. The art curriculum lost in public favor with the school reforms that followed the USSR's launch of *Sputnik* in 1957, when increased emphasis was given to the "hard disciplines" of math, science, and reading, and the contributions of art to the national good seemed less clear than their contributions to individual growth had been. Nonetheless, committed art educators kept art in the schools, and starting in the 1960s, statewide efforts throughout the country succeeded in creating state arts councils, advocating for and supporting all the arts both in the school curriculum and in local communities. One of the strongest arguments for art education has, for a number of decades, been that at its best it teaches children to express themselves—and the ideas in their culture—in creative new ways that could not have been fully anticipated. The 1980s saw the introduction of the concept of "multiple intelligences" through Howard Gardner's work at Harvard University's Project Zero, giving new impetus to the argument that artistic ways of responding to the world are valid and worthy of attention in school.

### Assessment

The 1983 publication of *A Nation at Risk* again focused attention on the importance of education in math, science, reading, and in being able to assess student progress and compare U.S. schools' success with those in other countries. Assessment, increasingly important whenever national attention is directed to measuring school effectiveness, is a challenge to those who would assess the art curriculum consistently and reliably. Many educators have especially decried the 2002 No Child Left

Behind Act for its insistence on measurement and the damage this can do to the goals and practices of art education: Assessing the art curriculum is always more complex than in disciplines where unpredictable and surprise outcomes are less valued. Nonetheless, most art educators agree that clear standards in art education are critical both for ensuring the quality of teaching and for maintaining art's standing among the other disciplines: standards of quality, craftsmanship, and the communication of ideas can be applied even to student products that are new, creative, and surprising, and the best preservice teacher programs help art teachers develop appropriate assessment techniques. Advocates for art education seek assessment methods that reliably reflect the purposes of art education without requiring fully predictable products; portfolio assessment rather than achievement tests is one emerging approach.

### Current Trends

#### *Discipline-Based Art Education*

Art education in the United States took a major new direction in the 1980s with the tremendous success of the efforts of the Getty Center for Education in the Arts (as it was then called) and the scholars it pulled together to create a new direction called discipline-based art education (DBAE). The elements of DBAE were not new and had been successfully operating in many individual classrooms across the country for many decades, but they had not been combined into a coherent and organized approach to art teaching that could be taught to teachers and adopted districtwide. Getty funding provided for teacher training institutes; teacher-oriented publications including background books, curriculum guides, and full-color sets of posters with background and teaching suggestions on the back of each; and national conferences to clarify DBAE and make it accessible to teachers previously ill-equipped to teach in this way.

Before DBAE, and following on the heels of creative self-expression and progressive education's focus on developing children's "natural" abilities, art teaching emphasized the single discipline of art making. Art teachers had taught drawing, painting, sculpture, ceramics, and other art forms as art-making skills, and some did this extremely well,

producing admirable outcomes in student art projects. And before DBAE, art teachers received little systematic training in the content and practical uses of the other three “disciplines” of DBAE: art history, art criticism, and aesthetics. The resources of the Getty Center, and the scholars it attracted to its work on reformulating art education, gradually changed the direction of art teaching in K–12 schools to embrace this broader conception of “art.” Revising the “art curriculum” to go beyond art production was resisted by some who feared that time spent on art history, criticism, and aesthetics would detract from teaching the traditional skills of art making. Gradually, however, art teachers at all levels realized that the repertoire of visual resources provided by looking at the history of art, the discussion/analysis skills provided by working with guided art criticism, and the broader perspective on defining art through discussions of aesthetic questions—all combined to enrich students’ abilities to create interesting and meaningful visual images and objects. Teachers became comfortable with using these four disciplines, if not always in the structured, systematic, districtwide way that advocates for a full “DBAE curriculum” had initially proposed. Today, the K–12 visual arts curriculum still emphasizes art making, but art making is regularly enriched by the use of art history, criticism, and aesthetics incorporated by teachers whose own art education training in college has incorporated these perspectives. Emerging new national and state standards in art education tend to assume a discipline-based orientation.

### *Visual Culture Studies*

The art curriculum continues to evolve and change, and DBAE’s tacit success in broadening the art curriculum beyond art production to include art history, art criticism, and aesthetics, and especially its heightened emphasis on criticism and interpretation of visual images, laid the groundwork for a strong new approach to art education called visual culture studies. With the support of the large and influential National Art Education Association and the affiliated state-level organizations, contemporary art educators both in the classroom and in university teacher-training programs are finding ways to keep art instruction current and relevant to students’ lives while assessing

the effectiveness and impact of art instruction. Whereas DBAE added three new disciplines to the study of art, visual culture studies—referred to simply as “visual culture”—seeks to further broaden the definition of art education by admitting the broad array of images and design available in students’ everyday lives as legitimate content. The visual-culture approach to the art curriculum allows and encourages teachers to incorporate, critique, and reinterpret images of popular culture that exemplify compelling design and relevant content and styles. With visual culture as a focus, teachers of art can effectively introduce art making (and art history, criticism, and aesthetics) with images from comic books, magazine advertisements, television commercials, film, Japanese manga and anime, pop-up ads on Internet sites, Barbie dolls, commercial design on billboards and in downtown shop windows, CD covers, movie posters, and many other sources of visual composition available in everyday settings. When used appropriately, these popular-culture sources of imagery can be analyzed and understood both as compelling and meaningful compositions in their own right and by comparison to subtle or explicit art-historical precedents.

Art educators who advocate for teaching based on visual culture are divided about whether this approach is a distinct break from, or a continuing evolution of, the reforms reflected in the DBAE platform of the 1980s and 1990s; however, it is unlikely that it could have been as appealing as it is without teachers’ first feeling comfortable with art history, criticism, and aesthetics. Critics of the new call to visual-culture studies express concern that a curricular focus on popular culture will crowd out traditional “fine art” imagery (on which DBAE generally relied) and deprive students of contact with the great works of art from cultures worldwide. Most who advocate visual culture studies for art teachers and for K–12 students argue that traditional “fine art” is itself a subset of “visual culture,” the larger realm of visual experience to which art education properly should attend. The disciplines of art production, history, criticism, and aesthetics can be brought to bear on images from popular culture, but some visual-culture advocates argue that new methodologies and new aesthetic criteria are necessary for exploring this source appropriately. Visual culture studies is supported

by research by scholars from universities across the country, notably (at this writing) Pennsylvania State University, Ohio State University, Northern Illinois University, Indiana University, the University of Oregon, the University of Arizona, the University of Maine, George Mason University, and others, and by the classroom results by art teachers who have trained under them.

### *The Role of Art Museums*

Art museum education is distinct from the traditional K–12 arts curriculum, but bears mentioning as both a resource for K–12 teachers and an alternative career path for educators trained as art teachers. Almost every art museum in the United States has an education department, with professional art educators supervising and implementing a range of programs for both the general public and K–12 teachers and students. Art museum programs focus on the museum’s permanent collection and on temporary exhibitions, and are designed to be accessible to art novices, people with limited prior knowledge of art or art history. Museum program formats include thematic and highlights tours usually given by volunteer docents trained by the museum staff; teacher workshops designed to help teachers in many subject areas use the arts in their teaching; public lectures in the galleries and in lecture halls; family festivals; film series; conferences or symposia on selected topics; teacher resources such as slide kits and curriculum guides focusing on the collection; self-guiding tour brochures allowing visitors to move at their own pace; recorded audiotours, usually produced by professional production companies working with educators and curators; and many other resources. K–12 art teachers and their students are among the most regular attendees of many of these programs. Annual meetings of the American Association of Museums (AAM) include sessions on museum education, and the AAM’s Bookstore (available online) lists sources pertinent to using museum collections with visitors and K–12 students.

### **Concluding Comments**

Though the goals of art education have changed frequently in recent decades, the overall purpose remains constant: to teach children to see well, to

interpret their visual and cognitive environments clearly in visual terms, and to appreciate art that has done so. Art educators in schools and museums address the images and objects of the world’s cultures over time. The art curriculum teaches skills not covered in other subjects, skills that are vital to understanding and responding to the world. Though it can enrich the teaching of history, language arts, science, and other disciplines, its history in schools is a story of evolving rationales and approaches as a discipline of its own.

## **ARTS EDUCATION CURRICULUM, HISTORY OF**

---

The purposes and content of the school art curriculum in the United States have evolved in a kind of spiral since the institution of comprehensive public schooling in the late 19th century, varying the emphasis on art appreciation, art-making skills,

and art as a basic humanities discipline according to the prevailing reform movements of the time. Though arts educators argue for the value of art in its own right, art has never been a central core subject in the school curriculum; its importance and its integration with other subjects ebb and flow, and today art is taught in ways that allow it to be integrated with other subjects. That states now have a minimum arts requirement for high-school graduation testifies to the tenacity of the advocacy efforts of arts educators in recent decades.

Through the years, the art curriculum has been shaped by changing societal perspectives. It has evolved from emphasizing technical training and moral uplift to encouraging creative-self-expression, from teaching art as a multidisciplinary humanities discipline to helping connect students to their own visual lives. Its history is a history of our changing definitions of art and of learning. This entry discusses art curriculum from early industrialization to the present.

### The Visual Art Curriculum and Early Industrialization

In the late 19th century, romantic idealism led to the picture study movement and other efforts at providing exposure to works of high moral character: Art education served a kind of social reform purpose. Concomitantly, however, art was also taught as a practical skill, tied to the rise of industrial production; as the early-20th-century matchbook advertisements for “art school” suggest, much of what is now called visual arts education then consisted of lessons in draftsmanship and precision drawing, teaching individual discipline and technical workforce skills. Learning art meant learning to draw well.

The focus changed with the advent of progressive education before mid-century, emphasizing both child-centered education and Viktor Lowenfeld’s “creative self-expression.” This approach emphasized manipulation of art media and mastery of skills to enhance creative self-expression. Teachers taught painting, drawing, ceramics, printmaking, sculpture, and other art forms, all “art production” with little contextual study of the cultures that produced exemplars. The training of art teachers was inconsistent in its inclusion of art history and criticism techniques; assessment was limited.

### The Art Curriculum and Modern Crises

Modern history of art education has been a cycle of decline in times of national crisis and rescue by committed art educators and policy makers. Two events more than two decades apart—the USSR’s launch of *Sputnik* in 1957 and the publication of *A Nation at Risk* in 1983—separately changed professionals’ and the public’s attitudes toward art education. Both events threatened the resources of the art curriculum by shifting policy attention to science, math, and reading. But committed arts educators between these two events had kept the arts alive in schools and communities partly through the 1960s’ creation of state arts councils and the National Endowment for the Arts, raising the visibility of art in public life and—with the National Art Education Association—providing important support to art teaching. Coincidentally, at about the time *A Nation at Risk* was published, the introduction of the concept of “multiple intelligences” through Howard Gardner’s work at Harvard University’s Project Zero clarified the role that less-measurable ways of knowing can play in individual development. The resulting openness to creative disciplines is now challenged by the 2002 No Child Left Behind Act, difficult for disciplines that value unpredicted and surprise outcomes; its lasting impact on the art curriculum is still unclear.

### Recent Decades

The art curriculum notably changed after the mid-1980s with the development of discipline-based art education (DBAE), promoted through publications and teacher-training conferences by the Getty Center for Education in the Arts. DBAE redefined “art” beyond art making to include also art history, art criticism, and aesthetics. Initially resisted by traditional teachers ill-prepared to teach these disciplines, DBAE has gradually come to pervade the art curriculum nationwide, whether acknowledged by name or not. K–12 art classes regularly study artists, talk about images, and discuss what is art and what is not; research indicates that students’ creative art products reflect a broader understanding of art principles and world cultures than before DBAE.

Today, the art curriculum teaches art-making skills as well as art history, criticism, and discussion

of aesthetics issues, often using both fine-art exemplars and imagery from popular culture. Since the 1990s, some art educators have advocated visual culture studies, arguing that students should learn to critique and respond intelligently to visual design in everyday life. Comic books, live and animated film, advertisements, Barbie dolls, billboards and other imagery can introduce principles of composition, history, and cross-cultural connections between fine art and everyday life. Critics of visual culture studies, echoing the romantic idealist case for art appreciation, argue that visual culture studies detracts from students' contact with world civilizations' great works of art; advocates of visual culture argue that fine art is itself a subset of "visual culture" and that neither can be fully understood without the context of the Other.

Noteworthy also in recent decades is the increasing availability of high-quality programs on-site at art museums, in museum outreach programs, and through online Internet resources developed by museum educators. Traditional guided tours, image packets, teacher workshops, and family gallery programs are now complemented by a wealth of teaching resources on museums' Web sites, with images, information, lesson outlines, and materials for students doing research on art and its context.

## ARTS OF THE ECLECTIC

---

What constitutes an effective relationship between theory and practice is contested in education. Curricula based solely on either have proved ineffective in closing the gap between the curriculum guide and the learning moment. Joseph Schwab's unique solution to this problem is arts of the eclectic, whereby educational problems are examined through multiple perspectives instead of a solitary theory. He called this process *polyfocal conspectus*, which is needed because no single theory from the social sciences, for instance, can explain or define the curricular basis for effective teaching. The use of three or four theories in combination is key to the problem-posing stage of curriculum deliberation, in which the problematic situation is defined in various ways by each theory. The art of discerning the integrated approach that emerges from the various formulations of the situation develops educators' abilities to exploit a range of solutions rather than a simplistic answer.

The curriculumist uses arts of eclectic with commonplaces of education and arts of problemation. The commonplaces are common because of their interconnection; they are places whose reality cannot be sidestepped. These essential components of curriculum deliberation are learner, subject matter, teacher (social and cultural milieu), and curriculum making. They are established when scholarship in a subject or field is able to discern what things, concepts, or activities constitute the whole subject of which any one is a part. This is the source of the eclectic choices.

The fit of any given theory on a specific situation is inexact and incomplete, so the theory needs modification by other theories before it is effective. This radical move involves an art, the ability to see which of the possibilities is most likely to combine into an effective view that enables fruitful formulation of the problematic situation.

Schwab believes there are several kinds of eclectic arts. The first engages the incompleteness of each subject of the behavioral sciences. The second selects, adjusts, and combines the incomplete views. These join with practical arts concerned with the real details necessarily omitted by the generalizations of theory. Mutual accommodation develops between principle and case. This commingling of

the practical and eclectic arts requires collaboration among experts in the theories who must have deep concern to solve a pressing problem by crossing arbitrary boundaries of their specialties.

Schwab's use of intrapersonal commonplaces was based on extensive study of every theoretician from Plato to Erik Erikson. These involve such factors as reason, desire, social concerns, and the therapist. At Camp Ramah, after a review similar to Practical 2, Schwab asked the directors how the rational ego grows to be healthy and strong under the guidance of another. Freud barely considered this question because he was interested in intrapersonal mechanisms that could explain how the id, representing our desires, interacts with the super-ego, representing our inhibiting social conscience,

Freud posited the existence of an autonomous ego to manage these internal interactions but, unlike Plato's *Republic*, failed to tell us how such an ego can rationally develop. Schwab proposed that the counselors work to expand the young egos, not by therapeutic means, but by bringing energy and pleasure to the camping activities so the campers could develop both social competence and religious connection. This modification solved the problem by joining its practical with its theoretical aspects.

## ASCD (ASSOCIATION FOR SUPERVISION AND CURRICULUM DEVELOPMENT)

---

For almost a century, ASCD (the Association for Supervision and Curriculum Development) and its

two predecessor groups have fostered attention of many of the nation's educators to instructional improvement and the development of curriculum, initially in the United States, but more recently throughout the world. Rather than focus on particular school roles or positions (e.g., English teachers, supervisors of science, superintendents), ASCD has focused on functions common or similar to different roles and tasks in and across school divisions (e.g., elementary school, high school; differentiated instruction, reading). Deliberately, it always has welcomed to its membership all individuals—not only professional educators, but also people who do not hold professional credentials (e.g., school board members, parents) who are concerned with improvement of the school curriculum and teaching as well as those who participate in local improvement efforts. From the time it began operations, ASCD has continued to be an anomaly among professional organizations in U.S. education. To be sure, the contemporary ASCD differs in some remarkable ways from its beginnings in 1943 even as it maintains, at least in name, some of its early programs, purposes, and structures.

### Origins of the Organization

ASCD was the fruit of the merger of the National Education Association (NEA) Department of Supervisors and Directors of Instruction and of the Society of Curriculum Study. Both of these organizations began in the 1920s.

The supervision group, founded in 1921 as the National Conference on Educational Method, brought together school leaders who were particularly interested in the potential of William Heard Kilpatrick's "Project Method." Several years later as the Project Method waned in popularity, the organization recognized the value of highlighting various general teaching methodologies. In 1929, the conference became a department of the NEA with changed name. Its membership was never large, but most of its members were school supervisors. College and university faculty members as well as state level instructional supervisors constituted two other significant but smaller constituencies. Its major publication was *The Journal of Educational Method*, subsequently retitled *Educational Method*. In 1928, ASCD began the

publication of a series of well-regarded yearbooks. It held twice yearly meetings, at the meeting of the American Association of School Administrators (AASA) in the late winter/early spring and at the NEA annual meeting in the summer.

Especially important to this group was James F. Hosis, formerly a supervisor of English in the Chicago public schools and the founder of the National Council of Teachers of English. As a doctoral student at Teachers College, Columbia University, he came to believe that Kilpatrick's Project Method was one that was appropriate for use in almost every course offered at every school level. Hosis called what became the organizational meeting of the conference and, later, as a faculty member at Teachers College, he served as the group's executive secretary and editor of *Educational Method*.

The second party to the merger that created ASCD was the much smaller Society for the Study of Curriculum. This group's beginnings can be traced to a very small and informal discussion group convened by L. Thomas Hopkins, then a consultant to the highly publicized Denver Curriculum Program. The discussants were six school curriculum leaders who met at the 1924 AASA meeting and who agreed to invite a few colleagues and to meet again the following year during the AASA convention. This informal group slowly added members, and in 1929, it formally organized itself and, after two name changes, it took the name of Society for the Study of Curriculum. Like the Department of Supervisors and Curriculum Directors, the society met annually at the AASA winter/spring convention.

This slowly enlarging society attracted mainly school administrators and university professors actively involved in local school curriculum development projects. Its central purposes were to discuss features of practical, ongoing curriculum work in schools and to consider ideas and proposals for curriculum development. The society published *The Curriculum Journal* under the editorship of Henry Harap, who also served as the small group's executive secretary. The society also issued a short series of significant yearbooks. Probably its major project was its support and general sponsorship of the *Building America* series of pamphlets for use in secondary schools. Championed by Paul Hanna and initially supported by a General

Education Board grant, these instructional materials for secondary schools immediately attracted hostile editorial attention. Nevertheless, *Building America* survived the merger as an ASCD-related publication until 1948 at which time it became a casualty of the anti-Communist hysteria of the times.

Merger of the two groups was hotly contested. Led by California's Helen Heffernan, many supervisors were concerned that the new organization would marginalize both the function of supervision and women leaders. The initial merger proposal failed. On the second effort to merge in 1943, members of the two groups used a mail ballot and the merger proposal passed. Ruth Henderson, a Norfolk, Virginia, supervisor and the president of the supervisors group, became ASCD's first president. Nevertheless, Heffernan's concerns about the new organization became perceived reality even as ASCD's stature grew.

Notably, most members of the merged groups quickly become ASCD members. Although ASCD membership expanded in its first two decades, it grew quite slowly. Following a revision of its policies in the 1960s, ASCD initiated regular mass-marketing campaigns that yielded substantially increased rises in membership, mostly from school administrators, and grew steadily from some 10,000 members to more than 175,000 members.

### Purposes and Programs

The new ASCD continued to foster several of the previous groups' purposes and programs. Especially, for example, it stressed the importance of democracy in U.S. schooling, of the necessity to consider the uniqueness of individuals and their contexts in fashioning curricula and teaching practices in different classrooms and schools as well as the provision of attention to the potential of individual pupils, the importance to school faculties of shared governance, as well as cooperative planning and research in local curriculum development efforts and inservice education/staff development programs. Many of its early members also understood ASCD as a renewal of concern for principles and practices of progressivism in U.S. education. Additionally, many of these members welcomed the intellectual excitement of ASCD conferences.

As one effort to stress its concern for individual participation in a local curriculum enterprise, ASCD changed the name of its annual meeting from “convention” to “conference.” The conference structure, for many years, de-emphasized large “talk at” general sessions and substituted small discussion groups in a number of formats. Recent annual conferences, likely as a function of ASCD’s vastly increased membership, have adopted the typical convention format that mainly features large sessions and very few small group sessions. ASCD currently offers throughout the year a menu of small conferences and institutes.

With promotion of democracy as an explicit goal, ASCD early on sought to encourage democratic actions and study in schools. It also worked to create its own governance structure to reflect that commitment. For example, it convened a large board of directors at whose sessions policies could be debated and decided. To stress increased member involvement in the work of ASCD as well as to expand its program, association leaders also constituted a number of continuing and ad hoc committees, commissions, and task groups whose work yielded research studies, analyses of issues, and recommendations for both policy and decisions intended to enhance the organization’s program. A major organizational innovation was the creation of a review council that studied actions of the executive council and staff members. Recent years have witnessed steps away from such democratic involvement of members. Instead, fewer members are involved in governance than previously, and headquarters staff members, sometimes with consultation of a few members, develop plans for approval by senior staff and elected officers. The Review Council has been disestablished. This loss of attention to democratic decision making can be understood as a problem that accompanied ASCD’s massive membership growth.

### Publications

*Educational Leadership*, ASCD’s journal, has become one of the premier journals in the entire field of education. From its beginning, articles routinely have offered analyses and promoted both practical and speculative attention to concerns and issues of the field. Some of these matters have been

progressive in nature and often advocated attention in curriculum and teaching to important social concerns (e.g., intergroup/racial understanding), relationships of the nature of knowledge to curriculum content and teaching, and matters of personal individuality characterized by a long-running, popular column in *Educational Leadership*, “The Importance of People.”

Until recently, ASCD published annual yearbooks, some of which (e.g., Arthur Combs, *Perceiving, Behaving, Learning*, 1962) were reprinted several times. Across a number of years, ASCD’s publication efforts have expanded to include a number of popular video-based staff development programs as well as publication each year of several professional books on contemporary topics. As a means of emphasizing the value of research to curriculum, supervision, and leadership practices and policies, ASCD launched the *Journal of Curriculum and Supervision* in 1985 to publish scholarly, peer-reviewed research reports and essays that informed the field. After 20 volumes, ASCD abruptly ceased publication of this journal in 2005, at the time the world’s largest circulation scholarly journal in curriculum and supervision. Currently, ASCD cooperates with two universities to publish the online *Journal of Education Policy and Leadership*.

### The Nature of the Membership

What is noteworthy is that ASCD publicly and decisively undertook efforts during the 1960s and 1970s to reverse its tacitly discriminatory policies toward women and ethnic minority members. Although women constituted most of its members, few women had been elected to its top leadership positions. Membership of African American educational leaders in ASCD was very low until school desegregation in all parts of the nation achieved some success. ASCD leadership, prodded routinely by advocates, slowly recognized its inadequate positions on gender and race and implemented several initiatives that, in a very short period, increased participation and elected leadership of both women and non-White members of the Association. Indeed, ASCD was one of the first professional education groups to attend so self-consciously to such matters of inclusion and recognition.

### Recent Actions

ASCD recently has mounted an educational policy presence to influence congressional actions. Also, recent official action by the Association seems to have altered both its identity and purposes. With its new official name, ASCD, the organization begins to reflect a corporate rather than a professional education mission. The decision to omit both curriculum development and supervision from its name, mission, and governance appears to have severed its relationship with the historic curriculum field.

## ASIAN CURRICULUM STUDIES, CONTINENTAL OVERVIEW

---

In recent years, within the educational field, increasing attention has been given to Eastern/Asian traditions and Asian education including curriculum studies. The movement for school-based curriculum development (SBCD) in many Asian countries has called for the reconceptualization of SBCD concepts, restructuring of the context for SBCD, and reculturing the role of stakeholders in SBCD, which endorse the values of grassroots curriculum reforms, participatory decision making, knowledge construction, and student-oriented approaches to learning. These theoretical concerns have been partially addressed by Asian curriculum scholars.

### Research Published in English

In addition to books and book chapters, this review mainly covers research articles written in English from or about Asian countries published in the journals from 1990 to the present. These journals are *Curriculum and Teaching* (Australia), *Curriculum and Teaching Dialogue* (United States), *Curriculum Inquiry* (Canada), *Curriculum Journal* (United Kingdom), *Curriculum Perspectives* (Australia), *Journal of Curriculum and Supervision* (United States, now out of print), *Journal of Curriculum and Pedagogy* (United States), *Journal of Curriculum Theorizing* (United States), *Journal of Curriculum Studies* and *Transnational Curriculum Inquiry* (Australia), as well as two international Asia-based journals, *Asia-Pacific Education Review* and *Asia-Pacific Journal of Education*.

Interestingly, in terms of geographical origins, there were more articles from or related to Israel, Hong Kong (China after 1997), China, Singapore, and South Korea. There were some articles from or related to India, Russia (formerly USSR), and Japan. The publications related to Asian curriculum studies could be broadly categorized (individually or in combination) as follows: curriculum issues reflecting political, economic, social, and educational changes; reconceptualization of curriculum theories based on Asian/Chinese traditions; and employment of Western theories and frameworks for conducting curriculum inquiry.

### Israel

In the case of Israel, where multiculturalism is related to its political origins and sustained conflict, a number of published papers have been connected to broader social changes. Julia Resnik, for example, undertook a historical study of the curricula in Jewish schools and assessed how national ideology with regard to particularistic versus universalistic content had varied over time. Four national images were portrayed: “nation with a right to a state,” “nation by right of religion,” “a state for a persecuted nation,” and “a state for all its citizens.” Amos Hofman, Bracha Alpert, and Izhak Schnell have identified three stages of curriculum development: promotion of hegemonic national goals, emphasis on academic structure of knowledge, and multiple conflicting

goals. They call for a transcultural approach in which a core curriculum is offered to all groups and beyond which each group may display its uniqueness. On the other hand, Ruth Firer in 1998 analyzed the values and perspectives of human rights education in history textbooks, civic texts, and peace education manuals published from the 1950s onward, and Halleli Pinson recently examined the tensions between inclusion and exclusion in civic education. In addition, Majid Al-Haj, based on the content analysis of the new history textbooks in Jewish schools, explored the status of multicultural education in light of fluctuating conflict and peace in Israel–Palestinian relations, and Deborah Court, using John Dewey’s ideas on democracy and education, examined the role of education in helping build trust and enhancement of democracy at the level of individual interactions between citizens. Jonathan Cohen adopted Joseph Schwab’s practical and eclectic arts to derive educational implications from two rival theories by Harry Austryn Wolfson and Julius Guttmann in preparing for the discipline of Jewish philosophy for instruction at the high school level.

Apart from curriculum issues echoing historical and social changes, some articles are related to subject-specific or cross-curricular curriculum and teaching innovations as well as school reforms. Asher Shkedi has engaged in studies on curriculum development and teaching culturally valued texts and found that there was a lack of compatibility between the subject-matter and educational understandings of the curriculum writers and that teachers create their own approaches to teaching culturally valued texts. This may have implications for school-based workshops for curriculum adaptation, which may be desirable to relate the teachers’ thinking and deliberation to the curriculum development process and producing curriculum guides that match teachers’ narrative world of knowledge and thought.

### *Hong Kong*

For Hong Kong, there have been more empirical studies on curriculum studies compared with articles from or on other Asian countries. Among papers and books published, two areas of focus included curriculum-related policy issues and territorywide or cross-curricular curriculum reform.

The former is exemplified by Paul Morris’s analysis of the postwar Hong Kong secondary school curriculum. These studies reflect state control and are associated with a collection code with an emphasis on disciplinary and public knowledge but being opposite to the curriculum features that the government has advocated during the last two to three decades. The latter is illustrated by the target-oriented curriculum (TOC) initiative in the 1990s and other cross-curricular issues such as media education, civic education, and environmental education. In addition to the large-scale evaluation studies of TOC led by Morris, David Carless adopted a case study approach to illustrate how three primary school teachers of English as a second language interpreted Hong Kong’s cross-curricular TOC initiative. There were also papers related to specific curriculum change and school-based curriculum development. John Chi-kin Lee and his colleagues have published works on geography teachers’ lived experience of curriculum change, primary school teachers’ receptivity to environmental education, and humanities teachers’ perspectives of integrated curriculum development. Edmond Law and Maurice Galton have published an article on how teachers’ participation in curriculum decision making in a school-based curriculum project in Hong Kong could enhance their professional growth. Yiu-chun Lo’s work on micropolitics of curriculum leadership of three primary schools found that curriculum leaders’ interpersonal skill is a critical factor promoting school-based curriculum development.

Teachers’ and students’ conceptions of subjects and teaching and learning have been an area of attention. These were shown in Bick-har Lam’s study focusing on conceptions of teaching art held by secondary school teachers and the study by Chi-chung Lam, Ngai-ying Wong, and Patrick Wong of students’ conceptions of mathematics learning. Although most of these studies were qualitative, Derek Cheung and Hin-wah Wong have developed a quantitative curriculum orientation inventory to measure teachers’ curriculum orientations.

Teaching and learning was another area of interest. Ming-tak Hue’s work explored the influences of Chinese culture on teacher-student interaction in the classrooms of Hong Kong secondary schools. Kam-wing Chan’s study highlighted constraining

factors affecting the use of cooperative learning in primary schools. Louisa Yan, however, investigated the contextual influences on the formation and behavior of out-of-class study groups through case studies.

Publications related to school–university partnership projects were also quite prominent. Amy B. M. Tsui and her colleagues have published a number of studies on tripartite supervisory conferencing processes (among the supervisor, the cooperating or mentor teacher, and the student-teacher) and teacher learning. A team of researchers led by Munling Lo also used Ference Marton’s theory of variation through a number of learning study projects to help teachers plan lessons for better teaching and learning. At the Chinese University of Hong Kong, a number of large-scale school improvement projects were launched, and many Chinese and English publications related to the improvement of curriculum, teaching, and learning were generated.

### *China*

Hua Zhang and Qiquan Zhong remarked that Chinese curriculum research was bound up with political ideology, especially during the 1950s and the 1960s. There had been emphasis on the study of curriculum history and Chinese curriculum theory depended heavily on curriculum practice. They also recognized three kinds of curriculum wisdom in China—namely Confucian, Taoist, and Buddhist. Confucian curriculum wisdom, for example, highlights the sociology of mean-harmony. Taoist curriculum wisdom based on the teleology of nature has implications for the deconstruction of curriculum discourses. By contrast, Buddhist curriculum wisdom provides possibilities for revitalizing the curriculum through an emphasis on spirituality. Apart from traditional wisdom, Yuzhen Xu has examined the images of school teachers, students, and other related education constituencies as shown in China’s popular movies and television series. However, there have been studies of curriculum and instruction on specific themes or subject areas. Jeffrey Fouts and Jack C. K. Chan analyzed the historical development of Chinese social studies education in the contexts of both traditional China, with a pervasive influence of Confucian values, and modern China under Mao and the Communists. In addition to work on

curriculum theorizing, there were studies using narrative inquiry under the influence of Michael Connelly. Ming Fang He, for example, undertook narrative inquiry of three Chinese women teachers with regard to their cross-cultural movements in China and the United States. Conversely, there was a study by Hui-lin Hung on learning experiences of Asian international students in U.S. higher education from cognitive and sociocultural perspectives.

### *Taiwan*

For Taiwan, there were only a small number of curriculum studies in English. By contrast, a review of the literature from 1994 to 2003 by Shin-Jiann Gau and Yu-works Chien Hsu revealed that there were 492 funded projects by the National Science Council, 243 academic books, 417 peer-reviewed journal articles, and 817 master’s and PhD dissertations and theses on curriculum studies published or completed. Some trends were identified, such as the primary sector and the interface between primary and secondary schooling tended to receive more scholarly attention compared with preschool and senior secondary education. In key learning areas, science and technology education tended to be the areas for most research outputs. In addition, more works were published related to curriculum implementation, curriculum development, and curriculum design, but less attention was paid to curriculum decision making and the hidden curriculum. Moreover, perceptual, operational, and experiential levels of curriculum, as suggested by John Goodlad, had fewer publications than those targeted at ideal and formal curriculum levels. Notably, many reputable postmodern and critical curriculum theorists in Taiwan had actively engaged in curriculum reform, and future studies could explore the impact of their endeavors on Taiwan’s curriculum change.

### *Singapore*

In this century, Singapore, which has experienced substantial economic and infrastructural changes, has witnessed a series of curriculum and school reforms, captured in the slogan, “Thinking schools, Learning nation.” Against this backdrop, Charlene Tan discussed the curriculum challenges in creating thinking schools, and Aaron Koh has

pointed out the limitations of critical thinking as a strategy to nurture students to be creative and critical thinkers. It has been suggested that given that pragmatic and instrumental functions of the educational policies were fulfilled, there could be spaces for the introduction of critical literacy. Apart from teaching thinking, other publications reflected varying curriculum and instruction agendas, such as multiculturalism, citizenship education, and national identity, many of which appeared in *Asia-Pacific Journal of Education*. In addition, Jason Tan examined the short-lived development in introducing religious knowledge in Singapore, and one of the issues was treating curriculum as a contextualized social process instead of a technocratic plan. There were studies on the global-local dynamics of curriculum policy development in the Chinese high school by Lesley Vidovich and Tom O'Donoghue.

### Japan

For Japan, the articles tended to be comparative education oriented. Edward R. Beauchamp, for example, analyzed the educational reform in post-war Japan under U.S. direction, and Hua Yang compared the role of the middle school teacher in Japan and the United States. Gundel Schumer, conversely, examined mathematics education organized privately outside the school, which involved homework, voluntary studies at home, and private supplementary lessons. The findings revealed that parents and supplementary schools contributed substantially to the learning process of Japanese students.

### South Korea

For South Korea, many curriculum- and teaching-related papers could be found in *Asia Pacific Education Review*. There were, however, a few articles focused on the reconceptualization of curriculum and instruction. Young Chun Kim, for example, endorsed the theme of curriculum as a postcolonial text as a feature of Korean curriculum studies. He also called for demystifying the validities of U.S. curriculum theories and gaining insights from both Korean and Asian knowledge such as Taoism and Buddhism to create new curriculum languages. Seungbin Roh suggested the imperatives

of intercultural equality, bilingual instruction, integration of culture and language, and multicultural perspectives for reforming English as a foreign language (EFL) education in Korea.

### India and Other Neglected Regions

Despite India being a massive Asian country with strong traditions of Buddhism and Hinduism, and a complicated historical heritage associated with colonialism, partition, and postcolonial independence, there have been only a small number of publications published in international curriculum journals. These include the following examples: a review of primary education by Tapan R. Mohanty; a review by Sandhya Paranjpe of using behavioral objectives and differentiation as a means to cater to children with special needs; and using the pedagogy of extensive reading in an ESL course at the tertiary level by Rachel Lalitha Eapen. For the Philippines, the journal *Asia-Pacific Educational Researcher* has published some articles related to curriculum studies. Russia as a vast country and the Middle East with its dominant Muslim, though multifaceted, culture are also neglected regions in the English-language curriculum literature.

### Research Published in Chinese

Apart from English publications, it is notable that in the Chinese communities of the Chinese mainland, Taiwan, and Hong Kong, there were many books and articles in Chinese related to curriculum studies. In China, the People's Education Press under the Ministry of Education published *Curriculum, Teaching Materials and Method* in 1981. In Taiwan, the Association for Curriculum and Instruction published the *Curriculum and Instruction Quarterly* and another *Journal of Curriculum Studies* was launched in 2005. In Japan, the *Japan Society for Curriculum Studies* appeared in 1989.

### The Future

This review illustrates the diversity of the landscape of curriculum studies in selected Asian countries or regions. Many of the Asian developing countries, because of political, socioeconomic, cultural (including linguistic), and other reasons, are weakly

represented in both the English-language and other Western academic publications focused on curriculum inquiry. More work could be done through international collaboration or partnership to help consolidate their curriculum research endeavors and participate in the formulation of international, Asian, or indigenous curriculum discourses. As Claudia Eppert and Hongyu Wang remark, there are potentials for the Asian traditions such as Buddhism, Confucianism, Hinduism, Taoism, and other invisible traditions to offer insights for specific curriculum scholarship such as critical pedagogy, environmental education, holistic education, character education, literature, and arts education as well as women's and gender studies.

## AT-RISK STUDENTS

---

However one analyzes the frustration, behaviors, and attitudes of troubled youth and their often seemingly “aimless existence,” one fact is becoming increasingly clear. In a society undergoing a revolution in its folkways, norms, and values, its youth (quite possibly all of them to some degree) are at risk. The popular definition of students who are at risk is, by default, those students who are affected most by the risk factors. Those risk factors are low achievement, retention in grade, behavior problems, poor attendance, low socioeconomic status, and attendance at schools with large numbers of poor students. All of these factors are closely related to dropping out of school, which, as it turns out, is what the at-risk label is identifying.

Extrapolating selected perceptions from the entire spectrum of human behavior, one notices the fragility as well as the breakdown of traditional family life and ultimately its effect on the school's curriculum. Also, given the rise in numbers of structurally dysfunctional families, a rising divorce rate, the prominence of single-parent households, and childhoods victimized by violence, sexual abuse, and incest, one can readily witness major impacts on a child's social and emotional development. The school's curricular response has often been past the fact and somewhat limited in perspective. These kinds of events all affect our youth's behaviors. They can twist, shape, or disorient psychological and social functioning and the multiple relationships each of us has from childhood through young adulthood. These behaviors are often the essence of at-riskness. These factors all contribute to the ever-changing needs of these students and their well-being.

Important research has found that by the time students are in the third grade, one can fairly reliably predict which students will ultimately drop out and those who will complete their schooling. These risk factors are usually stress related and ultimately affect the identification and predictability of dropouts with actual performance as the most reliable predictor.

With these ideas concerning being at risk in mind, it becomes much easier to picture the “classic dropout.” That individual will likely be a member

of a racial, ethnic, or language minority group and from a family where education is not a high priority; the individual will have academic difficulties, including the possibility of being behind in grade level; the individual will be bored or frustrated with school. The process of dropping out will often include a growing number of tardies and absences, disruptive classroom behavior, and a decline in academic performance. The classic dropout simply stops coming to school one day.

One common factor brought to light is that schools and school systems that are effective in reducing the numbers of dropouts do not permit this classic scenario to reach fruition. Through early identification, the high-risk student is not permitted to become just another statistic. Absences or behavior problems are not merely observed; action is taken to understand the causes and to prevent unnecessary repetitions. Students should not be allowed to “disappear,” but when the decision to leave school is not reversible, the school should point the dropout to alternative programs and options for keeping the door to an education open. The student, in general, needs to know that some individual cares, and that the school cares.

A number of possible program formats offer simple but effective techniques for organizing and managing diverse school and community resources to develop and conduct programs for at-risk youth. Numerous studies show that school programs alone are not well equipped to address those non-school causes that place children at risk of school and life failure. It is, therefore, imperative that school boards network with multiple resources (school, community, family, business, and industry) that can serve the needs of at-risk children both in school and outside of school.

## AUDIT CULTURE

---

*Audit culture*, in general, refers to the implementation across a wide range of businesses and institutions of systems of regulation, in which questions of quality are subsumed by logics of management. The term began to be employed in the 1990s by British accountants, anthropologists, and sociologists to refer to the increasing use of regulatory mechanisms, designed to monitor and measure performance, in fields other than accounting, insurance, and finance, where the mechanisms originated. More recently, the term has been used to refer to and theorize the emergence within the human services of these regulatory practices and the language and values accompanying them. For example, terms such as *performance outcomes*, *quality assurance*, *accountability*, *transparency*, *efficiency*, *best practices*, *stakeholder*, *benchmarking*, and *value added* circulate within and anchor the discourses that constitute audit culture. The values that shape audit culture are primarily those of objectivity, efficiency, and productivity. These values inform and are sustained by setting measurable performance outcomes; generating quantitative data to evaluate and inform programs, policies, and interventions; and monitoring and rewarding progress in achieving numerical goals.

Within curriculum studies, the concept of audit culture is used to refer to the adoption by educators of what are often referred to as the practices and discourses of standards and accountability and to the consequences of that adoption. The concept has proved helpful in understanding the transformation that has occurred in education during the last decade, when, at all levels of schooling, audit has emerged as the preferred way to hold schools accountable and to determine whether federal, state, and local spending on education produces benefits. In the United States, examples of audit culture include No Child Left Behind's emphasis on quantitatively measuring learning by using high-stakes testing; the National Council for Accreditation of Teacher Education's insistence on performance standards, numerical data, and the deployment of data aggregation systems; state and local movements to tie teacher pay to test scores; and colleges' benchmarking student writing and measuring value added through standardized tests.

The spread in Europe of the Bologna Process, which seeks to standardize curriculum and diploma requirements, and the implementation at all levels and throughout most of the developed countries of procedures that standardize teaching and the curriculum, quantify student learning, and hold teachers and administrators responsible for numerical results further exemplify the practices constituting audit culture.

Curriculum theorists have been critical of audit culture overall, but have focused particularly on two aspects of audit culture. The first concerns the way audit culture renders schools, teachers, and the curriculum auditable. The second concerns the relationships between audit culture and neoliberal economic interests.

### **Rendering Schools, Teachers, and Curriculum Auditable**

The curriculum, teachers, and schools become auditable through implementation of a system that defines, measures, and monitors performance, and can monitor the regulatory system itself. The first step in rendering teachers, the curriculum, and the school auditable is to establish standards, which determine how problems are phrased and prioritized and what constitutes the single best way to address such problems. Some curriculum theorists argue that because standards, in the name of neutrality and equality, treat diverse groups, individuals, communities, and histories as commensurable, the standards diminish or mask inequities in resources, power, access, and treatment. Because disparities exist among individuals and groups, the standards, which do not recognize these disparities, ultimately result in a hierarchy of differences that are then cast as the fault of the schools, the students, their families, or the teachers.

The second step in making teachers, the curriculum, and schools auditable is to convert standards into measurable performance outcomes, which can be translated into numerical data. Thus, several curriculum theorists argue, audit naturally results in the widespread use of tests, the transformation of the curriculum into bits of information, the retention of which can be measured by tests, and a narrow focus on behavioral measures that can easily be quantified. Furthermore, because

performance standards define specific demonstrable behaviors, for example, performance on a test, doing group work in class, or putting an aim up on the board, and because the level of success in demonstrating these behaviors must be assessed by standardized measures, activities such as teaching are broken down into finer and finer units. Thus, the operationalizing of standards divides teaching and the curriculum into component parts, which, some curricularists have argued, strips teachers of autonomy and the curriculum of intellectual substance.

The last step in rendering teachers, the curriculum, and schools auditable involves quantification. Quantification emerges as the way to further make commensurable diverse phenomena. In reducing everyone and everything to quantifiable data, ranging from test scores and attendance records to performance on behavioral check sheets, all historical, personal, idiosyncratic, and context-specific details about the person or event are erased. These data, produced in relation to standards, in turn demarcate the domain for academic interventions. But these interventions, many curriculum theorists argue, are not sensitive to the specificity of context or history, or to the unique experience of the subject/object of intervention.

### **Audit Culture's Links to Neoliberal Economic Interests**

Another aspect of audit culture that has come under increasing scrutiny within curriculum studies concerns its relationship to neoliberalism or free market capitalism, which can loosely be defined as the belief that the free market offers the best way to regulate all aspects of social life. According to some curriculum theorists, since the early 1980s, as public education has been transformed into a multibillion dollar market, audit culture has both advanced that transformation and been spread by it.

It has facilitated the transformation by reducing the enormously complicated work of teaching and curriculum development to standardized practices, by equating education with quantifiable outcomes on standardized exams, and by tying teacher pay and school funding to bottom-line success. If all that matters are the end results, for example exam results, and if particular practices and particular curricula purport to produce good results, then a

market is created to package and sell those practices and curricula, as well as those tests. Public education, itself, as well as the value of an education and the art of classroom teaching, recede in importance as the measurable bottom line of exam results takes precedence.

In addition to advancing the marketing of education, audit culture has also been spread by it, in two ways. First, some educators, worried about accusations of incompetence and the takeover of schools and teacher education by for-profit corporations and city and state governmental agencies, have embraced the practices, language, and values of audit culture to ensure professional status and autonomy. The assumption is that if education had the same established standards, protocols, practices, and systems of accountability that, say, medicine, law, and engineering have, then teachers and educators would be treated with the same professional respect as physicians, attorneys, and engineers. Such professional status would shore up autonomy and stave off privatization and governmental intrusion. Some curriculum theorists argue, however, that the embrace of audit culture has had the paradoxical effect of rendering teachers and the curriculum more vulnerable to for-profit corporate interests, governmental intrusion, and charges of ineptitude. A focus on quantifiable results, rather than a teacher's expertise and the value of education for its own sake, allows those who are not professional educators to claim they can achieve the same results more cheaply and efficiently. Furthermore, the inherent variability and contingency of such results, for which teachers are held responsible, exposes teachers to constant charges of incompetence.

Second, some educators embrace audit culture in response to the demand that funding for education be tied to bottom-line results. Educators and teachers are asked to prove that what they are teaching has an impact, a "bang for the buck." Because audit culture promotes standardized and quantifiable outcomes, comparisons can be made that educators hope will prove that, for example, accredited teacher education programs achieve better results than alternative certification programs or that a body of pedagogical knowledge learned formally over time exists that produces results. The problem, according to several curriculum theorists, is, again, that the intangible value of

education has been reduced to a cost-benefit analysis.

Audit culture offers an important heuristic for curriculum theorists who want to understand the transformation in education that has progressed during the last decade under the twin banners of standards and accountability and the effects of this transformation.

## AUTOBIOGRAPHICAL THEORY

---

Before the 1970s, virtually no autobiographical scholarship existed in the field of curriculum studies. In the realms of literature and literary criticism, classical Western autobiographies for a number of years had focused on public figures and were, for the most part, written by men. Works that did theorize autobiography primarily treated men's life writing. Until the mid-1970s, little work was done in literary studies, especially, on theorizing women's autobiographies other than through formalist categories, such as history and genre. And those theories most often were grounded in liberal feminists' notions of essentialist, universal, singular, and unitary conceptions of "woman," "gender," and "voice."

However, by mid-20th century, autobiography as both literary genre and curriculum discourse in U.S. curriculum studies paired well

with existential-phenomenological theories, partly because autobiography was fertile ground for considering ways to reconceptualize curriculum conceptions and studies from a focus on “external,” behaviorally oriented learning objectives and predetermined subject-matter content to investigations of students’ and teachers’ “inner” experiences and perceptions of their lived curriculum.

Since the late 1980s, autobiographical theories have been and continue to be influenced especially by feminist poststructuralist, transnational, postcolonial, and queer theories, to name a few anti-foundational perspectives and philosophies. These theories enabled curriculum theorists and researchers, from various epistemological and ontological positionings and agendas, to consider divides between fact and fiction as well as the impossibilities of autobiography as a “self-expressive” act; to challenge possibilities of presenting a life “objectively”; and to examine how shaping forces of language prohibited any simple attempts at “truth,” reference, or accurate and unmediated representations of “self” and “others.”

### Autobiographical Theory and Method as Groundbreaking Inquiry in Curriculum Studies

In the mid-1970s, William F. Pinar and Madeleine R. Grumet introduced autobiographical inquiry as a form of curriculum theorizing and research into the U.S. curriculum studies field. They did so by denoting the Latin root of curriculum, *currere*, meaning to run the course, or the running of the course, thus interrupting the dominant technical-rational focus of the field that conceptualized curriculum as a noun—as in “the racecourse” itself, the “content,” the “syllabus,” the “lesson plan.” Influenced by existential phenomenological philosophy as well as by literature, the arts, and psychology, Pinar and Grumet elaborated the method of *currere* so that students and teachers could study relations among school knowledge, life history, and subjective meaningfulness in ways that potentially could function self-transformatively.

Autobiography as both method and a form of curriculum theorizing certainly was regarded as not normal or typical in the 1970s. Uses of

autobiographical theory and practices dramatically changed the nature of curriculum theorizing in that it directly challenged mechanistic, efficient, and technologized as well as political constructions of curriculum and theory that ignored, minimized, or cast in abstractions individuals’ lived experience of schools.

The autobiographical method of *currere* thus provided impetus as well as theoretical groundings for the reconceiving of a managerially oriented U.S. curriculum field, spawned in the 1920s by demands for efficiency, prescription, and standardization, into a field filled with multiple and differing descriptions and interpretations of conflicting, changing, and divergent human needs, desires, and hopes.

*Currere*, as initially conceptualized by Pinar, included four stages of autobiographical reflection: the regressive, the progressive, the analytic, and the syncretic. This method provided an accessible and yet fully theorized means of analyzing “the nature of educational experience.” As a method of curriculum inquiry, it insisted on inserting descriptions and analyses of teachers’ and students’ gendered, raced, classed lives and psycho-social/cultural contexts into what heretofore was a faceless, mechanical, and supposedly neutral processes of “designing,” “developing,” and “mastering” the curriculum conceived only as “content to be covered.”

Further, both Pinar and Grumet, in elaborating Pinar’s method of *currere*, drew attention to the necessity of rendering multiple accounts of selves and school knowledge and experiences to cultivate individuals’ capacities to see through the outer forms, the habitual explanation of things. Those multiple accounts fractured the dogmatism of a singular telling and called attention to social and political aspects of autobiographical analysis and interpretation.

According to Pinar, three streams of scholarship followed, the first of which included *currere* as an inquiry method, uses of dialogue journals, autobiographical analyses of place, and myth and imagination. The second stream was feminist autobiography. The third included efforts to understand teachers’ experiences biographically and autobiographically, among them teacher lore; the personal practical knowledge of teachers; collaborative autobiography and biography; biographical

studies of teachers' lives; and interviews autobiographically focused but termed "personal biographies."

Autobiographical curriculum theory more currently has dispersed, for example, into cross-cultural theory, psychoanalytic theory, and women's studies, as well as into studies of innovative pedagogical practices, life-history theory and methods, and ecological theory.

### Phenomenological and Psychoanalytic Feminist Autobiographical Theorizing

Women's autobiographical practices, as both an expression of women's life experiences and a source for developing feminist theories, were acknowledged as constituting a field of study around 1980. Significant early feminist literary critics focused on the overlappings of women's lives and their writing in studies that attempted to map a women's tradition and to legitimate feminist scholarship.

Concurrently, during the 1970s and 1980s in U.S. curriculum studies, some feminist theorists explored uses of hermeneutical and existential phenomenology as philosophical frameworks, and others used particular aspects of psychoanalytic theory for describing, in relation to education writ large, structures of "experience" and subjectivity as they present themselves to consciousness. Grumet, for example, in her analyses of the "feminization" of teaching, used the ego psychologist Nancy Chodorow's postulation that the feminine personality comes to define itself in relation and in connection to other people more than does a masculine personality. Grumet worked with the psychoanalytic implications of Chodorow's findings that women are less individuated than men and thus have more flexible ego boundaries to argue for "relationality" as one way to theorize women's subjectivity in autobiographical curriculum inquiries and as one way to understand teaching as a feminized and thus generally devalued profession.

The tracings of existential phenomenological contributions to the development of *currere* as an autobiographical method of inquiry compelled some curricular feminists to focus particularly on their work and experiences as women teachers, attempting to suspend their presuppositions about

their perceived fragmented "teacher selves" to enter into a female academic life-world and to study the specific phenomenon of the gendered nature of their teaching.

Some feminists struggled particularly to "bracket" their teaching experiences, to engage in Edmund Husserl's phenomenological reduction so as to describe the intentionality of their teaching and theorizing practices. Others aligned with Martin Heidegger's emphasis on making manifest what is hidden in ordinary, everyday experience and with Maurice Merleau-Ponty's denial of the possibility of "bracketing" existence. These versions of phenomenology encouraged some feminist curriculum theorists to focus on methods of interpretation to support calls for studies in curriculum that examined the "self" in relation to social, cultural, and political contexts—in relation, for example, to the "hidden curriculum" of ordinary, everyday gendered educational experience.

### (Mis)Appropriations of *Currere* as Autobiographical Method

Ironically, since the mid-1980s, the initial theorizings of autobiographical curriculum research prompted such an embracing of autobiography and the method of *currere* as a "way of knowing" in education, writ large, that a variety of un-theorized appropriations appeared in the educational arenas of teacher education, especially.

For example, many of the still currently circulating uses of autobiography in teacher education and research often work toward definitive and conclusive portraits of "developed," "reflective," and thus "effective" teachers, students, and teacher-researchers. Normalized conventions of positivist educational inquiry and practice also are reinforced when autobiography is used as means of arriving at solutions and answers to pedagogical and curricular issues and problems, and when the arrival at a solution through an autobiography is somehow seen as proof or evidence of some fully examined, accessible, and thus "accountable" teacher or student "self."

Further, many current uses of autobiography in teacher education and research assume a developmental "end" product as well as possibilities of "best practice" in constructions of teacher selves, curriculum materials, and pedagogical approaches.

Un-theorized conventions of using autobiography in teacher education also assume the possibility of a relatively quick (e.g., in a one-semester-long “methods” course for preservice teachers) and conclusive self-reflective examination that can illuminate “flaws” or “problems” that then can be “corrected” in the student’s educational philosophy or her pedagogical approach or her conceptions and constructions of curriculum.

Further, admonitions in teacher education to just “tell your story” as a form of autobiographical curriculum theory and practice often lead to versions of teacher-research in which teachers learn about and then implement new pedagogical approaches and curriculum materials without a hitch. Ironically, such (mis)appropriations of autobiographical method as *currere* often lead to autobiographical accounts of how teachers were “mistaken” or “uninformed” or “ill-prepared” but now have become fully knowledgeable and enlightened about themselves, their students, and their teaching practices. Such distorted versions of autobiographical curriculum theory thus maintain a dominant educational narrative in which one passes, in linear and sequential ways, from ignorance to knowledge about both the “self” and other.

However, such constructions and uses of autobiography in teacher education that promise self-reflection and self-understanding as unmediated by language, culture, constructions of sexualities, or the unconscious, for example, simply maintain and even reify current emphases in education that insist on producing predictable, stable, and normative identities and curricula that can be measured, compared, and compartmentalized into hierarchical “achievement” categories.

Further, such “identity-constituting” discourses of teacher education and many of its current uses of autobiographical practices, for example, maintain the status quo and reinscribe already-known situations and identities as fixed, immutable, locked into normalized conceptions of what and who are possible. Such (mis)appropriations of autobiographical curriculum theories ignore ways in which such theories sought to explore autobiography’s social and political potential to examine “selves” and curricula as sites for what Judith Butler calls for in conceptualizing any identity, or, for that matter, any curricular categorization: permanent openness and re-signifiability.

### Multiple, Fluid, Contingent, Situated Autobiographical Theories

Current versions of autobiographical curriculum inquiry, because they have been inflected with feminist poststructuralist, postcolonial, indigenous, critical race, and queer theories, for example, that began circulating in the late 1980s and eventually into contemporary iterations, focus on questions of how the subject might know herself “differently.” Strategically producing a difference out of what was once familiar or the same about what it means to “be” a teacher or student or researcher or woman, for example, cannot happen by “telling my story” if that story repeats or reinscribes already normalized identity categories. However, uses of autobiographical inquiry, from these various anti-foundational perspectives, can cast in new terms ways in which educators might investigate multiple, intersecting, unpredictable, and unassemblable identities.

Feminist poststructuralist versions of autobiographical theorizing, for example, often focus on the constitutive aspects of autobiographical subjectivity, which include memory, embodiment, identity, experience, and agency. Such aspects increase determined subjectivities as never unitary and complete, as never able to simply escape the mediations of discourse, and as always located in particular times and places. Subjects may occupy multiple, differing, and often-shifting positions in terms of gender, race, ethnicity, and sexuality, for example, that no autobiographical method or practice could easily sever, separate out, or subsume under one another.

Instead, by examining disjunctures, ruptures, breakups, and fractures in normative, modernist versions of the unified life-subject and her own and others’ educational practices, these anti-foundational forms of autobiographical theory and practice can function, for example, to “queer” or to make theory, practice, and the self unfamiliar. To “queer” is to denaturalize conceptions of one singular, whole, and “acceptable” curriculum theorist, researcher, or student “self” as well as versions of autobiographical inquiry that rely on such conceptions.

The political leverages of conceiving of and enacting autobiographical theories as such reside in situated, local, contingent, and thus powerful

challenges to traditional forms of educational research that normalize the drive to sum up one's self, one's "curriculum" as content, one's learning, and "the other" as directly, developmentally, and inclusively knowable, identifiable, and even measurable. For example, many current anti-foundational forms of autobiographical theorizing and research suggests a focus on a range of sexualities as well as racialized and classed identities that exceed singular and essential constructions of "student" and "teacher." Poststructuralist, postcolonial, transnational, or "queered" autobiographical theories, although differently framed epistemologically and ontologically, also might compel curriculum studies scholars and practitioners to consider aspects of being implicated in desires for and performances of, as well as in fears and revulsions toward, those identities and practices that exceed the "norm."

To use autobiographical forms of inquiry that incorporate aspects of poststructuralist, postcolonial, queer, or transnational feminists theories, for example, is potentially to produce stories of self and other that can't be easily identified with or contained within one linear and transparent rendering or reading.

Thus, feminist poststructuralists, for example, offer challenges to writing autobiographically without essentializing selves through the very categories one has received as "naturally" constructed or as the only ones available to talk about those selves. Such autobiographical theories encourage curriculum scholars and practitioners to research identities and research processes that have been produced and reiterated, for example, through gendered, raced, classed, sexualized cultural norms taken to be fixed and permanent and thus regulatory, rather than provisional and unstable and thus able to be changed. These theories also point to the necessity of tracking how power circulates, of theorizing how subjects spring from the discourses that incite them, and of challenging unproblematized representations of "self" and "other," even as one might need to engage in representation as one way to intervene critically in the constitutive constraints of discourses.

When embodied, contingent representations of self are analyzed in terms of discourses available with which to constitute any one version of subject

or subjectivity, as well as juxtaposed with now-transnational swift flows and mobilities of mediated images, or mass migrations, or commodities, cultures, and capital, there results a new order of instability in the production of subjectivities. Autobiographical theories, at this historical juncture, need to evoke fractured, fragmented subjectivities as well as provoke discontinuity, displacement, and even estrangement in self-referential forms of curriculum inquiry to highlight how (self) knowledge can only ever be tentative, contingent, situated, and constantly re-situated in momentary yet swift streams of global mobilities.

From the introduction of *carrere* as a groundbreaking theoretical conception of autobiographical inquiry in the 1970s, autobiographical inquiries continue to expand in theoretical orientations and complexities. They must continue to proliferate, to challenge, contradict, and interrupt one another to address inquiries into dislocated and destabilized versions of "selves," of nations, cultures, and languages, as well as of multiple and competing transnational discourses that now frame and constitute any iterations of "identities" and subjectivities. The future task of autobiographical curriculum theories will be to conceive of methods and forms of inquiry that bring difference to the fore of the curriculum field's deliberations.

## BAKHTINIAN THOUGHT

---

Bakhtinian thought contributes to curriculum studies by recognizing that voices cannot exist in isolation; rather, our utterances represent some aspect of our interactions and experiences within society throughout the duration of our lives. In this respect, classrooms represent a microcosm of society where differing voices come into contact to construct a polyphonic truth. Individuals within a modern society must work to understand and value the voices of one another as well as to comprehend the reasons for why they speak certain utterances within specific contexts.

Mikhail Bakhtin focused his work around the notion that speech and language belonged to the social domain as opposed to being constructed within the individual. Bakhtin's theories attend to the multi-voicedness of individuals, dialogicality of meaning, the centrality of language in social contexts and meaning making. The following description of Bakhtinian thought highlights key conceptions that relate directly to curriculum studies.

### Dialogism

Dialogism argues that meaning is relative because it always represents a relationship between two objects where reality is perceived and experienced from a particular social location. The cultural tools that individuals draw upon during dialog depend upon their individual experiences and social location, meaning that their voices represent

more than just the literal meaning of the words they utilize. Speech is always contextual. Bakhtin devised the notion of utterance to argue that the locus of interaction, between both the speaker and listener, displays the sociocultural and sociohistorical worldview of the individuals engaged in dialog. Utterances reflect the sociohistorical backgrounds that inform our ideologies, and through dialog, utterances become the tools that help individuals communicate those histories. Thus, the process of meaning making and understanding must be constructed through dialog between and among social actors.

### The Novel

Bakhtin claimed that discourse embedded within the novel represented differing types of speech from multiple contexts, which he termed *heteroglossia*. When viewing these multiple voices (characters, narrator, etc.) in multiple contexts we can better understand the nature of the author's true intention. The novel highlighted the polluted messiness of the world. In addition, when characters who did not achieve resolution revealed themselves through showing rather than through telling, polyphony contests the primacy of the narrator's voice such that the self and the Other are both subjects rather than objects. Polyphony is the dialogic discourse of self and other because meaning exists only if an utterance is social or in relation to another utterance. Polyphony can thus be summarized as a relationship between "I" and another where identity formation is constructed within a

social context as opposed to solely within the mind of the individual.

### Carnival

Typically, carnival, as practiced by peasants and artisans in their feasting, game playing, and symbolic inversions, represents a malleable public space where traditional social hierarchies are dissolved and reconstructed within a new context free of hegemonic forces. Carnival is produced through the transgression of boundaries and prevailing norms, creating the inversion of hierarchies and the union of opposites. Carnival opposes a classical, serious, somber, and grave official culture that is alien to the subject. Carnival provides a glimpse into the transformative possibilities that exist outside popular tradition. Bakhtin maintains that the polyphonic truth is constructed through the spirit of carnival. During this time, multiple competing, complementary, and contradictory voices conflate to provide a tapestry of truth. A messy and impure world is carnival.

Bakhtin was born in Russia in 1895 and became one of the most important literary scholars of the 20th century. Bakhtin was part of an active group of Russian intellectuals who began building a body of literary and social theory during the 1920s. This work was dangerous considering the political climate in Russia at that time. Consequently, Bakhtin was arrested in 1929 and sentenced to exile in Kazakhstan. After serving his sentence, he returned to Russia where he lived in relative obscurity until his later life when his original works were rediscovered by a new generation of Russian intellectuals. The importance of his work was not clearly understood by Western scholars until after his death in 1975. Currently, Bakhtinian thought provides postmodern scholars with a theoretical framework for understanding the multiple and competing interests within curriculum studies.

## BALKANIZATION OF CURRICULUM STUDIES

---

Derived from political fragmentation of the Balkan Wars in 20th-century Europe, the term *balkanization* applies to curriculum studies because the discipline has also experienced processes of division into smaller entities that are hostile to one another. The phenomenon is, however, more complex and requires historical background to comprehend.

The curriculum field emerged in the early 1900s largely to facilitate the project of universal schooling in the United States. Different schools of thought about the character of curriculum inquiry emerged in what Herbert Kliebard referred to as a crucible, that is, a place in which ideas and practices of several prevailing interest groups (humanist, developmentalist, social efficiency, and social meliorist) were combined with or repelled by one another and with progressive influences of John Dewey and others. Many attempts were made throughout the first half of the 20th century to prevent balkanization and to arrive at agreed-upon ways to support curriculum development in schools. Some of these include the rise of synoptic curriculum textbooks that tried to conceptualize new common threads in diverse theory, research, and practice; many attempts by the National Education Association (NEA) to forge common statements through committee and commission reports (e.g., the Committee of Ten report of 1894, the Committee of Fifteen report of 1895, the report on the economy of time in education of 1913, the *Cardinal Principles of Secondary Education* report of 1918, and nearly 100 policy documents between the late 1930s and the 1950s by the NEA Educational Policies Commission); a project led by Harold Rugg in the 1920s to develop central questions and a common purport for curriculum scholars as guidance for practitioners and policy makers; and the formation of the ASCD (Association for Supervision and Curriculum Development) in 1943 by combining

the NEA's Department of Supervisors and Directors of Instruction with the more scholarly Society for Curriculum Study to offer a unified force to contribute to curriculum development.

Meanwhile, however, turmoil and balkanization persisted, countering attempts at centralization and unification. Those who controlled educational policy through testing and measurement were continually at odds with those who trusted expressions of personal and democratic growth. Thus, a long history of division between traditional and progressive educators ensued. In the late 1930s, there were deep divisions among progressives alone. Dewey and Boyd Bode worked to little avail, for instance, to repair bifurcations between proponents of child study and social reconstructionist camps. Within ASCD, as well, more radical scholars sought a greater forum, ultimately seeing their progeny leave that organization for others—such as the American Educational Research Association (AERA), especially its Division B (initially titled Curriculum and Objectives in the 1960s and changed to Curriculum Studies in 1982)—and an influential Special Interest Group (SIG) on Creation and Utilization of Curriculum Knowledge begun in 1972, later becoming the SIG on Critical Issues in Curriculum and more recently Critical Issues in Curriculum and Cultural Studies. Combined with a new set of conferences developed by William Pinar, Paul Klohr, Janet Miller, and others, beginning in 1973, an emphasis was initiated to reconceptualize curriculum studies by drawing upon a broader array of theory and practice that enabled greater understanding. Understanding curriculum and how it is embedded in complex social, cultural, economic, and ideological milieus was viewed by some as more important than merely researching designs to more efficiently deliver curricula mandated by governmental agencies and the corporate forces that govern them.

The emergence of curriculum scholars who sought to understand and reconceptualize curricular phenomena may be seen as a kind of balkanization. If they did not support what states wanted to be conveyed by schools, then why should states fund them? The group that began in an effort to reconceptualize curriculum studies by drawing upon diverse literatures (e.g., literary, artistic, critical theory, radical psychoanalysis, non-Western,

indigenous, feminist, phenomenology, and post-structuralist) has become known by the label *Bergamo*, taken from their most prevalent conference site. The 30-plus years of influence by this group has influenced markedly orientations to curriculum studies within AERA. A number of smaller groups have emerged as well: Curriculum and Pedagogy (C&P); the IAACS (International Association for the Advancement of Curriculum Studies) with affiliates in many nations, such as the American Association for the Advancement of Curriculum Studies (AAACS), the American Association for Teaching and Curriculum (AATC), and the Society for the Study of Curriculum History (SSCH). Each of these has influenced larger conceptions of curriculum scholarship relative to their dominant thrusts, for example, C&P on multiple orientations to critical pedagogy, IAACS and AAACS on global perspectives, AATC on the centrality of teaching in school curriculum, and SSCH on the necessity of historical perspectives. Although each of these groups contributes much more than this quick synopsis can convey, the point is that balkanization can be seen as a beneficial opportunity for sustenance that yields new perspectives to wider audiences.

The wider audiences to date, however, remain scholarly and research audiences, despite the finding that Craig Kridel revealed in an elaborate historical look at the history of Bergamo conference presentations; his study revealed that the dominant topic of such presentations has been teacher education. This emphasis is grassroots, intellectual, and reflective; thus, it differs considerably from the dominant packaged approach purveyed by ASCD in its current incarnation and is even more unlike the spate of consultants that roam the sales centers of the school business today. Therefore, the balkanization that curriculum studies decries, in its several scholarly realms, is a balkanization due to public influence. It has been argued that state and corporate interests have set the intellectual organizations (scholarly associations and department of curriculum in universities) apart, balkanizing them with the intent that they would have little influence on the sorting machine that serves acquisitive and colonial (or possible well-meaning) goals. Thus, societal powers have created outlets for publication that intentionally do not influence public policy, but instead breed contention among curriculum

scholars (of slightly different intellectual persuasions) who are influenced to police one another. This disconnection from education in the public sphere is the chief kind of balkanization that threatens curriculum studies today.

## BANKING CONCEPT OF EDUCATION

---

The idea that education can be a process of depositing, banking, or lodging information and knowledge within a passive learner has its origins with Brazilian educator Paulo Freire. The idea of banking education as it relates to curriculum studies has been given its fullest expression in Freire's *Pedagogy of the Oppressed*. What Freire was critiquing was the notion of education as a submissive act in which a largely compliant learner was a recipient of knowledge developed and conveyed by somebody else. At the core of the banking concept of education is a transmission view of education based on the belief that knowledge is mostly of a factual kind that exists in order to be conveyed to learners, who accept it without question. There are obvious similarities with John Dewey's notion of teaching by "pouring in" and of learning as a process of passive absorption.

There are several overlapping issues that flow directly from or accompany a banking view of education as it relates to curriculum studies. First, there is the question of power, or who has a legitimate right to know. Related to this question is the second aspect: the clear and unambiguous separation of the role of the knowledgeable teacher on the one hand from the deficient or less than knowledgeable learner on the other hand. Third, there is the nature of knowledge, which is seen as factual, certain, agreed upon, and therefore amenable to easy and amenable transfer from teacher to learner. It is as if there is a private granary of knowledge that is warehoused and that has to be unlocked and delivered to those unfortunate enough to be suffering from a deficiency. Fourth, flowing from these concepts is a presumption that the nature of learning, and by implication the act of teaching, is essentially about remedying a defective situation by filling knowledge deficits or gaps. Fifth, it follows, furthermore, that the nature of the relationship is a hierarchical one as between an authority who knows and a person who is underdeveloped and whose deficiencies have to be remedied or rectified. Finally, knowledge is presented as being disinterested, neutral, objective, and value-free and as purportedly being above and beyond politics.

Freire found the banking concept of education that he described to be troublesome at several levels. First, the depository view of knowledge seemed to fly in the face of reality. In many instances learners do not come to learning as empty vessels; they bring with them rich knowledge and understandings gained through the experiences of living. Second, learners do not always present as passive absorbers of others people's proclamations or diktats—human beings come to learning situations with active and inquiring minds, which make them powerful and active cocreators and coproducers of knowledge. Fourth, in the process of learning, teachers are not unaffected by the process; their students can reveal to them things they previously had not known. Power is thus much more dispersed, less hierarchical, or even inverted, and hence, learning is more democratic than a banking view of education would have us believe. And finally, as long as knowledge is treated as being hermetically sealed, then those whose dominant positions are represented in what is regarded as legitimate or worthwhile knowledge are bolstered

or buttressed against the possible incursion from those whose views are excluded, and the status quo is maintained.

The banking concept of education has clear implications for curriculum studies. Behind it is a view of curriculum as a largely settled body of knowledge, conveyed in a delivery or transmission mode, to acquiescent and passive learners. Although this might appear to have some appeal to education systems and politicians who would prefer that things be settled and that education attend to the basics in traditional ways, it is a view that to many in the field of curriculum studies is decidedly out of fashion and that resides somewhat uneasily in a contemporary world that believes in an active, inquiry-oriented, problem-posing, and inclusive approach to teaching, learning, and engagement with curriculum issues.

## **BASIC PRINCIPLES OF CURRICULUM AND INSTRUCTION**

---

Few single publications have so influenced the field of curriculum studies, both positively and negatively, as Ralph W. Tyler's *Basic Principles of Curriculum and Instruction*, published in 1949 and still in print today. Philip Jackson referred to it in the *Handbook of Research in Curriculum* as the Bible of curriculum making. In what arose from a 1940s course syllabus, Tyler developed a rationale for understanding the principles of educational programming and classroom problem solving. He maintained that his intent was never

to construct a curriculum theory, but merely to outline questions that should be asked by educators when examining their practices. His series of questions, a common communications tool that he had developed during his career as an educational consultant and program evaluator, became known as the Tyler Rationale and has served as a flashpoint for current discussions about the significance of curriculum studies.

Tyler (1902–1994) served as chair of the Department of Education and later dean of the Division of Social Sciences at University of Chicago, during which time he taught courses in education. *Basic Principles of Curriculum and Instruction* was first prepared as a 71-page mimeographed syllabus for Education 360 at the University of Chicago in the late 1940s. The content was said to have been dictated by Tyler throughout the course and distributed in sections to the students. The document was published by the syllabus division of the University of Chicago Press in 1949 as an 83-page pamphlet for Education 305 with very few changes. During the 1960s, a more standard 128-page book was prepared with a table of contents. This version is the one that remains in print today even though there have been many variations through the years in the way the questions have been summarized and abbreviated. The four questions of the Tyler Rationale (appearing in slightly restated form as chapter headings in *Basic Principles*) are as follows: What educational purposes should the school seek to attain? What educational experiences can be provided that are likely to attain these purposes? How can these educational experiences be effectively organized? How can we determine whether these purposes are being attained? A fifth question, how can a school or college staff work on curriculum building, constituted the final chapter of the publication and addressed the application of the rationale. At the 1976 Milwaukee Curriculum Theory Conference, Tyler mentioned that although the questions remain significant, he would give more attention to the role of the learner and the nonschool dimensions of curriculum design and development.

The rationale rests upon a conceptual foundation, as articulated by Tyler, to help the student of curriculum and instruction understand the formation of educational objectives. Objectives arose from three sources—the needs and interests of the

learners, examination of society (life outside of schools), and recommendations from content specialists—and the final determination of objectives (leading to purposes) is guided by two screens (or filters): (1) social philosophy that examines objectives in relation to a conception of a good life and a good society and (2) the psychology of learning that serves to define conditions that would lead to the fulfillment of objectives. In the final chapter, on curriculum implementation, Tyler states that curriculum design and development should not follow a rigid sequence of steps.

For Tyler, the rationale is seen as defining the elements of curriculum planning, and any of the four questions may serve as an entry point for the process of design and development. In his prior role as a curriculum consultant while engaged in service studies with classroom teachers, his first comment to anyone engaged in curriculum development consisted of articulating and naming the problem. Tyler's caveat that the rationale was not conceived as a linear model becomes more apparent when one views his questions as a conversation about problems (which would serve to define the nature of the curriculum design and development).

With the appearance of this publication in the early 1950s, at a time when school systems were being consolidated and curricula were being standardized, educational administrators found in Tyler's publication a simple way to better understand curriculum (in relation to instruction and evaluation). *Basic Principles of Curriculum and Instruction* offered a clear description for an administrative approach to the field, popularizing professional terminology of continuity, sequence, and integration, serving as a primer for the construction of resource units, core curriculum, general education, specialized education, and describing the then evolving conceptions of student and program evaluation and the terms *objectivity*, *reliability*, and *validity*. Tyler's ability to clarify procedures and to state ideas in simple ways has been noted by many. The publication permitted educational administrators to bypass additional professional development workshops in the evolving field of curriculum and with a careful examination of *Basic Principles*, to talk with clarity and confidence.

One problem with this famous publication, however, was that it turned from being read to

becoming myth. Tyler's use of the word *behavior* was often translated by others into an endorsement of behavioral objectives, even though Tyler maintained that behavior was not limited to overt behavior and that he disagreed with the behavioral objectives movement that reduced education to mere training.

*Basic Principles of Curriculum and Instruction*, embodying the most fundamental attributes of 1950s and 1960s curriculum design and development and representing a type of production model for curriculum construction, was reappraised in 1971 by Herbert Kliebard in what became a major event for helping to establish the reconceptualist movement. Kliebard questioned Tyler's assertion that *Basic Principles of Curriculum and Instruction* was a value-free curriculum development process. Further, he maintained that the rationale oversimplified formulating objectives and selecting forms of evaluation and that its very rationality obscured the complicated issues and problems that must be addressed for the process of curriculum design and development. When Kliebard, in "Reappraisal: The Tyler Rationale," noted that much ideological blood had been spilled in the previous decades among competing curriculum studies doctrines, he also helped to usher in an era of ideological critique regarding the importance, significance, and usefulness of what is considered one of the more important curriculum books of the 20th century.

## BAUDRILLARD THOUGHT

---

Jean Baudrillard (1929–2007) has been hailed as a genius and as one of the most forward thinking social theorists of the 20th century, who utilized Marxism and theories of consumerism first and later utilized semiotics to explore everyday life. He reveled in the role of theoretical provocateur whose major contributions to theory and curriculum studies are simulation and hyperreality—that is, disrupting the assumption that it is possible to represent a foundational reality. Simultaneously, Baudrillard was reviled as an imposter, unnecessarily theoretically dense, and lacking in rigor. The breadth of Baudrillard’s impact within curriculum studies was broad: from new media and technology studies to creating productive analytical tools for the studies of consumerism and curriculum, educational methodology, and sociology of education. The concepts of simulacra and hyperreality disrupted the ways in which curriculum might be offered and altered how researchers and theorists might consider the role of education and the construction of knowledge within educational spaces.

Baudrillard was born in Rheims, France, and was the first in his family to attend university. He taught German at the high school level and employing a largely Marxist theoretical frame, completed a PhD (under Lefebvre) in sociology at the relatively advanced age of 37. Soon thereafter, Baudrillard began his academic career at University of Paris (Nanterre).

Baudrillard’s early studies, *System of Objects* and *The Consumer Society*, focused on the ways in which late capitalism precipitated a change in consumerism. Toward the end of this period, Baudrillard began to apply the work of linguist Ferdinand Saussure and relocated the focus of study from the object that was to be bought (sign usage) to the sign-value or image of the commodity. Initiating his break with Marxism, Baudrillard explored the ways an individual functions within a system of signs when acquiring and consuming goods.

Baudrillard completed his most influential work on the concepts of hyperreality and simulation from 1972 to 1982. Baudrillard interrupted the, at that time, epistemological reliance on a direct connection between a representation (that which represents

the real) and the external object (the real). In this stance, a researcher or theorist could offer an authentic, true representation of that which was studied. Alternately, any representation, Baudrillard argued, were a simulacra, simulations or copies of reality without a linkage or referent to the real. Rather, signs and images (media representations, for example) have become that upon which the real is judged, analyzed and become the real upon which new representations or images rely. However as copies, they are unanchored and decontextualized reproductions of reproductions, or hyperreality. Hyperreality questions any possibility that representations within media (and elsewhere) could be tied to the material world. Thus the material world, as the entity upon which analysis and theory rely, lost its meaning. Baudrillard argued that hyperreality replaced any possibility of realness; the illusion became the reality. In this spectacle of hyperreality, authenticity is lost to the illusion of authenticity borne of the image. Reality has become our simulation of it.

Within curriculum studies, Baudrillard offers avenues to, as Trevor Norris suggests, analyze the role of consumerism and the dangers of such conceptualization within curriculum where knowledge has become consumable, a commodity marked by hyperrealities, but rarely analyzed as such. That is, in the present moment, teaching, learning, and consumerism cannot be disentangled from popular culture, the spectacle of media and the imaginary representations about education, and its influences. That is, the realm of the real within schooling can be analyzed through Baudrillard’s questioning of reality and our comfort with simulation.

Baudrillard’s refutation of a truthful representation adds support to those whose methodologies in curriculum studies have forefronted the failure of terms such as *good student*. If the representation of good student is interrupted and perpetuated within meanings detached from that student, if it is a simulacrum, how does a researcher analyze what is true or advocate for a faithful representation of the student, curriculum, or research? Baudrillard’s work calls into question the possibility of research that represents a singular truth; it calls for a range of truths understood as partial.

The critiques of Baudrillard have been many; however, within curriculum studies, Deron Beron asks if Baudrillard’s claim that the determinism of

the simulacra and hyperreality precludes youth agency and a youth-driven critical analysis of schooling. Others argue that the inevitability of the simulation leaves little room for youth disruption of the simulacra. Is it possible and productive, these critics would ask, to problematize consumerism, the pedagogical uses of the use of media and popular culture, if they are doomed to circle back on themselves? Are there ways, as proponents of Baudrillard have argued, to read his theories outside of a mass uncritical consumption?

At the very least, Baudrillard's theories require an interrogation of representation within curriculum and pedagogies, and some would argue that the role of theoretical provocateur who troubles the commonsense notions of the real is legacy enough.

## BEHAVIORAL PERFORMANCE-BASED OBJECTIVES

---

Behavioral performance-based objectives in curriculum refer to lesson objectives for students set by the teacher that are precise and observable, for example, "The student will demonstrate the ability to add integers where regrouping is needed." Behavioral performance-based objectives have become increasingly important in the field of curriculum studies as teachers work with their students to demonstrate mastery of objectives in high-stakes testing. This type of objective became popular in the 1970s when behavioral science was at its peak and when B. F. Skinner, a prominent behavioral scientist, claimed that all human learning was a result of stimulus-response. Skinner believed that by observing the response we would observe learning. Objectives such as "The student

will understand the meaning of place value" were pushed aside to make room for "The student will show understanding of place value through converting number words such as 'one hundred and one' into its numeric equivalent with 90% accuracy." Teachers infer knowledge on the part of the student by the student's ability to perform a task. Performance based meant that the learning was reflected through some action by the learner, whether it was serving a volleyball in physical education or solving an algebraic equation in writing. By reducing all learning to behavioral objectives that could be observed, assessment of learning became more precise and more easily measured.

Learning objectives are normally set for each lesson by the teacher, and they should drive the instruction and the assessment of student learning. They are written in response to goals and standards for curriculum usually set by the district and/or state. In this era of high-stakes testing, having students demonstrate learning through behavioral performance is taken seriously in the field of curriculum studies. The focus has shifted from what was taught to what was learned. No longer is it sufficient for the teacher to cover the subject. The students must demonstrate they have learned the skill or concept through their observable actions or satisfactory performance utilizing the skill or understanding.

Each behavioral performance-based objective should have the following four parts: (1) the type of knowledge being inferred, for example, factual, procedural, conceptual; (2) the behavior the learner will exhibit; (3) the conditions under which the learning will be exhibited; and (4) the parameters of the student's performance such as time limits, order of information, and so on.

The focus on writing behavioral performance-based objectives is on the verb, which needs to be an action verb and the level of success expected. "The student will write three sentences using capitals and ending punctuation correctly 80% of the time" is an example of a behavioral performance-based objective. In contrast, "The student will know when to use capitals and ending punctuation" is not a behavioral performance-based objective because there is no observable action to show the student possesses the knowledge. Objectives also should include the conditions under which the

performance occurs. Such as “After reading *The Scarlet Letter*, the student will write a letter to Hester from Mr. Dimsdale’s point of view, using appropriate grammar, letter form, and point of view.”

Many curriculum standards today reference intended learning outcomes, which may be written as a behavioral performance-based objective or not. In the field of curriculum studies, there are opponents of behavioral performance-based objectives. These opponents state that not all learning results in observable behavior and trying to reduce all learning to behavioral objectives results in trivial and often rote learning as opposed to concept attainment and learning the big picture. Although behavioral objectives can be written for concept attainment and other higher level thinking skills, it is true that most often the behavioral objectives reflect the lower levels of thinking such as knowledge and comprehension. Another criticism of behavioral performance-based objectives is that they seldom reference the affective domain. Many teachers have a goal of students valuing or appreciating a content area such as communication skills. Finally, behavioral performance objectives can be so specific and of such small scope that they proliferate to the point of overwhelming the teacher.

The current emphasis in curriculum studies on the tested curriculum and student achievement on high-stakes tests brings the focus back to behavioral performance-based objectives usually aligned with the tested curriculum. Because the standards are written in broad terms, many teachers turn to the tested curriculum and the format of the test to create behavioral performance-based objectives where the type of knowledge, the behavior, and the conditions of the objective align with released test items. This structuring of the objectives in turn narrows the scope of their curriculum. As an alternative, teachers may align their student objectives with the broader curriculum and standards and reflect the quality of the student’s performance through a rubric. Exemplars may also be used with this type of assessment of the student’s performance.

## BENCHMARK ASSESSMENT

---

Benchmarking is the practice of identifying, understanding, and adopting the successful business practices and processes used by other companies to increase success. In terms of curriculum studies, benchmark assessment is the means of assessing student knowledge for the purpose of being accountable or competitive, resulting in curriculum decisions being based on what other schools and school districts do for their students in another place and time rather than on the needs of one’s current students.

Linked to the concept of mastery, this practice has its roots in the Middle Ages where the guild required a masterpiece for admission into a trade. The later roots of this current educational practice came from the Xerox Corporation where it was developed to improve the company’s performance in the face of increasing international competition. It is this factor that is probably most closely tied to the efforts to make the curriculum more relevant to a global market and to make schools, teachers, and students more accountable and more competitive.

Although it does involve learning from one’s competitor, benchmark assessment is more focused and narrowly defined for educational purposes. In terms of the teaching and learning process, assessment refers to activities used by teachers to evaluate students’ work. Thus, benchmark assessments serve as indicators of the students’ overall performance and knowledge base for the entire school year as well as their likely performance on accountability assessments. With benchmark assessments, teachers and administrators are supposed to be able to identify those students in need of additional instruction or instructional intervention.

In a move toward increasing global competitiveness as measured by standardized test scores, the

U.S. federal No Child Left Behind Act (NCLB) signed into law in late 2001 aimed for a uniformity of goals, curriculum, teaching methods, and assessments. At the center of NCLB is the use of standardized tests to document the achievement of students and schools. The basic premise is that this uniformity offers the most straightforward means of addressing the inequities that exist among classrooms and schools by providing equality of curriculum and instruction that are measured by the benchmark assessments. To improve student learning across the country, all students must receive the same education and be held to the same high standards on standardized tests.

Tied to the use of content standards that set the directions for the curriculum content, benchmark assessment is being used as the means to satisfy the need for public accountability that currently requires that skills and knowledge be tested and results made public. Benchmarks specify what the students should know and be able to do as a result of instruction and are easily converted into test items—hence benchmark assessment. Thus, these benchmarks can set the conditions for a test-driven curriculum, particularly in a high-stakes context, such as NCLB.

Large scale testing as mandated by this federal law can result in several unintended consequences for students, teachers, and school systems. Many school administrators view centralized curriculum and prescribed instructional programs as the most direct way to increase student test scores, even though these types of assessments narrow the curriculum by emphasizing basic skills and not higher order thinking skills. These assessments also tend to detract from authentic teaching and learning, and student motivation for learning can be negatively impacted resulting in a higher dropout rate when high stakes such as graduation are tied to the test results of benchmark assessments. Benchmark assessments also narrow the professional discretionary space of teachers in making professional decisions about what to teach and how long to teach it if the subject is not tested by the state.

Perhaps one of the most negative consequences of NCLB is due to the standardization of the teaching and learning process that decreases interest in and understanding of curriculum studies. As a result, teachers' professional discretion is being constrained in all subject areas, but especially in

those subject to high-stakes testing. By deskilling teachers, this reductionism leads to classroom decisions being circumscribed by pressures and time demands that devalue teachers' professional experience, judgment, and expertise. This narrowing of discretionary space is further exacerbated by administrators who, under pressure to increase test scores, increasingly choose to mandate curricular and instructional choices as means to control what happens in the classroom, thus hopefully improving test scores as identified by benchmark assessments.

## BERGAMO CONFERENCE, THE

---

The Bergamo Conference is an annual meeting of curriculum theorists and practitioners at the Bergamo Center in Dayton, Ohio. The conference started as a series of annual meetings beginning in the early 1970s that were hosted by various curriculum leaders at their home institutions with the first one being hosted by William Pinar at the University of Rochester. Subsequent meetings were held at or near other major universities in the Midwest and in the East. By the late 1970s, the meetings briefly found a home at the Airlie House, a rather rustic conference center outside Washington, D.C. These early years of the conference were marked by major presentations by leading figures in the field of curriculum theory, many

of whom had been highlighted by Pinar in his book *Curriculum Theorizing* in 1975. These theorists included James Macdonald, Dwayne Huebner, Maxine Greene, Paul Klohr, Ted Aoki, and the students whom they had influenced and mentored into the field.

By 1983, the conference sought a permanent home, and through the efforts of administrators and faculty at the University of Dayton (Ohio), the Bergamo Center, which was affiliated with the University of Dayton, was identified as that site. From 1983 to 1993, the Bergamo Center (and hence, the Bergamo Conference) became the primary location for both established and emerging leaders in the field of curriculum theory to present thoroughly articulated as well as nascent theoretical positions in a supportive and engaging environment.

The influence of the presentations made at the Bergamo Conference cannot be overestimated. Ideas and theoretical positions that were frequently ignored or rejected by mainstream conferences such as American Educational Research Association (AERA) or ASCD (Association for Supervision and Curriculum Development) in the 1970s became central themes of the Bergamo Conference and subsequently redirected the field to such an extent that by the early 21st century they had become highly visible at AERA, its Special Interest Groups (SIGs), and most professional education organizations. These ideas and theoretical positions included such methodologies and theories as qualitative research, autobiographical and phenomenological research, gender studies, critical theory, hermeneutics, postcolonialism, and so on. The Bergamo Conference provided a forum and incubator for new, emerging, avant-garde research, and it literally redefined the field of curriculum theory in the last quarter of the 20th century and the early years of the 21st century.

Like many cutting edge organizations such as the Progressive Education Association, the Bergamo Conference experienced its periods of growth and decline. From its halcyon years of the early 1980s to mid-1990s, its attendance declined from a high point of over 400 attendees to a low of under 100 attendees in the middle of the first decade of the 21st century.

After a 5-year hiatus when the conference met at a different site, the conference returned to the

Bergamo Center in 1999. The conference organizers sought to sustain both the original intent and purpose of the conference sessions, and they were largely successful in doing so by attracting a new generation of graduate students and faculty just entering the field. The Bergamo Conference continues to attract an audience of curriculum theorists eager to present new ideas and perspectives and to allow for supportive critique of emerging theory. The rich history and influence of the Bergamo Conference appears poised to continue into its fifth decade.

## BERMAN, LOUISE M.

---

From the first book that brought Louise Berman recognition as a scholar in the field of curriculum studies (*New Priorities in the Curriculum*, 1968) to her present scholarship, the centrality of ethical decision making to improve the human condition is her continuing priority for curriculum. The influence of her humanities-inspired approach to curriculum studies can be traced to her childhood, educational pathways chosen, and her compelling interest in literature and language as a prior student of English literature. Just as the humanities seek to explore and understand forms of human existence with a focus on the ethical life, the just

society, and educated citizenry, the themes in Berman's curriculum scholarship reveal her commitment to these ideals. The heart of her curriculum inquiry is rooted in norms, values, judgments, and decision making that enrich the human spirit. Berman was born in 1928 in Hartford, Connecticut. Growing up in the Depression era, Berman experienced a home that was opened to strangers who gathered around the family table, bringing stories of their hardships as well as of their joys. She was witness to the alleviation of suffering as her family helped refugees fleeing from war-torn Germany. These life lessons followed her through undergraduate studies at Wheaton College in Illinois (BA 1950) and graduate school (Teachers College, MA 1953 and EdD 1960) where the human condition found its claim on her through literature, especially poets, from around the world. But it was in her work with children while at Teachers College as a kindergarten and elementary teacher in lab schools linked with Central Connecticut State College that she made her turn to curriculum studies. She also taught in several private and public schools. Under the mentorship of Alice Miel, Berman came to share an interest in democracy and education, a consequent grounding for Berman's development of ethical decision making.

Upon completion of her doctoral degree, Berman went to the University of Wisconsin, Milwaukee where she taught general curriculum and supervision courses from 1960 to 1965. Her interest in international education brought her to Latin America during this time to conduct research in a community development project, an interest that she later continued in a teaching context.

In 1965, Berman became Associate Secretary of the ASCD (Association for Supervision and Curriculum Development), a position she held for 2 years. Throughout this time, her scholarship evolved from prior projects begun at Teachers College. From a Seminar on Creativity in which Berman assisted Alice Miel, to participation in a workshop for international students, she began her founding scholarship with the publication of a handbook for teachers (*From Thinking to Behaving*, 1967) that became the basis for her first major book (*New Priorities in the Curriculum*, 1968).

While at ASCD, her interest and commitment to international education grew as she sought to

increase the role of ASCD in international understanding. She recommended that a commission on international education be formed with Miel as chair of this ad hoc group. The first international conference was held at the Asilomar Conference Center in Pacific Grove near Carmel, California, in 1970. From this conference, the World Council for Curriculum and Instruction was born in 1971, an organization for which Berman was a founding member and to which she has been committed throughout her professional career, becoming the third president, from 1979 to 1981.

In 1967, Berman became a professor of curriculum at the University of Maryland, Department of Administration and Supervision and also served as the director of the Center for Young Children from 1967 to 1975. Her rise as a scholar in curriculum studies was swift from three early interrelated books that marked her scholarship in existentialist dimensions of the person through process-oriented approaches centered on the following concepts: perceiving, communicating, loving, decision making, knowing, patterning, creating, and valuing (*New Priorities in the Curriculum*). Always concerned with helping teachers and schools work with children and adolescents in the development of these dimensions of thinking and being, she expanded these concepts in the book *Curriculum: Teaching the How, What, Why of Living*, 1977, coauthored with Jessie Roderick. Three pervasive themes guided this work: persons and social settings, decision making, and peopling (living life fully with others). Also in 1977, she coedited an ASCD yearbook with Roderick, *Feeling, Valuing and the Art of Growing: Insights Into the Affective*.

Berman's scholarship and teaching evolved in her work with doctoral students and colleagues as she drew on phenomenological foundations. Two significant texts written with Francine Hultgren and doctoral students illustrate this work: *Toward Curriculum for Being: Voices of Educators*, 1991, and *Being Called to Care*, 1994. Throughout her prolific career, her scholarship continued to reflect her core themes around the struggle to become more human. A hallmark question that echoes throughout her scholarship is the following: What does it mean to dwell in ethical community?

Berman has been a sought-after senior curriculum scholar through numerous visiting professorships and curriculum project consultancies around the

country and world. She was recognized with the Distinguished Alumni Award at Wheaton College in 1981, and was awarded Distinguished Contributor to Curriculum in Division B of the American Education Research Association in 1983. Many additional honors and citations recognize her significant contributions to curriculum studies, two of which are being elected to the Professors of Curriculum Group and Laureate Counselor to Kappa Delta Pi.

In 1992, Berman retired from the University of Maryland. As a testimonial to the vast number of doctoral students she mentored, the Louise M. Berman Curriculum Award was established in her honor to forward the educational ideals of her lifetime commitment to inquiry into the human condition and cross-national projects that are designed to encourage dialogue across diverse groups of people. Berman's legacy to curriculum studies is exemplified in this award.

Berman was inspired by the humanities, and she inspired her colleagues, students, and curriculum studies through her valuing of the poetic. Through these poetic contributions to curriculum studies, Berman has revealed a way to bring about expression of the inner self and opened possibilities for defining and creating more just and compassionate worlds. And the priority for her has always been to ask and live in provocative questions that are most central to the human condition—enhancement of persons dwelling in community.

## BEST PRACTICES

Best practices tend to be those that are suggested by respected professionals as well as those for which there is some level of research regarding the usefulness of the practice. Although evidence-based practice is used in various fields such as medicine and nursing, it has not always been used in curriculum in particular or in education in general. At one time, teachers based their curricular decisions on their personal perspectives as well as on their knowledge about the students in their classrooms. This personal perspective served as a filter or lens through which they either accepted, rejected, or interpreted new practices for their classrooms. A further consideration for teacher practices was that the external expectations imposed policies that did not usually correspond to the teachers' opinions or conceptions of what constituted "good" teaching.

Prior to the current climate of a standardized curriculum and best practices as defined by others than the classroom teacher, best practices tended to evolve from workshops, professional development series, and from research. Because teaching is a personal and private endeavor, teachers viewed a change in their practices from the perspectives of what they changed and what prompted the change. Thus, teachers were the ultimate arbiters of what was taught (and how). They made decisions about how much time to allocate to a particular school subject, what topics to cover, when and in what order, to what standards of achievement, and to which students. Collectively, these decisions and their implementation defined the content of the curriculum. Using their best judgment in making these decisions, teachers received advice and support from a variety of sources, including and perhaps especially from each other, as to what constituted best practice in the classroom.

That has changed, however, since 1983 with the publication of *A Nation at Risk* and even more so since the passage of the federal No Child Left Behind law in 2001. Now federal and state education agencies have directed huge resources into identifying and promoting the use of best practices by teachers and other educators so as to improve student achievement as measured by standardized tests. The argument for best practices is that they represent the hope that a systematic comparative

evaluation of different programs or program components would yield definite conclusions about what were the most effective, best ways to teach, to deliver the curriculum, and to improve test scores.

Critics contend that such a comparative analysis is difficult when programs have different goals and schools serve different populations with different needs. Best practices need to be specific in identifying best for whom, under what conditions, for what purposes, in what context, with what evidence and criteria were they judged to be best, and in comparison to what alternatives. At the heart of best practices is the concept of generalizability that means that the practice can be successfully transferred to any other similar setting.

Clearly, the concept of best practices was conceived of and touted to be the simplification of the complex task of teaching. As a nonlinear task, however, teaching does not easily lend itself to being reduced to a formula or to a recipe. Nor is teaching a dispassionate act having no emotional connection to each other or to the topic being studied. Finally, teaching at its best and with its most potency calls for a search for meaning, for significance, and for making a difference in the lives of students. The identification of best practices by other entities outside of the personal classroom makes the teaching and learning process external. As scholars in the field of curriculum studies have demonstrated, best practices also deskills teachers, and it leads them to question the relevance of their work over which they now have such little control. The argument could be made that best practices are the culmination of the 1960s movement that moved curriculum studies away from the center of school work toward the error proofing of the teaching-learning process.

As the gold standard for what works best in classrooms, current best practices have been identified through research studies that critics argue tended to discount tremendously useful information about the conditions under which successful teaching and learning occurred. In other words, the studies failed to capture the big picture of how ideas, theories, and personal connections interact to create a learning situation. By looking for a representative sample, researchers lumped all learners together as if they all learned in the same way, under the same conditions. The differences and difficulties that learners bring to the classroom are not seen as a part of the teaching-learning equation. Because it is

these statistical research studies that are accepted as “real” research now by government funding agencies, school districts now make curricular decisions for teachers based upon the best practices from other districts from other regions in the country.

Because statistical studies are used to help identify best practices, it is also easier now to tie the best teaching practices to benchmarking that calls for identifying, understanding, and adopting the successful practices and processes (best practices) used by other schools and systems who have significantly improved student learning and achievement as defined by the standardized curriculum, methods, and assessments. With the educational system currently focused on standardization of curriculum, instruction, and assessment as the means to ensure that students are learning, teachers are now encouraged—in fact, required—to be compliant deliverers of what someone else has determined as best practice with quality control in the guise of standardized test scores.

## BILINGUAL CURRICULUM

---

Bilingual curriculum, or a curriculum that is bilingual, refers to subject matter content taught and

learned in two languages. Variations in instructional program models and teaching strategies are influenced by an intricate combination of issues including inadequate funding, national identity, teaching philosophies, and diverse political ideologies. In the United States, a bilingual curriculum includes English as one of the languages. Students enrolled in bilingual curricular programs are identified as English learners. One of the goals of a bilingual curriculum is to ensure that all students in public schools learn to speak English. A discussion of the history of bilingual education, current language policies, and instructional program models follow.

Decades of theory, scholarship, and empirical research have informed practices of a curriculum that is bilingual. Various teaching strategies and modes of instruction falling under the definition of bilingual education have evolved over time. Historically, bilingual education was common in the ancient world. A scarcity of written resources created a need for people to be literate in multiple languages in order to share and access limited materials. Today, in most parts of the world, bilingualism and bilingual education are the norm. However, in the United States, bilingual education has a complex history marked by conflicting theories, ideologies, and language policy trends. When European explorers came to the New World, what is now the United States, there were between 250 and 1,000 indigenous languages. Carlos Ovando, a bilingual education scholar, maintains that the cultural and language differences between the indigenous people and the Europeans initially set the stage for linguistic controversy that continues today and is fueled by issues of power, ethnocentrism, and cultural and national identity.

In 1974, language policies were initially legislated by *Lau v. Nichols*, the landmark U.S. Supreme Court case that first addressed the academic language instruction of non-English-speaking children in public schools. Informed by the 1954 decision in *Brown v. Board of Education* and Title VII of the 1964 Civil Rights Act, the Supreme Court stated in *Lau v. Nichols* that equal education for all students could not exist if non-English-speaking children were taught in a language that they could not understand. The Court stated that native language instructional support for non-English-speaking students must be provided to make certain that their learning opportunities were equivalent to

English-speaking students'. As significant as the *Lau* decision was to bilingual education, the Court did not define the nature or type of instruction needed to support the schooling of non-English-speaking students.

The ambiguity of the *Lau* decision resulted in other law suits, such as *Otero v. Mesa County School District No. 51* (1977), *Guadalupe v. Tempe School District No. 3* (1978), and *Aspira of New York, Inc. v. Board of Education* (1975), that attempted to explicitly recognize native language instruction as an important component in the schooling of English learners. In terms of program models, the variety of instructional approaches stimulates debate regarding which is the most effective in teaching English learners in schools. In addition, bilingual language programs vary considerably in terms of district funding and support, academic and language goals, the percentage of instructional time allotted to the child's native language, and the amount of time devoted to English.

Some programs focus on developing biliteracy, literacy in both English and another language. These programs are known by various names: two-way bilingual education, bilingual immersion, dual language immersion, and two-way immersion. Although other student ratios exist in these programs, the ideal situation in this model is classrooms with half native English speakers and half native speakers of the same non-English language. In this model, both groups are immersed in a non-native language and both develop native and second-language knowledge, skills, and competencies. Other biliteracy instructional models, such as developmental bilingual education, late exit programs, maintenance education, and heritage or indigenous language programs, segregate non-English speakers. Generally, in these language programs, the native language is used extensively in the early primary grades and decreases as students move into the intermediate grades. A goal is to eventually remove students from a language program and transition them into classrooms with all English instruction.

Some of the most popular and most limited bilingual education programs disregard the maintenance and development of the home language and focus exclusively on English acquisition. The major goal is to transition students as quickly as possible into classroom with instruction only in

English. It is assumed that teachers receiving these emerging English learners have teaching skills in English as a second language. Models under this type are known as early exit, transitional bilingual education, sheltered English, content-based English as a second language, specially designed academic instruction in English, and structured instructional observation protocol.

Theoretically, regardless of the language program model used, a curriculum that is bilingual provides non-English-speaking children a greater opportunity to learn. Proponents of bilingual education expect equitable language learning conditions for linguistically diverse children and acknowledge that children in the United States learn English. Because language is a critical tool for learning, advocates point out that English learners need instructional support in their native language. Attention to the language needs of linguistically diverse children provides comparable services that are readily available to monolingual English-speakers.

## BIOGRAPHICAL RESEARCH

---

Biographical research in curriculum studies constitutes the study of a life, focusing primarily upon an individual who in some way is affiliated with the professional field of education and specifically with the field of curriculum, broadly conceived. Many other research methodologies for examining a life exist in educational studies—life history writing, portraiture, oral history, memoir,

autobiography, narrative inquiry, and teacher–student lore—and are situated primarily within social science research traditions of qualitative research. Biographical research, in contrast, is aligned more with fields in the humanities—literature and cultural studies—however, most biographical research in curriculum studies is still guided by traditional research conceptions from the field of educational history. Five basic types of educational biography exist in curriculum studies: scholarly chronicles, intellectual biography, life history writing, memoir biography, and narrative biography; these orientations may take the form of full-length books or vignettes. Yet, biographical inquiry has been slowly supplanted in the qualitative research literature in education. Its presence, although highly popular with the general reading public, has yet to be fully accepted in the field of curriculum studies.

The most fundamental type of biographical research in curriculum studies is described as scholarly chronicles, with a focus on the documentary, historical portrayal of an individual life. This traditional research orientation involves telling the subject’s story in chronological order with emphasis upon developing a quest plot (life pattern-stage) and describing those life periods of recognition (or notoriety). Such biographical scholarship is commonly embraced by educational and curricular historians and remains popular in the field of education. The scholarly chronicle is often viewed as synonymous with biography; however, this research orientation is markedly different from another form of scholarship, intellectual biography with its focus on a conceptual analysis of the subject’s motives and significance in the world of ideas. The intellectual biography, exemplified in the work of Leon Edel, defines human character and constructs an agreeable aesthetic shape to the writing. One need not draw fine distinctions between these areas; realms are crossed continually as the intent and purpose of the biographer become more clearly defined. Those writing intellectual biography have often overcome the interpretive angst displayed by many educational researchers who include pages of student–teacher transcripts in their articles, but who refuse to interpret motives and feelings.

A third form of biographical research is defined as life history writing (and the narrative study of lives) with an accompanying allegiance to social science research traditions. This research type has

taken many forms, perhaps resonating most in the area of teacher education with the burgeoning first year teacher research and the study of teachers' lives scholarship. In recent years a fourth form, memoir biography (still distinct from autobiography) has begun to appear with a focus upon the researchers' motives in relation to the biographical subject. The analysis of the writer alongside the biographical subject becomes part of the research. A life story is being told, but in relation to the transactional experiences of the biographer that in turn influences and foreshadows similar experiences of the reader. The fifth type, narrative biography, represents a dynamic portrayal of a life without the need for absolute facticity or a comprehensive account from birth to grave. Neither is this style burdened by the definitive interpretation of the subject that must be accepted by the reader. Facts are recognized, and some interpretations prove more thoughtful than others, but the biographer, though consciously aware of his or her personal emotions and reactions to the subject, acknowledges that the telling of the story is primarily defined by the subject in relation to the reader. Narrative educational biography insists that the significance of the biographical subject is constructed in relation to the anticipated needs and interests of the reader. Interpretive biography is not recognized as a distinct type of scholarship because all biography should be viewed as interpretive.

During the current era of blurred research genres in curriculum studies, fine distinctions cannot always be drawn between biography and other forms of qualitative research. Nuances of research methodology, however, become quite clear when considering the way in which the biographer perceives the biographical subject and treats research materials—documents, interview transcripts, material culture. Insider–outsider relationships, interviewee sense of trust, and triangulation—these defining methodology topics of the ethnographer and oral historian prove not as important to the biographer as other crucial topics and perspectives. In contrast, interpretive and documentary issues of biographical inquiry cause researchers ultimately to define themselves and their craft. Interpretive research issues include (a) establishing the biographer's voice and the manner in which the subject will be portrayed (elicited rather than refashioned), (b) ascertaining the existence of nature and character (Edel's "figure under

the carpet") or dismissing any conception of a unifying essential self, (c) defining the parameters of research accuracy and biographical truth, (d) determining the biographer's relation and fascination with the subject, and (e) articulating moral judgments made by the biographer. Documentary research topics include (a) deciding which biographical gaps in the life of the subject will be filled and how information will be obtained and conveyed, (b) addressing issues of copyright and archival access, (c) ascertaining the archival significance and importance of documents and interviews, and (d) articulating the biographer's ethics of documentation and the appropriate use of private information being made public. These topics may not be addressed in all forms of biographical research; the issues remain crucial for the thoughtful biographer and are markedly different from those questions posed by researchers who work in other forms of qualitative research. Further, these topics create a dramatic divide between biography and autobiography. Although some qualitative researchers view the term *auto/biography* as being descriptive and accurate, there are dramatic differences between biography and autobiography—much more than any slash or solidus can convey.

## BLOCK SCHEDULING

---

Block scheduling is a class schedule alternative that offers fewer classes each day for longer blocks

of time. Following the publication of *A Nation at Risk* in 1983, public schools in the United States entered a period of reform and restructuring designed to improve student academic performance and to make better use of instructional time without lengthening the school day. Reformers called for a creation of smaller schools, the development of a standard core curriculum, the elimination of student tracking, and a reexamination of the use of time. Changes to pedagogical practices and the curriculum demanded more flexible scheduling. In the face of these demands, many secondary schools implemented variations of block scheduling based on Trump's Flexible Modular Scheduling Design. Robert Lynn Canady and Michael D. Rettig identified five basic scheduling models used in schools across the United States, four of which were block scheduling models. The two most frequently implemented models were the  $4 \times 4$  design and the alternating day (or A/B) design. In the  $4 \times 4$  design, four classes meet 90 minutes per day for 90 days, followed by another four classes, and so on. In the alternating day design, classes meet 85–100 minutes per day every other day for the duration of the school year. By the year 2000, an estimated half of U.S. high schools had tried some form of block scheduling in efforts to improve the use of instructional time.

Quality and quantity of teaching and learning time were the major concerns to be addressed in the changes of schedule. Theoretically, in a longer block of instructional time, teachers and students have more time for exploration, delve more deeply into specific topics, and focus more on project- and problem-based tasks. Teachers enjoy increased planning time, face reduced preparation and grading duties, participate in professional development to diversify teaching techniques, and increase collaboration among students. Block schedules provide a less industrial, less compartmentalized framework for teaching and learning, encouraging teachers to work together across disciplines to function in teaching teams and to focus on contextual teaching. Block scheduling affords schools the opportunity to include more advanced subjects in the curriculum. Students are able to complete more courses in 3 or 4 years of high school block scheduling than in 3 or 4 years of traditional seven-period day scheduling, increasing their preparedness for the work force or for higher

education. Further, the extended time available per class session in a block schedule allows the curriculum to be focused on student engagement and learning rather than on materials available, teacher convenience, or administrative preference.

Teachers and students who participated in early block schedule reforms reported positive results in modified curriculum and instructional approaches. More time was spent on activities other than teacher-centered lectures. Students settled more readily into class activities and caused fewer classroom disruptions, resulting in fewer disciplinary issues. Teachers expanded the content of lessons and both deepened and broadened the required curriculum: Students participated in more independent projects and in some teaching activities with classmates. Because block schedules allowed time to cover concepts in more depth, both teachers and students found their work more interesting, engaging, and challenging.

However, no empirical data have shown conclusively that participation in block scheduling affects student academic performance, either positively or negatively. Results of some school-based studies have been refuted by the results of other studies. Further, in some cases, improvement in student test scores during the first year of implementation have been negated by losses in subsequent years. The most consistent improvements in academic performance data have occurred in schools that combined some block scheduling with some traditional, based on individual student strengths and challenges.

Positive nonacademic outcomes, on the other hand, have been widely reported and documented. These outcomes include improved class climate, enhanced opportunities to experiment with teaching techniques, fewer discipline problems, improved student interaction, and increased parent and teacher satisfaction with local schools.

## BORDER CROSSING

---

Border crossing is a central concept in the field of curriculum studies. It reflects a profoundly democratic vision of curriculum and locates a set of challenges in realizing this vision. This entry communicates this vision and the associated challenges that educators must address. The entry also provides a set of promising conceptual and pedagogic practices that can help educators confront the portrayed challenges.

In common language, a border can possess positive qualities such as providing helpful conceptual boundaries and asserting the parameters of legal sovereignty. In addition, from a conventional perspective, many borders appear to be ethically neutral, natural in their origin or fixed in their essence, such as one's sex, race, ethnicity, language, or intelligence. By contrast, the primary use of the term *border* within curriculum studies is pejorative, meant to convey dynamics of dominance and exclusion, inequality, and marginalization. Rather than seen as natural, predetermined, and/or unalterable, borders within a curriculum studies perspective are characteristically viewed as historically contingent, culturally constructed phenomena, perpetuated at the personal, social, and institutional levels in ways that are variously deliberate, habitual, and unconscious.

Curriculum educators committed to a holistic vision of democratic living seek to minimize, reconfigure, transcend, that is, to cross these borders for multiple salutary purposes: to disrupt and demystify stereotypes and enhance deep mutual understanding across differences; to expand bonds of community solidarity; to foster fuller, hybridized self-realization; to problematize prevailing, often unexamined relationships of power and hierarchy; and to institutionalize more enlightened commitments to social justice.

Obstacles to advancing this vision are ubiquitous and deep seated, multilayered, and intertwined. Biological forces often conspire to prioritize familiarity, predictability, equilibrium. Historical and systemic forces, involving sociocultural-political beliefs, attitudes, and rituals, congeal to normalize "us" and villainize the Other. Dominant derivatives of these forces can be fear and disgust, condescension and self-righteousness. In both symbolic and concrete ways, these intoxicating ingredients, often incensed by religious practices, tend to metastasize into an insistent demand for invasion and colonization, certainty and control, separation or stratification. These dynamics can overwhelm the realization of alternate, more democratic impulses toward curiosity and connection, accommodation and care. These latter dispositions are instrumental to a state of more peaceful, respectful, even flourishing coexistence within difference.

Animated by biology and religion, culture and politics, this quest for certainty and control, simultaneously universalizing and insulating, unavoidably collides with the irrepressible reality of three types of controversy that crisscross all these domains of life. These three types involve factual, definitional, and value disputes.

Representing disagreement over what has happened in the past or what will happen in the future, factual controversy highlights the inherent limitations of human knowledge and the essential unpredictability of various human (inter)actions. Given the stakes in terms of affirming or shaking one's personal identity, or influencing the distribution of power and tangible resources, individuals and groups are intensely concerned about how these factual disputes are resolved. A small sample of factual issues on which many citizens, policy makers, and private individuals hold tenaciously antagonistic viewpoints includes the creationist versus Darwinist conception of the origin of the universe; the effects of sex education practices on youth's responsible sexual behavior; the impact of selected governmental regulations on affordable, quality health care and the stable growth of the marketplace; the effects of bilingual or mainstreamed special education programs on the social and intellectual development of all students; the origin and mutability of one's sexual orientation; and the relative role of structural versus personal factors in perpetuating poverty.

Besides fencing in or out various perspectives over contested factual matters, people tend to build bunkers around their particular conceptions of selected terms, asserting and debating distinctions with life-and-death ferocity. Examples of such definitional disputes include conflict over the meaning of intelligence, patriotism, responsible sexual behavior, genocide, a true liberal or conservative, the nature of legitimate research, the line between rights and privileges, public responsibility and private discretion, and the moment when a fetus becomes a human being.

Reflecting various conceptions of the essential, the true, the good, and the right, people also construct fortresses and moats to elevate and separate themselves from competing values that threaten their customs and convictions. Throughout history both verbal and physical warfare have exploded between those who prioritize freedom over equality, national security over civil liberties, truth telling over loyalty to kin, reason over faith, and the subordination versus the equality of women, gays, people with disabilities, and people of color.

Border crossing educators seek to address not avoid the siege and flight mentalities associated with these forms of controversy and the persistent barriers to insightful communication and self-examination they can generate. With tact and tenacity, hope and humility, these educators confront border crossing challenges by taking on multiple, overlapping roles: critical theorist and Socratic seminar leader, public intellectual and policy advocate, conflict mediator and counselor, social science researcher and reflective practitioner. They expose learners to multiple cultures and the struggles and dreams these cultures commonly and uniquely experience. They model and offer conceptual tools to foster critical interrogation of the self and the complex conditions of possibility within which the self is continuously constructed. And they structure yin and yang processes of methodological believing and doubting, encouraging students to view controversial perspectives from both a generous spirit (“These ideas may have merit from which I can learn.”) and a skeptical one (“I need to question the veracity and ideological interests of all text’s premises and arguments.”).

Compelling in its cause yet daunting in its demands, the enterprise of border crossing

highlights the hopes and challenges for curriculum studies in a democracy.

## BOURDIEUIAN THOUGHT

---

Bourdieuian thought is a systematic and audacious approach in the sociology of education that has effected a set of suppositions that have influenced greatly the fields of education and curriculum studies. The French sociologist of education Pierre Bourdieu (1930–2002) developed his theories from an array of resources drawn from statistical analyses, structuralism, and the social theories of Karl Marx, Max Weber, and Émile Durkheim, setting forth a sustained and critical analysis of the role of schooling in reproducing class structures of domination and subordination. Through his analysis, Bourdieu contended that the educational system is extensively involved in the reproduction of social structure, and it ensures the perpetuation of privilege by the mere operation of its internal logic. The way social and cultural reproduction is effected through the symbolic power of the school has placed the sociology of the curriculum at the center. Bourdieuian thought and the concept of social capital addresses issues embedded within curriculum studies, education, and teaching, and it has generated many criticisms that are relevant to the field of curriculum studies. The examination of the structures of schooling, relationships among players

in education, and issues dealing with hidden curriculum, oppression in the curriculum, as well as who legitimizes knowledge to be taught at schools, who has access to it, and who participates in decision making are issues relevant to the fundamental curriculum questions. Based on sociological perspectives, educational inequality is embedded in the institutional practices connected to the transmission of curriculum, and in the principles of knowledge itself.

Bourdieu's central contribution has been the extension of the reproduction pattern beyond the boundaries of epiphenomenal economic-based superstructure models to analyze the internal logic of an educational system that, while concealing its role, simultaneously reproduces and legitimates the capitalist social formation, contributing to cultural and social reproduction. Bourdieu has articulated the argument that the dominant group, whose culture is embodied in the schools, controls the economic, social, and political resources of the capital of different subgroups. This capital is embodied in the habitus of subgroups, a system of durable, transposable dispositions that are the basis of structured, objectively unified practices, attributed by family, the educational system, and the force of social class. Economic capital refers to monetary assets that can be accumulated and invested as part of class strategy. Cultural capital refers to linguistic, stylistic, and knowledge attributes that are acquired from family through socialization as part of the habitus and that can enhance one's position in the cultural field. Social capital is the collective of actual or potential resources linked to possession of a durable network of essentially institutionalized relationships of mutual acquaintance and recognition. As per the Bourdieuan thought, the cultural capital the schools take for granted becomes an effective filter in the reproductive processes of a hierarchical society: Just as dominant economic institutions are structured to favor those who already possess economic capital, so educational institutions are structured to favor those who already possess cultural capital, defined according to the criteria of the dominant hegemony.

Bourdieu's theories include also notions such as the reproduction of structures, which is a system of objective relations that preexist the individuals and impart their relational properties to them.

Misrepresentation is a systematic and collective illusion of the class-based power networks that secure the permanence and stability of social structures. Permanence is also secured via the misrecognition of the arbitrary aspects of dominant cultures, usually taken as universal and legitimate, avoiding the real violence that lies behind. For example, the work of Bourdieu in the 1970s illustrates that educational systems foster a misrecognition of the part that schools play in cultural and social reproduction. Symbolic violence is the symbolic effect exerted by social power that never presents itself in its naked form as brute force.

Researchers and educational theorists in the mid-1970s through the mid-1980s, like Samuel Bowles and Herbert Gintis, Henry Giroux, and George Willis, have not only discussed the sorting functions of schooling, but also identified gaps in Bourdieu's model.

## **BROWN V. BOARD OF EDUCATION, BROWN I DECISION**

---

The landmark 1954 U.S. Supreme Court decision, *Brown v. Board of Education (Brown I)*, interpreted the equal protection of the laws clause of the Fourteenth Amendment of the U.S. Constitution, maintaining that separate was inherently unequal and overturning the 1896 *Plessy v. Ferguson* case that permitted segregation. The *Brown I* decision

actually represents the culmination of several court cases: *Briggs v. Elliot* (South Carolina, 1952), *Davis v. County School Board of Prince Edward County* (Virginia, 1952), *Belton v. Gebhart* and *Bulah v. Gebhart* (Delaware, 1952), *Bolling v. Sharpe* (District of Columbia, 1954), and *Brown v. Board of Education* (Kansas, 1954). All were later folded into the other cases when the National Association for the Advancement of Colored People (NAACP) encouraged the plaintiffs to turn them into school desegregation cases. This entry briefly introduces the context of the case and discusses current debates and additional aspects of the decision that are not often addressed. Finally, this entry focuses on the factors contributing to *Brown I*'s landmark status.

### Background

The primary referent for *Brown* is the 1896 Supreme Court decision, *Plessy v. Ferguson*. In this case Homer Plessy, a light-complexioned African American, tested the Louisiana segregation laws by riding a train car reserved for Whites. The law stated that segregation was legal as long as the facilities maintained for Blacks were equal to those established for Whites. Plessy argued his case on the basis of the Fourteenth Amendment, but the U.S. Supreme Court upheld the lower court Judge John Howard Ferguson's ruling and in doing so validated segregation throughout the nation.

As a consequence of *Plessy* separate and segregated facilities (schools, hospitals, drinking fountains, restrooms, bus and movie theater seating, etc.) continued to be prominent throughout the South in the United States. However, it was clear that these separate facilities were not equal, yet there was no enforcement of the equal aspect of the law. The family of Linda Brown sued the Topeka, Kansas, Board of Education because Linda had to walk past several schools (that enrolled only White students) to attend her all-Black elementary school, thus testing the separate-but-equal aspect of the *Plessy* decision.

### Current Debates

Current debates often focus on the motivation for *Brown*. Some argue that the nation was changing and that the Supreme Court's decision was part of

the natural evolution of race relations in the nation. This perspective suggests a more altruistic motive for changing the law and ultimately public policy. Others suggest that the proactive strategies of civil rights groups and citizens and the sheer volume of legal cases that was challenging segregation pushed the Court. However, some scholars such as Mary Dudziak suggest that the impetus for *Brown* was to facilitate foreign policy and to improve the international image of the United States in the midst of the cold war. Soviet propaganda was taking full advantage of the racial discord in the United States to appeal to nonaligned nations and to embarrass the United States as a hypocritical nation that offered freedom on the one hand and regularly denied it to Black citizens on the other.

Derrick Bell endorses Dudziak's thesis and calls the *Brown* decision a good example of interest convergence, where *Brown* assured U.S. Blacks that World War II and the struggle for equality and freedom abroad could be applied in the United States. Although many people think of *Brown* primarily as serving Black interests, the case also served White interests (e.g., improving the national image, quelling racial unrest, and stimulating the Southern economy). This convergence of interests is what made *Brown* possible and reflects the critical race theory assertion that all civil rights legislation is designed ultimately to benefit Whites. Ostensibly, the *Brown* decision was to be the open door of opportunity for Blacks and other people of color, but its benefits to Whites were considerable.

In 1989, Bell creatively used storytelling to relate "The Chronicle of the Sacrificed Black Children" to tell the mythical story of a community where all the Black students suddenly disappear on the day they are scheduled to be bused to a White community to attend school. Initially, the White community is elated. Their protests and angry demonstrations seem to have worked. The Black children were not coming. The Black parents became distraught and frightened because they could not find their children. After a few weeks of no Black children, many of the advantages the desegregation plan was to afford the White school begin to slip away. The bus drivers must be laid off because there are no children to bus. The buses themselves must be sold. The professional development leaders and school desegregation coordinators were let go. The extra cafeteria workers were laid off, the lunch

orders were reduced, and even the local merchants found themselves unable to move the extra inventory—candy, snacks, and comic books—they had ordered in anticipation of a larger school population when the Black children entered the school.

At the end of the chronicle, Bell depicts the White community members as so economically damaged that they begin hunting for the Black children themselves because they need them in order to garner the benefits that desegregation offers the White community. The story is a fantasy, but in the storytelling Bell reveals the multiple levels on which Whites gain through civil rights rulings. His point is not that Whites should not benefit, but rather that the primary focus of civil rights legislation in the United States is ultimately what it does for those in power and privilege rather than what it does for the dispossessed it purports to benefit.

### Additional Aspects

An aspect of *Brown* that has received scant attention is the sacrifices by so many African Americans. This is not to suggest that *Brown* was not a worthy goal, but rather to look carefully at the civil rights balance sheet and calculate what the decision cost the African American community. One tangible cost of *Brown* came in the loss of teaching and administrative jobs among Black teachers and principals. The estimates suggest there were 38,000 Black teaching and administrative jobs in 17 Southern states between 1954 and 1965. Although *Brown* defined the rights of Black students, it said nothing about Black teachers. In addition, some states enacted laws that allowed school boards to dismiss Black teachers without cause. In the 1965 to 1966 school year, the U.S. Department of Health, Education and Welfare reported that only 1.8% of the Black teachers in the 11 states of the former Confederacy taught on a desegregated faculty. There was not one Black teacher in Alabama, Louisiana, or Mississippi teaching in a school where there were White teachers. This occurred despite the fact that 85% of Black teachers in the nation were located in the South.

And perhaps the most bewildering aspect of *Brown* is that it was premised on the notion of Black inferiority. Even the plaintiff attorneys used this discourse to undergird its case. The strategy

of the plaintiff experts was to essentially pathologize Black children rather than address the underlying pathology—White supremacy. Thus, in order to gain access to quality education the plaintiff attorneys had to argue the inferiority of Black children (and by extension Black people) rather than attack the problem of inferior facilities and inferior education. The implementation of the ruling became one of moving Black children near White children regardless of the quality of the school and its teachers.

### Landmark Status

*Brown* gained its landmark status because of the sweeping changes it signaled for the use of and access to public schools as well as for other public accommodation. At this point in U.S. society, race relations were primarily a function of state laws and customs. Soon after Reconstruction, Southern states codified their beliefs about race, preventing Blacks and others from voting, attending state sponsored K–12 or postsecondary schooling, and using the same public accommodations as Whites such as bus depots, buses, drinking water fountains, and restrooms. *Brown*, though flawed, was the first step in easing these barriers. The case would be reviewed by the U.S. Supreme Court in 1955 in what became known as *Brown II*.

## **BROWN V. BOARD OF EDUCATION, BROWN II DECISION**

---

In 1954, the U.S. Supreme Court ruled in the *Brown v. Board of Education* decision (*Brown I*) that separate schools for White and Black children were inherently unequal. This landmark court decision, interpreting the equal protection of the laws clause of the Fourteenth Amendment of the U.S. Constitution, called for the end of racial discrimination in education; however, the means to achieve the integration of schools were not specified. The Supreme Court decided in 1955 to solicit arguments from the Attorney General of the United States and the Attorneys General of all states requiring or permitting racial discrimination in public education. The parties presented their views on the question of how they might implement the decree and included, in addition to the U.S. Attorney General, the states of Arkansas, Florida, Maryland, North Carolina, Oklahoma, and Texas.

According to Chief Justice Earl Warren, who issued the opinion for the Court, the presentations from the states were informative and helpful as the Court ascertained the complexities that would arise during the transition to an educational system free of racial discrimination. The Court believed that the implementation of the *Brown I* decision would require a variety of strategies depending on the local school district and that decisions as to how well a district complied with the original order should be remanded to the local courts for judicial appraisal.

In *Brown II*, its 1955 decision to delegate the task of carrying out school desegregation to district courts so that desegregation could occur with all deliberate speed, the Supreme Court set an ambiguous standard by which states and school districts could engage in endless delaying tactics. Indeed, many states and school districts interpreted this decision as legal justification for delaying, resisting, and avoiding school integration for many years.

In the case of Prince Edward County, Virginia, one of the five original cases that constituted the 1954 *Brown* decision, the school district failed to move on the original order. In 1959, when another court case ruled that the county's schools had to desegregate, the county board of supervisors stopped providing funding for the public schools and as a result Prince Edward County schools were closed for 5 years. Although Black children had no schooling options in the county, the county provided assistance for Whites to attend White-only private academies where their former public school teachers were teaching.

A related event during the initial *Brown* decision was that President Dwight Eisenhower wrote a longtime friend, Navy Captain Swede Hazlett in the fall of 1954 mentioning that he thought the issue of segregation would either intensify or lessen depending on the *Brown II* ruling that, he assumed, would be very moderate and ultimately relegated to the local courts. Eisenhower believed that the overwhelming sentiment toward state's rights would mitigate any aggressive attempt to enforce the *Brown I* decision. Thus, on one level he could be heralded on the international scene as presiding over a nation that had stood up for the rights of its Black citizens while remaining a friend of Southern constituents (or at least giving them a way to remain entrenched in their segregated school policies). It has been noted that Eisenhower was not happy about the 1954 decision, but felt duty-bound to accept it as the law of the land, having sworn to uphold the constitutional process. Further, liberals and conservatives alike contested the all-deliberate-speed language of *Brown II*. Those who defended the Warren court argued that they had no choice but to move slowly and cautiously so that schools might be permitted to work out the practical problems of redistricting, reassigning teachers and students, and constructing new bus routes. They also argued both then and later that great social changes take place gradually and that the Court was being realistic by applying the all-deliberate-speed standard. The empirical evidence suggests that all deliberate speed resulted in little or no change in school desegregation. In most instances school desegregation proceeded only when the court intervened in specific districts.

## BUSING AND CURRICULUM: CASE LAW

---

Busing policies and the associated case law have shaped our understanding of the role race may play in assigning or admitting students to schools. The legal framework that emerged from busing litigation is particularly salient for curriculum studies as it relates to race-based admission protocols for schools with specialized academic emphasis. Where de jure segregation remains in a school system the courts have offered wide latitude for school boards to maintain forced busing programs, among other measures, to reverse the course of historical discrimination. However, absent de jure segregation, the courts have limited the schools' ability to establish admission and assignment policies based on race.

The first forced busing programs were designed to enforce desegregation policies in compliance with *Brown v. Board of Education* (1954) and *Brown II* (1955). In the wake of the *Brown* decisions a body of case law emerged at the district and appellate levels that distinguished between de jure and de facto segregation. The lower court interpretations held that schools experiencing de facto segregation were not required to overcome the lack of racial balance that was an inherent consequence of segregated housing patterns. Schools with evidence of de jure segregation, however, were compelled to enact policies (e.g., busing) to eliminate the vestiges of past discrimination.

In 1968, the U.S. Supreme Court reviewed a student assignment plan that allowed free choice between two schools in the New Kent County (Virginia) School District. New Kent was a racially

mixed community with a history of de jure school segregation. The school system supported busing across the district for students choosing to transfer between the traditionally all-White New Kent School and all-Black Watkins School. The High Court ruled that the plan was ineffectual in facilitating a transition to a unitary system in that not one White student had elected to transfer to the all-Black school in the 3-year history of the program. The court opined that the district board had simply transferred the burden of integration from the school board (as was required by *Brown II*) to the parents of children in the district. In addition to finding that choice busing programs were unconstitutional if they failed to result in an integrated school system, the court proposed a set of six factors to consider when determining whether a school had reached unitary status. The six factors are student assignment, faculty, staff, transportation, extracurricular activities, and facilities.

The *Swann v. Mecklenburg* case of 1971 was the most significant early case addressing forced busing programs. The court considered a North Carolina statute that was known as the Anti-Busing Law N.C.Gen.Stat. § 115–176.1 (Supp. 1969) read, “No student shall be assigned or compelled to attend any school on account of race, creed, color or national origin, or for the purpose of creating a balance or ratio of race, religion or national origins. Involuntary busing of students in contravention of this article is prohibited, and public funds shall not be used for any such busing.” The court ruled that the Anti-Busing Law significantly hampered the district’s ability to remedy the segregation problem. If race must be considered when evaluating whether a school system is in violation of desegregation mandates, then the court offered that race would in all likelihood be a necessary consideration when crafting a remedy. As for the use of busing to desegregate schools, the opinion in *Swann* stated that “bus transportation has long been an integral part of all public educational systems, and it is unlikely that a truly effective remedy could be devised without continued reliance upon it.” Three years after *Swann* in *Milliken v. Bradley* (1974), the Supreme Court refined its position on racial balance policies by ruling that a federal court could not require a multi district busing remedy to address a single district’s de jure segregation.

Since the early 1970s, the case law with the greatest impact on busing practices has not dealt directly with busing policies. Several cases have addressed the role of race in student assignment and admission to programs of choice (both competitive and open). Most notably, *Regents of the University of California v. Bakke* (1978) and *Gratz v. Bollinger* (2003) rejected the use of racial quotas in student admissions, but retained the constitutionality of using race as a factor in admission decisions. Although many of the race-based admissions decisions were in a higher education setting, these cases became more important for K–12 schools as school choice became more prevalent, particularly in urban settings. In *Parents Involved in Community Schools v. Seattle School District No. 1* (2007), the Supreme Court struck down a district policy that used race as a factor in school assignment.

Although the Seattle case was not a busing case, the case law that emerged from it has significant implications for the legal fate of race-based busing programs. The Seattle schools operated a school choice system and classified students as either White or non-White for the purpose of using that classification as a tiebreaker in assigning students to a school. The Court ruled that the Seattle policy was unconstitutional because the racial balance sought by the district did not serve a compelling state interest and the policy they used to achieve greater student diversity was not narrowly tailored. Important to note is that the Seattle system was never found to operate as a de jure segregated school district. Absent a court order to desegregate, according to *Seattle*, school districts do not have the latitude afforded them by the *Swann* court to implement race-based student assignment policies. Moreover, any racially based student assignment pattern, including a busing program, can be implemented only if workable race-neutral alternatives have been considered.

## BUTLERIAN THOUGHT

---

Butlerian thought refers to the work of poststructuralist and queer theorist Judith Butler (1956– ). In curriculum studies, her theorizing is used to deconstruct binary concepts of gender, reconceptualize identity as nonunitary, and posit an ethics based on the limits of self-knowledge. Her most influential book, *Gender Trouble: Feminism and the Subversion of Identity*, critiqued the work of feminists who asserted woman as constituting a category with common interests and traits that reified an essentialist notion of gender. In de-essentializing gender, Butler conceptualizes identity as free-floating, as not connected to an essence, but instead to performance. In some of her later works, *Bodies That Matter: On the Discursive Limits of Sex*, *The Psychic Life of Power: Theories of Subjugation*, *Excitable Speech*, and most recently *Antigone's Claim: Kinship Between Life and Death*, published in 2000, Butler examines the implications of a nonessentialized notion of identity for theorizing subjectivity, power, and ethics.

For Butler, subjectivity is constructed through historical and anthropological positions that understand gender as a relation among socially constituted subjects in specifiable contexts. Gender is not a fixed category, but is fluid and shifting, changing in different contexts and times. Drawing on Michel Foucault, Butler argues that gender is flexible and not caused by stable factors. There is not a gender identity behind expressions of gender. Gender, in other words, is a performance; it is what one does, rather than what one is. Subjectivity is not the result of an authentic inner core self, but is the dramatic effect of performance.

The issue of power and agency is central to Butler's work. A central goal of feminism has been social change to improve the specific life circumstances of women. However, when woman as a category no longer exists, what becomes of political resistance? When subjectivity is no longer unitary

and fixed, what becomes of agency? How is power reinterpreted and understood without a subject? In her examination of censorship of hate speech in *Excitable Speech*, Butler disrupts the myth of the independent subject who holds power. Instead, she posits a notion of power as embedded in language and discourse. The discourse of censorship in this case functions ironically to construct power as constitutive of the state that subsequently subverts the positioning of the “I” that draws on agency in opposition to the state. Butler thus questions the very possibility of any genuine oppositional discourse. For Butler, subjects no longer have power but are produced in the very relations of power that they seek to oppose. Gender is consequently an effect of power that functions as a truth.

In *Giving an Account of Oneself*, published in 2005, Butler develops an ethics based on the rejection of a Western notion of the unitary self that no longer has a referential “I.” Drawing on Foucault, Friedrich Nietzsche, and Emmanuel Levinas, Butler examines what becomes of ethics when the subject is understood as being in a continual state of flux and constituted in relation to the social. Given that our self knowledge is limited, the concept of responsibility is one of acknowledging that we can never know ourselves except in relation to the social world. Consequently, social critique is at the core of ethical practice.

The theorizing of Butler has been taken up by curriculum theorists (Janet Miller, William Pinar, Debra Britzman) in order to deconstruct the ways in which identity, difference, and power are implicated in the construction of modernist notions of teaching, pedagogy, and curriculum. In curriculum studies, Butler’s theorizing has been engaged to deconstruct the binary ways in which education has been constructed as male–female, teacher–student, curriculum–pedagogy, and teaching–learning. Drawing on Butler, Miller critiques dominant conceptions of curriculum as a product. Embracing the notion of working the tensions, Miller highlights curriculum as a process that is continually constructed and negotiated in complex ways in the lived experiences of educators.

## CANADIAN ASSOCIATION FOR CURRICULUM STUDIES

---

The Canadian Association for Curriculum Studies (CACS) is a constituent association of the Canadian Society for the Study of Education (CSSE). The mission of CACS is to support discussions of curricula that are of interest to Canadian educators. Curriculum is broadly understood to mean any complex structure(s) that supports learning and teaching.

Although CACS is concerned with curriculum in general, the association has a particular interest in several areas as defined by the following five special interest groups: (1) Arts Researchers and Teachers Society, (2) Canadian Critical Pedagogy Association, (3) Science Education Research Group, (4) Language and Literacy Researchers of Canada, and (5) Francophone Group for the Study of Education in a Minority Context.

CACS is a constituent association of the CSSE along with 10 other associations and one graduate student committee. In turn, the CSSE is a constituent organization of the Canadian Federation for the Humanities and Social Sciences (CFHSS), a group that brings together over 66 scholarly associations and 73 universities and colleges, representing more than 50,000 scholars, graduate students, and practitioners from across Canada. The federation supports the advancement of research in the humanities and social sciences, and CSSE is one of a very small number of large associations within the organization. The CFHSS

offers its member organizations a range of programs. For instance the CFHSS hosts the single largest annual multidisciplinary gathering of scholars in North America (approximately 9,000) and administers a series of research seminars on Parliament Hill (federal government). But perhaps more importantly, the CFHSS acts as a representative to the federal government on matters relating to research in the humanities and social sciences. This means that CSSE, and thus its constituent associations (including CACS), has a voice on Parliament Hill as well.

In recent years, CACS has sponsored a biannual mid-year conference called *Provoking Curriculum*. In addition to this, CACS has typically sponsored a 1-day preconference before the 4-day CSSE congress (in which CACS is the largest constituent group offering sessions). The online *Journal of the Canadian Association for Curriculum Studies* is well regarded in the field.

CACS presents awards each year: two PhD dissertations awards, two master's theses awards, an outstanding publication in Canadian curriculum studies award, Ray Ryan Statistics Canada Prize for Curriculum Studies, and finally, a Ted T. Aoki Award for Distinguished Service in Canadian Curriculum Studies.

CACS is also affiliated with the International Association for the Advancement of Curriculum Studies and through CSSE provides an occasional research session at the American Educational Research Association annual conference.

## CANON PROJECT OF AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF CURRICULUM STUDIES

---

To strengthen the disciplinarity of U.S. curriculum studies, in 2007 the general membership of the American Association for the Advancement of Curriculum Studies voted to establish a Canon Project to suggest the main ideas, texts, and scholars in the historical formation of U.S. curriculum studies. To know a discipline obligates one to acknowledge the already existing conversation in which one is presuming to participate. Acknowledging the discipline-specific historical context in which academic knowledge becomes intelligible is one marker of disciplinarity. Through the discipline of the disciplinarity, one contributes to the field's intellectual advancement.

Concepts have histories that require elaboration if present usage is to have disciplinary resonance. For example, learning is a concept thoroughly discredited by Dwayne Huebner, a curriculum theorist whose seminal scholarship was conducted during the 1960s. Huebner showed that educational psychology was overidentified with academic psychology (and during his period, with behaviorism), thereby effacing questions of politics and culture. Huebner argued that other intellectual traditions must be employed in order to advance our understanding of educational experience.

Skepticism toward disciplinarity is, however, engraved in U.S. curriculum studies, aggravated by progressive education's efforts to reconfigure the school curriculum as child centered and focused on social reconstruction. Skepticism toward disciplinarity had also been affirmed by social efficiency advocates' ascription to adult activity the organizer of school curriculum. In later synopses of possible designs of the school curriculum, the academic disciplines represented only one of five possibilities. Add to these historical dispositions the contemporary preference for interdisciplinary studies and resistance to creating a canon for curriculum studies is predictable.

Verticality and horizontality structure the disciplinarity of curriculum studies, concepts replacing Joseph Schwab's syntactical and substantive structures. Focused on methodology and the concepts research methods generate, Schwab's schema is more appropriate to the natural and social and behavioral sciences than it is to the humanities and the arts that inform contemporary curriculum studies. The cultivation of verticality and horizontality supports—but does not guarantee—the field's intellectual advancement. Without knowledge of the intellectual history of curriculum studies, without understanding of its past and present circumstances (both internal and external to the field), one cannot contribute to the field. One cannot advance its conversation and thereby complicate its understanding. Nor without such knowledge can one claim expertise. The key curriculum question in the United States—what knowledge is of most worth?—is the uniquely vocational call of curriculum studies. The Canon Project of the American Association for the Advancement of Curriculum Studies is dedicated to providing an answer.

## CARDINAL PRINCIPLES OF SECONDARY EDUCATION

---

The 1918 report by the National Education Association's Commission on the Reorganization of Secondary Education (CRSE) was published as a bulletin by the U.S. Bureau of Education and titled *Cardinal Principles of Secondary Education*. The CRSE's seven main objectives have become a classic statement of curriculum aims. In light of an analysis of the typical adult activities of a citizen in a democracy, the *Cardinal Principles of Secondary Education* identified seven principal objectives of education: (1) health, (2) command of fundamental processes, (3) worthy home membership, (4) vocation, (5) citizenship, (6) worthy use of leisure, and (7) ethical character. The CRSE maintained that all subjects at all levels of education should contribute as appropriate to the achievement of each of these seven objectives for all students. The *Cardinal Principles of Secondary Education* suggested ways that high school subjects could achieve these objectives and intended for the objectives to unify an otherwise fragmented secondary curriculum.

Over time, the CRSE's seven objectives of education became conflated with the title of its report. Why this happened remains unclear. Perhaps the perception that the CRSE's seven objectives elaborated and clarified Herbert Spencer's well-known classification of five areas of life activities—direct self-preservation, indirect self-preservation, parenthood, citizenship, refinements of life—lent the seven objectives their appeal to educators. Historians also have tended to focus on the seven objectives, homing in on them as a manifestation of social efficiency–social control ideology and as part of a wider trend to deemphasize the traditional academic subjects in

the secondary curriculum. The CRSE's recommendations, however, were a far cry from contemporary social efficiency–social control proposals, and the *Cardinal Principles of Secondary Education* endorsed the traditional academic subjects. In any event, to this day, some curriculum textbooks continue to use the term cardinal principles of education or even seven cardinal principles of education to refer to the CRSE's seven objectives.

What is clear is that the preoccupation with the seven objectives has distracted readers from the other 18 principles of secondary education presented in the 1918 report. These principles addressed matters such as the goal of education in a democracy, education as a process of growth, the division of education into elementary and secondary, the articulation of higher education with secondary education, the specializing and unifying functions of secondary education, the comprehensive high school as the standard secondary school, and secondary education as essential for all youth. Taken together, these principles represent the blueprint for the U.S. comprehensive high school.

The *Cardinal Principles of Secondary Education* represents the efforts of progressive educators to respond to emerging conditions in school and society. By calling for greater participation in culture of all youth through secondary education, for the application of new educational research and theory to educational practice, for differentiation of curriculum and instruction according to student needs and interests, and for the expansion of the secondary curriculum to include academic and vocational education, the cardinal principles sought to accommodate the expanding secondary school population. As such, these principles can be viewed as a quintessential manifestation of progressivism in education. The *Cardinal Principles of Secondary Education* also had a profound influence on curriculum reforms through the middle of the 20th century. As such, the significance of the 18 cardinal principles of secondary education proposed by the CRSE is much greater than its identification of seven main objectives of education.

## CAREER EDUCATION CURRICULUM

---

Career education—preparing students with the skills to earn a living—did not come out of nowhere; it had its precursors. The first and maybe the most important of these was accountability. Performance contracting was one of the ways that accountability could operate. Performance contracting guaranteed that schools would achieve specific, measurable results within a specific time period at specific costs for a specific purpose. In other words, the schools would deliver on their promises. The process called for a school district to enter into a contract with an outside firm or teachers' group to accelerate the skill development of a limited number of educationally deficient youths, usually in such curriculum areas as mathematics or reading. Reimbursement to the contractor was based on the actual performance of students as measured by standardized achievement tests or by criterion-referenced and performance-based tests. When the period of the contract ended, the contractor turned over to the school system, the instructional program, and the learning systems that had been designed, packaged, and successfully demonstrated. The school system could then continue with the program. The program, often referred to as the curriculum or program of study, would become the essence or heart of the career area being developed.

It was against this backdrop that career education came into being. The chairman of the General Subcommittee on Education in the U.S. House of Representatives in 1970, Roman Pucinski, believed that the schools of the day had one final chance to prove their worth to the nation by dedicating

themselves to the preparation of students for the world of work. This was the vision of education for the 1970s.

Career education became a tidal wave in U.S. schooling. Nowhere in the history of education had a movement surfaced, spread as quickly, and had such far-reaching effects in such a short time as has career education. As the 1970s progressed, career education enlisted an impressive array of professional and civic associations as official supporters. Among these were the National Education Association, the Council of Chief State School Officers, and the National Association of Secondary School Principals to name a few.

Career education was held out as the remedy for the then dismal state of affairs. It constituted a systematic attempt to integrate the school's curriculum for all students at all levels of the public schools. Career education was to help rectify the increasing numbers of dropouts. Educators were now called on to begin the mammoth, but indispensable, work of reform. The cause of career education was advanced by the efforts of Sidney Marland Jr., U.S. Commissioner of Education in 1970. In fact, career education became widely known as his pet project. Marland maintained that career education would be a part of the curriculum for all students, would encompass a student's entire academic career, and would ensure that every student leaving school, whenever that occurred, would possess the skills necessary to earn a livelihood. Few schools could afford not to make the switch to career education, Marland argued, because of the deplorable, wasteful record of general education that prepared the young neither for a job nor for further education. Marland pledged a major part of the Office of Education's discretionary funds to career education.

Career education, with its motto of "All Students, All Occupations, All Subjects," surely stood as the epitome of an educational panacea. And Sidney Marland's role in this chapter in the history of reform qualifies him as the savior of U.S. education. But despite the optimism, career education was destined to fade, as other proposed panaceas had faded before it, only to reappear in the altered form of school-to-work initiatives some two decades later.

In general, most career education programs had in the beginning three main thrusts: basic business

education, office skills, and distributive education. The first, although often offered in combination with the other two, was less skills oriented. It was the program most often pursued by those desiring to study business at the university level. It was also aimed at meeting many general education functions of the secondary school. The second and third thrusts were more skills oriented; the intent was for the student to gain job-entry-level competencies.

The climate of society of the 1970s and 1980s exerted a tremendous pressure on school curricula. This phenomenon was well illustrated by the pressures on career education. There was pressure on career education to provide a better understanding of capitalism and business practices for all secondary school youth and not just for those pursuing specific business vocational skills. Simultaneously, there was criticism of career education for presenting an overly favorable picture of business practices.

Adding to this dilemma was another set of dichotomous demands. On the one hand, well-meaning business people saw career education's mission as providing a ready-made workforce, one that was literate, knowledgeable, obedient, and skilled for entry-level employment. Yet on the other hand, many educators argue that career education should foster individuality and place the student (individual) far above the demands of business people. Thus career education often faced an identity crisis. What should be the best loyalty of a career educator?

Historically, the workplace has been viewed as the end result of learning rather than seeing it as a learning opportunity in itself. The school-to-work legislation of the 1990s challenged the old assumptions by changing the perceptions of the workplace. It is now viewed as a place where education could be reinforced while at the same time providing a framework for the choices students would be making for their own futures. The current economy, the large number of retirees from the workplace, and rapid workplace changes due to technology all contributed to the openness gained at the close of the 20th century. The school-to-work programs of today have employers who now understand and promote the concept of learning rather than training. The key to continued gains remains with the requirement that local partnerships move responsibility from schools alone to

community-wide efforts, with specific roles and responsibilities outlined for each stakeholder.

## CAREER EDUCATION CURRICULUM, HISTORY OF

---

Differing conceptions of desirable goals for secondary education persisted during the 1960s and into the 1970s. A differing conception of goals for secondary education curricular studies was characteristic of the back-to-basics advocates of the 1970s. They saw the goals of schools as teaching the three R's supplemented by formal teaching of separate subject matter content. Their views often reflected their predecessors', who conceived of secondary education as a vehicle for meeting college entrance requirements. Another major group of critics of education during this period focused on the high school in particular and advocated a marked increase in the use of the community in secondary education. The committees and commissions that supported reforms of secondary education in the mid-1970s stressed community-conscious schooling, new transitions to adulthood, and less time on academic instruction. The sponsors reflected earlier emphases on vocational

curriculum and community participation. Their emphasis on the socially useful was similar to that fostered by the U.S. Office of Education during the 1970s—career education. Sidney P. Marland, former U.S. Commissioner of Education, pointed out that career education has had a long and honorable ancestry, dating back to Benjamin Franklin's advocacy of more useful education. Career education advocates urged that schools' curricula orient and equip young people to earn a living in a personally significant and satisfying career field. However, they contended that more than vocational education was needed; career education should be an integral part of general curricular study by young people in all courses throughout both elementary and secondary school years.

Career education has become one of the most diversified program areas in the secondary school. Often referred to today as career pathways, a quick glance at the program areas of concentration under the career education rubric of a secondary school illustrates that diversity: agriculture; architecture, construction, communications, and transportation; business and computer science; culinary arts; education; engineering and technology; family and consumer sciences; healthcare science; marketing, sales, and service. Under each of these program areas exists a number of varied courses.

In 1974, career education received its first official federal dollars, as part of the Elementary and Secondary Education Act Amendments. Even though the allocations were not earmarked for program implementation, approximately \$40 million was spent supporting career education initiatives at over 400 sites throughout the country. The U.S. Office of Education had finally made career education a priority. In 1976, another focus on career education with a number of guided research studies laid the groundwork for today's school-to-work planning.

Although career education was a curriculum model originally proposed for the total school program, it has been more widely accepted by vocationally oriented subject areas. Within career education, two of the four career education models developed by the U.S. Office of Education have been used. These are the school-based model developed at the Center for Vocational and Technical Education at the Ohio State University and the employer-based model developed jointly

by the Far West Laboratory for Educational Research and Development in San Francisco.

In the school-based model, there are eight areas of educational experience that form the basic conceptual elements of career education: career awareness, self-awareness, appreciations and attitudes, decision-making skills, economic awareness, beginning competency, employability skills, and educational awareness. These eight elements were then translated to eight educational outcomes. Primary among these were career identity, self-identity, employment skills, and career placement. Career educators have used this model in their attempts to blend together student pressures for self-fulfillment and business's demand for a skilled workforce. The model lends itself both to the general education function and to the preparation of students for postsecondary schooling.

The second model frequently used is the employer-based model, which emphasizes year-round operation and open entrance and exit by students. In this model, a student may learn job entry skills for a secretarial position then exit to work as a secretary. For instance, assume the new secretary goes to work with a local lawyer who is participating in the program. After a period of time, the student decides that being a law clerk would be more rewarding. He or she reenters the program to gain those skills and then rejoins the lawyer as a law clerk. As can be seen, this model offers endless opportunity for training, exploration, and retraining. To some extent, this is the model often used for distributive education programs.

A third model is known as the residential-based model. This model was designed to rehabilitate whole families, not merely the individual breadwinner. A prescription for a whole family is given that could include such things as counseling, recreation, home services for the family, or vocational preparation. Employment on completion of a residency was to be guaranteed, and assistance with job searches was to be provided.

The final model is the home-based model. The inspiration for this home-based model was *Sesame Street*, a successful, long-running educational television series for children. An attempt to develop and coordinate learning systems to reach certain home-based populations caught between formal education and work, the home-based model was never fully operable.

All four of these models were practical inventions based on existing ideas and examples, not research. It became apparent that the school-based model did not have in place the necessary changes in curriculum, school environments, teacher counselor training, and infrastructures. The employer-based model found that industry and business were not geared to provide high volumes of academic training and were not yet predisposed to do so. The residential model became a cumbersome and expensive model with few proven effects and questionable objectives. The home-based model did not produce its goals, primarily due to underfunding and lack of existing mediated instruction.

Historically, the workplace has been viewed as the end result for learning rather than seeing it as a learning opportunity in itself. School-to-work legislation and activities challenge the old assumptions by changing our perceptions of the workplace. It is now viewed as a place where education can be reinforced while at the same time providing a framework for the choices our children make for their futures.

cognitive and moral dimensions of the curriculum. Although the term *care* has sources in ancient literature, mythology, and philosophy, recent attention to the notion of care increased significantly after the publication of Carol Gilligan's groundbreaking work, *In a Different Voice: Psychological Theory and Women's Development*. Gilligan's thesis that there are two different moral voices—one of impartiality or justice and one of relationships and care—fueled further work on what variously became known as caring, a care perspective, or an ethics of care. These discourses were further elucidated and vigorously debated in a variety of locations including bioethics, women's studies, psychology, education, and curriculum studies.

Nel Noddings's *Caring: A Feminine Approach to Ethics and Moral Development* was one of the most important works to follow Gilligan. Like Gilligan, Noddings makes distinctions between thinking guided by rules and principles and thinking guided by relationships. The former, what Noddings refers to as the approach of the father, is grounded in abstraction, away from complicating factors; the latter approach of the mother is grounded in those very complicating factors such as context, feelings, and personal histories. These approaches relate, then, to the distinction between acting on the basis of reason and acting on the basis of feeling. Indeed, all caring, be it that of parents, nurses, or teachers, entails what Noddings calls engrossment and motivational displacement. The former involves a deep-seated receptivity and responsiveness to others; the latter involves putting oneself at the service of the other, an approach that has significant implications to teaching and the learning environment. Arising in part from the phenomenological tradition, Noddings's theorizing has naturally found a warm reception in the fields of nursing and education. It has, however, received criticism by some feminists who argue that her conception of caring reinforces traditional female roles of giving and neglect of the self—Noddings's theorizing is infused with the language and experience of the mother—and thus may lead to or sustain unequal relationships between the caregiver and the one receiving care.

Noddings believes that the principal goal of education is to produce caring and competent persons. In *The Challenge to Care in Schools: An Alternative Approach to Education*, one of her most significant

---

## CARING, CONCEPT OF

---

A caring perspective in the curriculum recognizes that learning is most likely to develop in students who feel cared for and takes into account both the

contributions to curriculum theory, Noddings argues for a curriculum design that begins with a belief in multiple intelligences, similar to those proposed by Howard Gardner, and the unique talents, abilities, and interests of each child, similar to the goals of what she refers to as progressive education. Such a curriculum eschews a traditional design emphasis on academic disciplines in favor of a curriculum to be organized around centers and themes of care. These include caring for self; caring in the inner circle (for family and friends); caring for strangers and distant others; caring for animals, plants, and the earth; caring for the human-made world; and caring for ideas. A curriculum so designed is by definition interdisciplinary; it also releases traditional conceptions of the educated person as one who has merely mastered the academic disciplines separate from their personal experiences, capacities, and interests.

William Pinar notes several others who have looked to the concept of care as the theoretical organizer for the curriculum. In particular, he cites George Willis's work on pedagogy and parenting and Robert Starratt's work on the critical role of care and concern in the curriculum. However, as Pinar argues, no scholar has looked to care in the curriculum more comprehensively than Noddings.

originally conceived to translate high school work into equivalencies for the purpose of college admission: Students earn one unit of high school credit upon completing 120 hours in one subject, accumulated in four or five meetings a week for 40 to 60 minutes for 36 to 40 weeks each year. Fourteen units constitute minimum high school preparation.

The early decades of the 20th century were a period of massive expansion of high school populations, creating a good deal of articulation about the mission of the high school and its curriculum and increasing numbers of applicants for postsecondary education. National standards for high school curriculum and college entrance requirements became necessary not only to help high schools adequately prepare their students for college-level work, but also to help colleges evaluate the increasingly large pool of applicants who had studied a wide range of high school curricula. In the 1890s, the National Education Association (NEA) appointed the Committee of Ten on Secondary School Studies, chaired by Charles Eliot of Harvard University, and the Committee on College Requirements to address these issues. Reports presented by these groups laid the foundation for standardizing high school curricula across the country. In 1894, the NEA indicated that every academic subject taught in a secondary school should be calibrated in course units based on contact hours and taught to the same extent to every student. Student learning was measured in terms of time spent in class on the standard curriculum. Thus, for all students who studied history, Latin, or algebra, for example, the allocation of time and the method of instruction were to be the same. The standard curriculum was provided to all students in spite of their individual educational desires or interests, and all academic subjects were to be regarded equally for admission to colleges and universities. The Carnegie Unit was designed to increase transferability of students and credits throughout the United States.

Although the Carnegie Foundation did not develop the idea of the unit, the foundation was instrumental in its widespread acceptance. When the foundation was established in 1906, Andrew Carnegie donated \$10 million to provide pensions for professors, announcing that any college failing to adhere to the definition set down by the Carnegie Foundation, in other words, requiring less than the usual 4 years of academic or high school preparation

---

## CARNEGIE UNIT

---

Developed in 1906, the Carnegie Unit measures the time a student has studied a subject in the U.S. secondary and postsecondary education system. It was

in addition to the preacademic or grammar school studies, would not receive retirement allowances for its professors. Because few colleges at the time had their own pension programs or annuity funds, the unit was quickly accepted in both colleges and high schools. By 1910, almost all high schools measured course work by the Carnegie Unit. Predictably, an increasing number of high schools followed the standardized unit, altering their curriculum and graduation requirements to ensure their students' admission into colleges and universities.

The Carnegie Unit has shaped major issues in U.S. secondary and postsecondary curricula and the conditions for federal-level funding, accreditation, and the accountability of educational institutions (e.g., the government requires institutions to maintain standard academic calendars built on credit or clock hours). The Carnegie Unit has continuously influenced the U.S. education system, coinciding with increasing enrollments for postsecondary education; a standardized curriculum that all students learn to a common standard; correlation of high school graduation requirements with college admission standards; pressure for public accountability, institutional efficiency, and productivity; student transfer and mobility; standardization of online and distance education; and attention to the standardized integrity of the overall curriculum.

## CASE STUDY RESEARCH

---

Case study research is a strategy used to investigate a bounded and particular unit of study (a

case) to understand its complexity and/or the broader context in which it is situated. Scholars variously refer to the case study as an approach to designing, collecting, and analyzing data; a choice concerning which phenomenon they investigate (the case); or as a product of analysis (the form in which they present findings). As a research strategy, the case study emerged in the United States in the early 20th century. It gathered renewed momentum in the 1960s among researchers eager for methodologies that could support in-depth examination of phenomena in their natural settings. Case studies utilize quantitative and/or qualitative data and multiple data sources to explain, explore, or describe phenomena. The cases researchers choose based on research purpose reflect significant conceptual diversity: individuals, groups, organizations, places, periods of time, relationships, events, or processes can all constitute cases. In contrast to research designs that require large samples, a single case is sufficient for a case study. Whether researchers design single or multicase studies, explore relationships among cases, or analyze cases to gain insight into broader phenomena, the basic building block of case study research is rigorous attention to the complexities of the specific case under study. The case study is a well-utilized strategy in social science fields, medicine, law, business, government, education, and evaluation. The concrete and applied nature of case study research makes it particularly useful for educational and curriculum researchers striving to evaluate programs, analyze specific curricula, and improve teaching practices. This entry describes the case study approach, discusses its application and use in education, and notes some of its challenges.

### Case Study Approach

A goal of case study research is thorough investigation of the case and its context. Cases are conceptual categories researchers delineate as worthwhile to explore in detail because of their specific qualities or their potential to illuminate a given phenomenon. A case can refer to a specific person (an administrator, a hiker, a babysitter), a period of time (a school semester or election day), an event or activity (a wedding, a basketball game, a natural disaster, a birthday party), a group or community

(skateboarders, homeschoolers, volunteers, members of a culture, breast cancer survivors, antiracist activists), processes (educational reform, curricular implementation, organizational change), or places and regions (a street corner, a village, a city), among others. Because the boundaries of cases are constructed and conceptual, cases must be defined clearly and can sometimes overlap, such as a school and a neighborhood or a birthday party and a group of kindergarteners. Also, multiple small cases can comprise a larger case. For example, schools (potential cases to study) can comprise a school district (a larger case) or individual students (potential cases) can comprise a classroom (a larger case). Researchers refer to cases with multiple units of analysis as embedded or layered studies.

Researchers designate particular units to study based on theoretical framework and research purpose. A case may pique their interest or display interesting features useful to examine in depth (intrinsic case), offer insights into a broader issue (instrumental case), represent an average phenomenon (typical case), provide information on a phenomenon about which little is known (revelatory case), or represent an unusual or striking example of a phenomenon (extreme case), among others reasons. Scholars sometimes use different terms for the same rationale; for example, extreme cases are also called deviant or unique. As an example of an extreme case, researchers interested in testing initiatives might select for study the only school in a given district with high test scores. In this case, the school is the focus, and the researcher might explore the school's history, context, demographics, testing patterns, curriculum, and any other features relevant to constructing a comprehensive portrait of that unique case. Case studies can be short term or longitudinal (investigated over time), exploratory or evaluative, or single or multiple. Researchers might use findings to extend theory, modify generalizations, or connect specific events to larger patterns. However, generalizing findings to other populations is not the intent. Rather, researchers aim to explore the phenomenon of interest in depth and detail in each defined case.

Researchers choose methods and data sources for their capacity to provide rich information about the phenomenon of interest. For example, an ethnographic case study intended to examine a

particular community in depth might use methods of participant observation and in-depth interviews whereas an evaluation case study intended to improve a program might rely on surveys and focus groups. Rigorous research depends on the use of multiple data sources appropriate to the study. Researchers may draw from statistical data, interviews, documents, field notes, films, photographs, and cultural artifacts to examine their case. A researcher studying a family might conduct observations at family reunions and soccer games and analyze such documents as scrapbooks, calendars, family portraits, and letters. A researcher studying an organization might collect statistics, e-mails, mission statements, and interviews. Other promising materials might surface during the course of study.

Researchers examine single or multiple cases based on their research purpose. Some favor multiple-case designs because they offer layered evidence. Researchers immersed in a single case study might choose, once they capture the complexity of that case, to examine additional cases, compare and contrast them, or compile them to analyze larger cases. For example, a researcher focusing on a shy student in a reading class might shift attention to several gregarious students and then to classroom dynamics as a whole. He or she may also choose to examine other classrooms to illuminate the cultural climate of a larger case, the school. In this approach, each case should be defined clearly and considered as a bounded and complete entity before examining additional cases.

Case study scholars advocate varied strategies for rigorous analysis (the process of meaning making) based on their research framework and purpose. Some link multiple frameworks and prescribed analytic models with the phenomenon of interest (a more positivist approach), and others focus analytic energy on understanding the unique and particular instances of a given case (a more interpretive approach). Analysis can begin at any stage of the research process: as the researcher ponders an unusual interaction in the field, jots questions and case notes, or recognizes common patterns and inconsistencies. Indeed, some approach data gathering with a general framework that directs their attention in the field and helps guide analysis. Depending on study purpose, sustained and formal analysis might include both inductive (themes

that emerge from the data) and deductive (a framework is applied to the data) analyses. Specific techniques include scrutinizing specific instances, searching for patterns, seeking exceptions to patterns, assessing frequencies, categorizing and synthesizing, cross-case pattern analysis, pattern matching, and data displays.

A necessary component of all analysis is organizing and condensing raw data—the transcriptions, archival records, documents—into a manageable format. The organizing process is not simply a mechanical one; sifting through data by hand or with computer software is a conceptual process that can uncover themes and relationships. As patterns and themes crystallize, the researcher translates findings into a case study narrative that conveys significant elements of the case to an intended audience. A common procedure to enhance study quality is to share the case report with participants to ensure the accuracy of findings. Although the final form of the report depends on the project purpose and audience, a quality case study should clarify case boundaries, provide supporting evidence, consider alternative perspectives, and engage the reader. It may include narrative vignettes or quotes to bring case elements to life. Indeed, the potential for audiences to connect with case events offers a unique form of validity.

### Use in Education

Educators have found the applied orientation of the case study particularly useful for examining student experiences, teacher practices, and educational programs in their specific contexts. In turn, case study findings (case reports) have been used to enhance teaching and learning for decades. For example, researchers have used case studies of curriculum implementation to inform teacher training. Teachers have conducted collaborative case studies to gather data in their own classrooms and to use it to improve practice. Case studies have been conducted on educational policy, curriculum history and implementation, special education, multicultural education, technology use, student perceptions of diversity, preservice teachers, student achievement, and at-risk students, to name a few. They have also been useful in program evaluation, cross-cultural research, and exploring the experiences of marginalized people.

### Challenges

Case study research can be challenging to conduct and analyze. Scholars' different definitions of the parameters, concepts, and goals of the case study lend some confusion to understanding and applying the strategy. Some consider researchers' pursuit of case studies haphazard and insufficiently rigorous, while others consider findings of limited use because however theoretically relevant or comprehensive, they cannot be generalized to other populations. Also, as is true of other research representations, the final case study report may present particular interpretations as if fixed and timeless rather as a dynamic phenomenon that continues to expand and shift beyond the researcher's limited presence in the field. Indeed, researchers' emphasis on what they see to be unique in a given case may undermine its complexity and present a partial view of what is going on. Researchers may also focus too readily on individuals with less power in educational systems, such as teachers and students, rather than on, for example, administrators and policy makers. Despite these reservations, many educators consider the case study an important strategy for informing teaching, learning, and policy processes.

## CHARTER SCHOOLS

---

Charter schools are public schools of choice, chosen by teachers, parents, and students. In these schools,

teachers and students have more influence on decisions that affect the teacher–learner interaction. Instead of being accountable for compliance to state or district rules and regulations, they are accountable for academic results outlined in their charter.

Charter schools became an integral part of the public school system in the United States when Minnesota enacted the first charter school legislation in 1991 and opened the first charter school in 1992. By 2008, 42 states and the District of Columbia had charter school legislation, and over 4,000 charter schools were in operation throughout the country, serving over one million students. States with the most charter schools are California, Arizona, Florida, Texas, and Michigan. The development of charter schools grew out of the alternative education movement of the 1960s and 1970s when public education was exploring a variety of ways to educate the increasing size and diversity of the school population. A significant call for reform during those two decades came from large city school systems, for example, in, New York, Chicago, Philadelphia, Cleveland, Los Angeles, Minneapolis, and St. Paul.

Ray Buddle, professor at the University of Massachusetts, Amherst, is often considered to be the father of the charter school movement. In 1975, Buddle suggested that groups of teachers be given charters by their local school districts to explore alternate and new approaches to teach students. In 1988, Buddle's book, *Education by Charter: Restructuring School Districts*, advocated empowering teachers to create innovative new programs that would meet the needs of the growing and diverse population of students enrolled in public schools. That same year, Albert Shanker, president of the American Federation of Teachers, called for reformation of public schools by establishing schools of choice or charter schools, which would provide teachers with the opportunities to develop more choices in public education.

The charter school concept was supported by both Democratic and Republican lawmakers. Democrats saw the development of charter schools as a means of providing more education choices for parents and students to improve the quality of education within the public school system. Republicans viewed charter schools as developing competition for quality education that would ultimately be market force driven. They believed that public

school funds should follow the students whether they attended public or private schools. With bipartisan support for the charter school concept, the number of charter schools quadrupled between 1996 and 1998.

Charter schools are public schools of choice financed by public funds, not vouchers for private schools; open to all students; distinct legal entities, operated by an array of nonprofit groups, governed by their own charter, not by public school rules and regulations; places where teachers and administrators have more decision-making authority than exists in traditional public schools; generally smaller than traditional schools, providing unique learning environments and alternative learning methods; communities using a wide variety of curriculum and instructional practices; and committed to improving public education.

In order for charter schools to succeed they have to meet three criteria: (1) proper state legislation, (2) an authorizing entity (this varies from state to state, but most often is a local or state school board, a university, or community college), and (3) people to run the school. The provisions in the various states' charter laws vary from very restrictive to very loose; however, the basis of the provisions is designed to ensure choice for parents and students, to provide quality educational opportunities for all students, to meet the needs of most students, to explore and implement innovative ideas about teaching and learning, and to develop a system of accountability that measures students' progress in understandable terms. Laws governing charter schools cover seven basic policies and legal areas: (1) charter development, which includes who may propose a school, how charters are granted, and the number of schools allowed; (2) school status—how the school is legally defined and related governing, operational, and legal issues; (3) fiscal—the level of anticipated funding from the state and other sources; (4) students—how schools are to address admissions, nondiscrimination policies, racial/ethnic balance, discipline policies, and access to special education; (5) staffing and labor relations—whether the school many act as an employer or will a management organization do so (e.g., Edison Schools), which labor relations laws apply, and a definition of staff rights and privileges; (6) instruction—the degree of control the school has over the development of instructional goals and

practices; and (7) accountability—whether the school follows a performance-based contract, how assessment methods are selected, and how the charter can be renewed or revoked.

Demographic characteristics of most charter schools are similar to those of traditional public schools; however, in many states, charter schools serve significantly higher percentages of minority or economically disadvantaged students than the traditional public schools and are more popular in urban areas than suburban areas. Charter schools are not allowed to charge tuition and are funded according to enrollment, usually at the same level as traditional public schools; some states reduce that funding by 10% to 20%. Charter schools are entitled to federal categorical funding for which their students are eligible, for example, Title I and special education funding. Federal legislation also provides grants to help charters with start-up costs as they do not receive capital funds for facilities.

Charter schools are, and likely will continue to be, an important public school entity, where experimentation can provide data and insight for future reforms of traditional public schools.

## CHILD-CENTERED CURRICULUM

---

Child-centered curriculum is a central and contested concept in curriculum studies. In implicit and explicit ways, examination of this term raises at least three fundamental curricular questions: What are the most desirable ends of education? What are the most effective means to these desirable ends? Who should influence and determine these decisions? These core curricular decisions remain subjects of continuing controversy into the 21st century.

Historically, the child-centered curriculum is most associated with John Dewey's progressive views on education and, particularly, with his critique of the disengaging, rote-minded methods schools typically employed in transmitting to youth a traditional subject matter composed of the classics, history, mathematics, and science. Rather than organizing learning around the separate subject disciplines and insisting that students adapt to this preset curriculum, Dewey recommended a more holistic, interdisciplinary, and developmental vision of education. In his experiential, inquiry-oriented approach, students' keen expressive impulses to investigate, construct, and understand their world would be prime centers of gravity that would both energize and ground the selective introduction of curricular concepts.

Many of Dewey's educational ideas were implemented and refined in his University of Chicago laboratory school. Through a curriculum that sought to unify the practical and the conceptual around robust organizing themes (e.g., social occupations, progress through inventions and discovery), students learned about math, architecture, and the manual arts through building miniature houses, looms, and garden tools. They studied industrial history through the process of weaving cloth. They learned botany through working in a garden. They enhanced their understanding of the culinary arts through planning and cooking meals. In these and related processes, they refined their powers of observation, inference, reflection, and documentation as well as their capacities for community service and democratic living through the cultivation of group building and conflict negotiation sensitivities.

The role of the teacher in this educational dynamic is demanding and multidimensional. In

collaboration with colleagues, teachers establish a curricular structure that is horizontally and vertically coordinated as well as psychologized to resonate with and stretch students' expressed interests and latent capacities. Teachers guide students through the interactive process of posing questions and designing engaging educative projects. Done well, this teacher guidance vitalizes a formerly sterile curriculum, makes curricular concepts more concretely available for students' understanding and meaningful application, enriches students' connection to their community, enhances their sense of efficacy and responsible citizenship, and animates their desire for further, more sophisticated experience. For Dewey, these dynamics reflect the artful integration of teacher-assisted, child-centered, subject-mattering curriculum designed to promote education as a process of continuous growth.

Given competing authoritarian and democratic conceptions of the purposes of education, the asymmetric dynamics of youthful development, the bureaucratic nature of schooling with its characteristically sluggish responsiveness to individuality, among other factors, implementing Dewey's views of an integrated curriculum is tangled with challenges. On the one hand, a Rousseauian deference to Rousseauian the inherent wisdom of youth can lead to adult nonintervention in the face of youth's potentially myopic and meandering pursuit of the immediate, the pleasurable, and the interesting. Frequently diminished if not discarded are the shaping role of history, the rigorous use of the mind, and the often arduous pursuit of the genuinely meaningful.

Throughout the 20th and current century, powerful forces from a countervailing direction have tended to undermine curricular integration, an emphasis on student interest, Rousseauian and the enactment of school-based democratic community. Largely authoritarian and narrowing in their curricular impact, these forces have included the business-based social efficiency movement, the specialization of knowledge, an atheoretical approach toward teachers' professional development, the rise of globalization and the competitive, nation at risk mentality it accentuates, and the current standards movement with its high-stakes testing emphasis.

Amidst these forces, proponents of Dewey have struggled to keep his vision alive. With varying emphases and mixed results, Dewey's ideals have influenced schools associated with the Eight Year

Study, the free school movement of the 1960s and 1970s, and progressive education programs such as the Coalition of Essential Schools, Foxfire, Just School Communities, and the Institute for Democracy in Education and Rethinking Schools. Brian Schultz's resourceful efforts in integrating his curriculum, his urban elementary students' voices, and state standards around a set of social action projects represent a compelling contemporary classroom example of Dewey-inspired practice.

## CIVIC EDUCATION CURRICULUM

---

Civic education is a social studies discipline that addresses the teaching of government, development of the citizen, and political and civic participation, but its themes resonate through the entirety of schools. Most school mission statements claim to develop good citizens. Perspectives from curriculum studies impact the responses to the fundamental questions that define this good citizen—what kind of citizen and a citizen of what—and organize this entry.

Civic education weaves its way into schools and arises as a unique subject because it is historically and politically accepted that the future of the nation rests upon an educated citizenry. A nation is not a clearly defined entity. Although lines exist on maps, the real meaning resides in the imagination of its citizens. Their shared imaginary defines the nation and the perpetuation of that imagination maintains it. As public entities, schools are central to

developing and sustaining that imagination. Civic education is typically relegated to government or civics classes. But the concept of citizen is reinforced through the organization of the school—behaviors expected of citizens are reproduced in rules and expectations of student participation in all curricular and noncurricular arenas. Some schools assess participation through citizenship grades. Although there is agreement about the importance of citizenship, there is debate over what it means to be a citizen, particularly in this global era.

A citizen is defined against its counterpart—a subject. Citizen arose to distinguish active participants in a democracy from the disempowered masses under a monarchy. These origins frame the common representation of citizen in U.S. curriculum today. This Kantian perspective purports that a citizen is someone who belongs to a country and upholds its political institutions. In order to uphold these institutions, it is essential that good citizens are personally responsible, have a common understanding of their country’s political history, understand their civic rights and responsibilities in relationship to the national government, and participate accordingly. The particular responsibilities emphasized in this literature are those that maintain the formal institutions of democratic governance such as voting, participating in community service, and acting politically through activities such as donating money, working on campaigns, and signing petitions. These forms of political participation are taught in government classes and reinforced through school elections and student councils.

A less common representation of the citizen is proposed by critical theorists who draw heavily from the civics education curriculum of the 1970s. They define democracy as a process that requires deliberation, not a product. Deliberation occurs through rich dialogue involving marginalized and empowered voices to decide what is best for the community. Deliberation entails difficult questions about how and why the community is organized as it is and who benefits from this arrangement. Although understanding institutions and structures is helpful to this dialogue, the approach shifts in emphasis from learning about the structures to developing the skills to engage with them. Teachers and curricula that privilege this form of citizenship have students actively participating in democratic structures, raising critical questions about the

functioning of these structures, and evaluating rather than accepting the core values of democracy. Critical theorists argue that good citizens do not merely uphold the image of the nation, but ask questions about why, how, and for whom that image exists.

Citizenship education currently faces the challenge of considering how students are prepared to participate in and define themselves in relationships, institutions, and systems that transcend the nation. There are two factions within political theory that theorize global citizenship. Transnationalism covers bodies of literature that focus either on institutions that transcend national boundaries or the experiences of people who reside in more than one country. In the global world, people and businesses move readily between nations. Institutions such as the International Court and World Trade Organization create policies that limit the power of a nation to act in the international community. Alliances such as the European Union offer citizenship in national and extranational communities. People migrate regularly, and as they move, they transfer citizenship experiences across national boundaries. The existence of transnational institutions challenges the centrality of the nation in citizenship affiliation. Participation in intersecting scales, overlapping institutions, and migration affects how people define and enact their citizenship in each of these spaces. In return, each of these spaces is forced to consider who is their citizenry and how those citizens should participate.

The rise of cosmopolitanism in contrast to transnationalism accompanies a worldview of interconnectedness between people. Although people may first identify with and interact with people in their communities, those communities are increasingly influenced by others through the migration of people and the transmission of ideas through goods and the media. The pervasive access to seemingly distant places and people means that the global and local are not unique entities. Local and global actions affect one another. Cosmopolitanism challenges citizens to look seriously at this interaction and purports that people have an obligation to others, others who are not directly related to them. This ethical view decenters the nation and institutions and challenges common definitions of participation. It emphasizes the demand for individual and collective deliberation about the common good—locally, nationally, and globally.

The work of deliberating between and about these forms of citizenship is a task for curriculum studies. The pervasiveness of the school in the formation of the citizen means that all of the conversations about identities and politics within and about curriculum theory impact the citizen that should arise from the curricular and educational experience.

## CLASS (SOCIAL-ECONOMIC) RESEARCH

---

Class refers to economic position based on income, wealth, or a combination, as well as social expressions of class membership. More fundamentally, class refers to structural relationships based on control over wealth and its production. Research on class in curriculum mainly asks the extent to which curriculum enables children and youth to transcend their family's class or conversely, the extent to which it helps to reproduce the existing class structure, including the position of most individuals within that structure. Surprisingly, little research directly investigates these questions, although there is considerable theory about them, rooted in quite different perspectives. The primary question asked about class and curriculum from a functionalist perspective is what is the relationship

between educational attainment, student family background, and class mobility. The primary question that is asked from a critical perspective is in what ways does curriculum contribute to the reproduction of the class structure and individuals' position within that structure. The primary question that is asked from an interpretive perspective is how do students from specific class backgrounds make sense of and respond to curriculum.

### Functionalism

Functionalism has long dominated thinking about education and curriculum. Talcott Parsons and Robert Merton were two significant developers of functionalism during the mid-20th century, but this theoretical orientation is widely held by many educationists and economic developers and members of the business community. From a functionalist perspective, schools contribute to the nation's economic development; to maximize this contribution, the structures of schooling and contents of curriculum should match needs of the economic and social system. For example, a well-known report based on functionalism was *A Nation at Risk*, published in 1983 by the National Commission on Excellence in Education, which claimed that the United States lags in international competition because schools fail to teach the skills needed by today's economy. Although functionalism views poverty as a problem, it does not view the class structure itself as a problem. Therefore, research on class and curriculum addresses mainly how schooling might overcome effects of poverty.

Specifically, functionalists investigate the relationship between income and educational attainment, including (a) the extent to which educational attainment produces individual economic mobility, (b) the relationship between student family background and educational attainment, and (c) the extent to which education can overcome effects of family economic disadvantage. For the most part, functionalist education policies approach class by infusing additional economic resources into programs for students from low-income homes to compensate for presumed deficiencies in their backgrounds, such as linguistic or motivational deficiencies. Compensatory curriculum in programs such as Head Start or early literacy teaches school skills or school readiness. Research

then evaluates the impact of such curriculum on children's learning and sometimes on their success in subsequent grade levels.

### Critical Theories

Critical theories of class are based on analysis of the desire of the capitalist class to exploit labor to maximize profit and its power to structure social institutions, including schools, for this purpose. Rather than focusing on how to overcome poverty, critical theories examine how elites control and benefit from a stratified class structure. Applied to curriculum, critical theories ask how different kinds of curriculum are distributed based on class, who benefits most and least from that distribution, and who benefits most and least from curriculum content. There are tensions among various critical perspectives regarding class and curriculum. Although some clearly delineate processes by which class relationships are structured and reproduced through schooling (including through curriculum), others emphasize challenging and changing those relations, using curriculum as a tool for consciousness raising. Some theorists address only class relations, while others address multiple relationships, usually including class along with race and gender. Britain has a more robust history of critically examining class in education than does the United States.

Research and theory that emphasizes class is generally rooted in the work of Karl Marx, who theorized how capitalism establishes processes of reproducing hierarchical relations between owners of the means of production and laborers. Although Marx did not write directly about how school participates in the reproduction of the class structure, others have taken up that inquiry. An early such work in the United States was Samuel Bowles and Herbert Gintis's *Schooling in Capitalist America*. Using mainly statistical analyses, they examined correspondences between the structure of capitalism and the structure of schooling. Specifically, they explored how the nature of classroom work, along with the nature of rewards students get, corresponds to the nature of wage labor, preparing the young to take their place as workers. Bowles and Gintis did not examine curriculum content, but were instrumental in laying a foundation for doing so.

Basil Bernstein, writing in *Class, Codes and Control*, theorized about how children come to accept or reject the class system as they go through school and how codes of class power structure curriculum. He posited that in a collection code curriculum, knowledge is hierarchically structured and academic knowledge is emphasized over everyday knowledge. The curriculum begins with basic facts and unfolds sequentially toward the deep structure of the academic disciplines. Conversely, in an integrated code curriculum, knowledge is viewed much less hierarchically and everyday knowledge is valued. The curriculum, usually organized around themes, emphasizes the knowledge construction process rather than accumulation of disciplinary facts and concepts. Bernstein's analytical tool *frame* refers to the degree of control teachers and students have over curriculum. Under strong framing, teachers and students receive knowledge from above; under weak framing, they actively participate in curriculum construction. Teachers and students learn their place in hierarchical relationships through the degree of power they have over selecting and working with curriculum. Integrated code curricula with weak framing empower lower-class students to use their own knowledge and questions. In contrast, collection code curricula with strong framing teach lower-class students to consume knowledge produced by elites.

Building on work of other Marxist, neo-Marxist, and critical theorists, including Bernstein, Pierre Bourdieu, Antonio Gramsci, and Geoff Whitty, Michael Apple has written extensively about relationships between class, curriculum, and power. In *Ideology and Curriculum*, Apple analyzes the relationship between the structure of a capitalist economy, and formation of consciousness in which people accept both capitalism and their position within an unequal class structure. Apple focuses on the mediating role of curriculum. He distinguishes among overt curriculum (intended, often published), curriculum-in-use (what is actually taught in a given classroom), and hidden curriculum (what students learn through the everyday regularities of classroom life). He draws attention to ways in which all three forms correspond to class relations in the workplace, preparing children to view unequal class relations as normal and their position within the class structure

as legitimate. For example, in kindergarten children learn to differentiate between work and play; work—the more important of the two—is what others tell them to do and is in contrast to play, which children control, but which they learn has less value.

Apple questions whose knowledge is selected for curriculum, by whom, who benefits most from that selection, and how schools give legitimacy and value to particular kinds and bodies of knowledge. Through both overt and hidden curriculum, social relations among the classes become commonsense. Apple also argues that schools are organized to distribute different bodies and kind of knowledge depending on whether students have been sorted to become part of the capitalist elite, managerial class, or wage working class. Systems of curriculum are rendered legitimate by using scientific rationales that close off ethical questions about purposes of schools, leaving discussion at a technical level that emphasizes how to make delivery and consumption of curriculum more effective. In *Official Knowledge*, Apple applies this analysis of curriculum to standards-based and privatization school reforms of the 1990s and 2000s. Contextualizing his analysis within neoliberalism and global capitalist expansion, he shows ways in which the new Right extended control over curriculum by attempting to nationalize it, tighten accountability for teaching it, and shifting education from a public good to a profit-generating commodity for the private market.

Most of Apple's work is theoretical, but it has both guided and benefited from empirical studies examining specific relationships between class and curriculum. For example, in an early influential study, Jean Anyon examined the relationship between class and the distribution of different kinds of knowledge. Anyon conducted classroom observations in five elementary schools in neighborhoods that ranged from working class to executive elite. In the working-class schools, she found classroom work to consist largely of repetitive copying and answering lower-order questions; assignments rarely tapped into children's thinking. Curriculum was remedial, consisting mainly of facts and skills to learn and regurgitate. It was also disconnected from children's everyday lives and excluded working-class or minority history. In the affluent-professional school, classroom work was designed to foster creativity and independent

thinking; rather than memorizing facts, children were taught to analyze them. Designed to prepare future professionals, the curriculum consisted of challenging conceptual material children were expected to learn to analyze.

Recent studies have reported similar findings in the contexts of expansion of global capitalism and increased achievement testing. For example, Elaine Hampton studied curriculum in over 20 schools in communities of maquiladoras for U.S. businesses along the U.S.-Mexico border. She found the curriculum oriented toward preparing the young for factory labor. Other recent studies have found lower-class students to receive test-preparation curriculum oriented around memorization of facts rather than conceptual thinking.

Although there have been many published analyses of textbook-based curriculum through the lens of race and gender, relatively few studies have examined social class in curriculum. Anyon conducted one of the earliest and most extensive such studies in her analysis of 17 history texts. She found the texts to be written from the point of view of economic elites; readers would learn more about this group than any other and would learn to regard the poor as responsible for their own poverty. Texts suggested that the United States is not class stratified, that almost everyone is middle class, and that people have rarely struggled over distribution of wealth. Further, texts emphasized elites' resolutions of social problems: labor disputes resolved through labor-management cooperation were described as successes, but labor-controlled actions such as strikes were described as failures. Texts taught nothing about working-class history. Although her analysis was published about 30 years ago, subsequent analyses of texts have found that little has changed.

There are some efforts to fashion curriculum around a critical class analysis, largely to empower lower- and working-class students to critique and work collectively to challenge the class structure. For example, *The Power in Our Hands* by William Bigelow and Norman Diamond offers unit plans for classroom teachers to teach about the history of union organizing in the United States. Theoretical works by authors such as Peter McLaren delve into questions that connect education, class, and global imperialism and have implications for curriculum. Public school curricula, however, leave little leeway

for critical perspectives about class. Some critical educators turn to popular education of adults as an alternative, often drawing from writings of Brazilian educator Paulo Freire. For example, John Holst studied implementation of adult socialist education within two revolutionary organizations within the United States (the Freedom Road Socialist Organization and the League of Revolutionaries for a New America).

### Interpretive Research

Interpretive research examines students' responses to curriculum, based on close observation of curriculum-in-use and the sense students make of it. Interpretive scholars assume that even if schools treat students as passive receivers of knowledge, students actively make meaning of curriculum. Interpretive research related to class has examined mainly lower- and working-class students' responses to the achievement ideology of schools and to the mainstream academic curriculum.

Several interpretive studies analyzed through a Marxist framework have examined the sense that working-class students make of school and its achievement ideology. For example, Paul Willis's well-known study *Learning to Labor*, found White working-class boys to reject school because they believed they would not become upwardly mobile anyway and that buying into the school's achievement ideology would separate them from their friends. However, rejecting school ironically sealed students' futures as wage laborers. Other similar studies, such as Lois Weis's *Working Class Without Work*, found working-class girls to view school as more instrumental than boys to their quest for independence, even if they largely share the boys' skepticism toward schools' achievement ideology in the context of eroding availability of jobs.

Interpretive research also examines how students make sense of specific subject area curriculum in relationship to their class backgrounds. For example, Sarah Lubienski studied higher-class and lower-class 7th-grade students' responses to mathematics curriculum in one classroom. The curriculum, following recommendations of the National Council of Teachers of Mathematics, emphasized thinking and problem-solving over memorization and equity of access for all students. Lubienski found the higher-class students to be comfortable with open-ended

discussion and confident of their ability to figure out mathematical problems, while the lower-class students tended to find discussion confusing, often requested the teacher to tell them the correct answer or procedure, and distrusted their mathematical ability. Familiar with both functionalist and critical research, Lubienski argued that class-based differences in students' responses in the classroom matter, but that teachers should not simply assume that lower-class students need a more didactic curriculum. Students' prior schooling probably contributed to those class-based differences. Promoting class equity might mean redesigning curriculum and pedagogy to take better account of lower-class students' knowledge without diminishing their intellectual potential.

## CLASSROOM MANAGEMENT

---

Classroom management refers to the teacher's ability to direct, organize, and facilitate the learning environment and student behavior within a learning context. Curriculum and learning are influenced by how a teacher organizes and designs instruction and how he or she motivates and engages students. Several factors that influence the progressive and proactive management of a classroom's learning environment and student behavior are described in this entry.

### Managing the Learning Environment

There is much to think about when arranging the classroom environment, arranging that includes not only the room, but also other contexts such as the media center, computer laboratory, and even places where field trips take place.

Beginning with the arrangement of desks and the creation of bulletin boards on classroom walls, the teacher manages curriculum and learning. A cramped classroom may cause friction among students. Ample space is needed for each student to promote respectful interactions. Aligning desks in rows will dissuade student interactions and collaborative learning, whereas groups of desks arranged together will promote conversations among students. When students' work is posted, they understand that it is valued.

The amount and quality of materials and equipment, such as books, paper, computers, and other resources, will help determine how a teacher manages the classroom. Substitute materials may need to be used if funding is not available, and outdated texts must be updated with newer resources.

Learning is affected differently when students are expected or choose to work on their own, with a partner, or with a small group. There are advantages to each. Working with a partner allows more

opportunities for expressing one's voice than working with more peers in a small group. Working with several peers allows students to learn from multiple perspectives. Independent work gives learners a chance to explore their interests and questions.

An educator's teaching philosophy and expectations for students' learning will guide classroom management. When teachers perceive the learning environment as an opportunity to model engaged learning and to teach in ways that motivate students to want to learn, they manage the environment in productive ways.

### Managing Student Behavior

Managing students is not the same as disciplining them. Discipline connotes rewarding or punishing behaviors. Although there are times when a teacher redirects and reprimands behavior through methods such as time out or withdrawal of privileges, classes are best managed through preventive, proactive approaches. Research shows that when teachers motivate and engage students, they encourage them to want to learn and channel their energies toward productive behaviors. Students are motivated by teachers who share their excitement about learning. Authentic tasks that are student centered or provide for student choice are highly motivating. Realistically, however, there are curriculum topics that may be state mandated or may not be interesting to learners. Providing rationale for why certain materials are required may help students develop intrinsic motivation for learning.

For students to learn, they must be attentive to and focused on learning. Students are engaged learners when they are active thinkers who spend time on task, whether that task is reading something, discussing a topic, or doing a hands-on activity. Also, when students become accountable for their learning, they engage in meaningful and purposeful learning. Students must initially be taught how to interact and learn in groups before they are expected to collaborate with peers in an academic capacity. A teacher effectively manages interactions among peers by teaching communication and social skills.

### Evolution of Management Practices

Over the past decade, as the reliance upon evidence-based teaching practices has influenced

curriculum and instruction, educators' beliefs about and practices in classroom management have begun and continue to evolve. The one-room schoolhouse image of teacher–student interactions in which the teacher initiation is followed by students responding and the teacher evaluating their responses, typically calls for students to raise their hands and wait to be called upon. In this context, classroom management is evaluated by how quiet the room is and whether or not the students are listening, following directions, and waiting their turns.

However, educators have learned through research that approaches such as collaborative learning and student-centered inquiry foster student motivation and engagement with learning. The teacher's role has changed. When collaborative learning is the expectation, classrooms are characterized by students interacting with each other, talking, problem solving, and moving about the room as needed to gather resources or consult other groups. Teachers act as facilitators and guides on the side rather than the sage on the stage or expert with all of the right answers. Therefore, classroom management takes on a different look as expectations shift.

As research continues to form new knowledge about teaching and learning, the concept of what it means to manage a classroom of students will, undoubtedly, evolve. Factors such as technology and diversity will play important roles in shaping what a productive learning environment is and what student behaviors are considered acceptable and desirable for learning.

## COALITION OF ESSENTIAL SCHOOLS

---

A network of schools joined by a common curricular vision, the Coalition of Essential Schools (CES) grew out of a decisive moment in U.S. educational history. Reports such as the 1983 *A Nation at Risk* sounded the alarm that U.S. students and workers were dangerously unprepared to compete in the global economy. For curriculum studies, it was a time of radical rethinking and comprehensive reform. It was against this backdrop that Theodore (Ted)Sizer and colleagues undertook “The Study of High Schools.” A history teacher and headmaster turned educational researcher, Sizer set out to observe a broad range of high schools and fundamentally reexamine the institution. The result was *Horace's Compromise*, Sizer's influential portrait of the problems and possibilities of the U.S. high school published in 1984. In that same year, he launched the coalition to help realize his vision of reform.

Sizer found that high schools had become more system driven than people driven, with underpaid, overworked teachers presiding over large classrooms filled with unmotivated students. Schools were attempting to do too much, Sizer concluded, and had lost sight of their essential mission. To articulate that mission, Sizer drew on Mortimer Adler's *Paideia Proposal*. Adler advocated a shift from thinking in terms of grades and subjects to focusing on a set of core skills cultivated throughout schooling (reading, writing, speaking, listening, measuring, estimating, and calculating). This change in focus entails further shifts in pedagogy, administration, and evaluation. To cultivate thinking and communication skills, teachers would need to add modeling, questioning, and coaching to traditional, didactic methods. To support such personalized instruction, administrators would need to provide smaller classes and longer periods. To enlist students in this process, evaluation should take the form of exhibitions demonstrating

students' mastery of key skills. Sizer even suggested that schooling should cease to be compulsory once students had demonstrated their proficiency in such essential areas as literacy, numeracy, and civic understanding.

CES distilled Sizer's analysis into 10 principles. The school should (1) prioritize depth over coverage in order to concentrate on (2) its central mission of helping students learn to use their minds well, a goal that (3) must apply to all students. Teachers should be supported (4) to offer personalized instruction and expected (5) to put the school and its mission first. (6) The budget should be primarily devoted to supporting teachers and students to achieve this goal. (7) Students will be seen as workers and teachers as coaches, as students work toward the goal of (8) demonstrated mastery. The school should evince (9) an ethos of decency and trust and (10) a commitment to democracy and equity.

It is these principles that unite and inspire a diverse group of schools across the country. Beginning with just 12 secondary schools, CES now boasts approximately 1,000 schools and affiliate centers. Coalition schools are both public and private, primary and secondary, comprehensive and specialized, and urban, suburban, and rural. CES demonstrates its commitment to equity by recruiting schools serving a wide range of communities.

Far from replacing one bureaucratic system of school control with another, CES encourages its members to cultivate their distinctiveness and expects them to develop local interpretations of the common principles. Although coalition schools are autonomous, they are not isolated. CES supports its members to discuss their common aims and different approaches in regional and national workshops and in an annual Fall Forum. The central office shares best practices through its online journal, *Horace*, and offers mentoring and evaluation to its affiliates.

As with any back-to-basics movement, there will be ongoing debates over what is essential. For example, Sizer's stance that even foreign language study is inessential—another symptom of the bloated shopping mall high school—seems increasingly questionable in the globalizing world. It will be interesting to see how the coalition evolves to meet this and other challenges. In the meantime, support for CES continues to grow, as

the Bill and Melinda Gates Foundation recently provided a 5-year grant to establish small schools and mentoring programs.

## COGNITIVE PLURALISM CURRICULUM IDEOLOGY

---

Cognitive pluralism is a theory of knowledge acquisition that argues that there are multiple ways of receiving and perceiving information and that each individual's learning experiences are unique in the values, beliefs, assumptions, and ideas that accrete to his or her personal knowledge. As a consequence, these multiple-perspective inputs are incorporated into the learner's accumulated knowledge through mediating processes that reflect the influences and biases developed in prior learning. These internal and external influences have an impact on the process of representation, creating the individual's unique perspective and a personal base of accumulated knowledge.

Although many people in the education field acknowledge the existence of these multiple streams of data, there is some debate over the impact and influence cognitive pluralism exerts over learning. Cognitive pluralism adherents fall into three groups or categories: descriptive pluralism, normative pluralism, and evaluative-concept pluralism. Although descriptive and evaluative pluralism address critical issues such as race, culture, and gender differences, normative pluralism recognizes these issues,

but argues that they are less significant to learning than the need to teach a common culture.

Descriptive pluralism holds that cognitive development occurs through the individual, personal activities and experiences of each learner. Knowledge acquisition takes place through a process of evaluation of beliefs and the creation of unique and personal systems of morality, rationality, and lore. A group of learners may experience the same lesson, but because individuals developed and learn from their own set of lived experiences, the way they perceive, imagine, evaluate, and incorporate the lesson into their thinking will be singularly distinctive.

Normative-cognitive pluralism argues that although individuals may learn through differing systems of learning, those systems may be equally good. This position argues that there is little difference between the kinds of data individuals process or in the methods they use and that the effect on learners would be minimal and noninvasive to normal cognitive development, implying that different culture's systems of learning may be equally effective in cognitive development.

Evaluative-concept pluralism maintains that the process of learning starts when there is a rationale for gaining knowledge. The reasons for learning, the goals for success, and the value systems of different cultures vary greatly in their focus and in the direction they drive learners. This is a relativistic position arguing that generally systems are good for different people, and what constitutes a good system depends on the living and learning environments of the individual.

The opposite of cognitive pluralism would be cognitive monism, the belief that all peoples use essentially the same cognitive processes. It has been the long-held view that language is the sole tool of mediation for thought. Many critics of this belief have pointed to complex symbols, formulas, and images that have co-opted language in cognitive development process in cases where language would be too effusive or cumbersome. As language and other symbolic references evolve with the culture, the predominance of word in the thought process remains unchallenged, but the growing recognition of the mediating abilities of other forms of symbolism and additional sensory information has led many educators to take note of their impact on the field of curriculum studies.

A general simplification of the process of thinking may be seen as the creation of mental images that represent our thoughts and ideas. These images can consist of language, formulas, music, mnemonic devices, mathematical signs, and visual experiences that we store for later recall and further remediation. Language has long been thought to be the sole medium of this process of image making, but a growing number of cognitive researchers note the important influence of other sensory information. In addition, many argue that mediation is a product of sociocultural influences and that values and beliefs evolve with the culture. Although a group of learners may receive the same information, their personal lifetime learning experiences will shape the way that information is received and interpreted. Individuals incorporate their own biases, methods, strategies, and symbols into their growing and evolving thought processes.

An important element often overlooked in cognitive development is the role played by the culture and other social forces in the life of the learner. These elements help to shape the routines, colloquialisms, interests, activities, and beliefs of individuals. By providing feedback, mirroring styles and fashions, providing a basic foundation for morality, customs, and social exchange, our culture wordlessly impacts our values and the process of negotiating knowledge. In observations and interactions with our culture we establish the norms and mores by which we live and with which we evaluate future learning.

It is through a culturally oriented conduit that we learn of cultural pride and prejudice, social and economic stratification, social acceptance, and cultural bias. We are all able to distinguish the nature of an environment or the quality of a thing without verbal cues or other semiotic means. The individual's sense of place and status are integral lines of information that can either aid or hinder in the developmental process. Learners who can find no gain or reason for learning or who perceive their learning environment to be hostile will often lack the motivation to achieve in learning. This effect may help to explain chronic educational failure among poor and minority groups.

There are numerous implications for these theories in curriculum studies and in education in general. The notions of how and what we teach are complicated by the issues of how, what, and why we learn. Issues of cultural and learning differences

raise questions of fairness in teaching and assessment, as well as concerns for the accuracy of testing and evaluations. Some hold that this represents a miseducation of learners and a need to restructure lessons as well as teaching and learning methods.

Many now speculate on the possibilities of art infused learning, multiple forms of intelligence, and cross-cultural learning. Artworks representing past eras and movements add to the understanding of historical periods and concepts. Dance provides experiences and knowledge for kinetic learners. Spatially oriented learners find insight from exploring classic architecture just as students gain social insight from exploring the wealth of lore of minority cultures. Providing access to multiple forms of learning and supporting individual learning needs encourages wider participation in the learning community and the development of broader perspectives in classrooms.

Researchers in cognitive pluralism have found that not only is there more than one way to see, but also there are many different types of information to process. Language, both written and oral, is complemented by our sights, sounds, smells, and tactile experiences in the creation of knowledge. Reading a play can never match the richness of information one gets from watching the actors' expressions and movements or gauging the reactions of one's fellow audience. This broad spectrum of information, semiotic and sensory, presents challenges for educators to create lessons that reach and teach all individuals in the class and incorporate more perspectives, skills, and insight into their students' value systems.

Education writers, such as Harry Broudy, Elliot Eisner, and Maxine Greene, have argued vigorously for aesthetic inquiry and a greater infusion of the arts into the learning process and across disciplines. They point to the general need of aesthetic tools to better understand and interpret how our culture uses art to transmit ideas. Many of our rites, rituals, customs, and beliefs are infused with works of art and other references to aesthetic values. It is hard to imagine discourse today that does not contain historically significant references to the art embedded in our culture. With an increasing use of image and art in our highly communicative society, it is necessary to equip learners with the ability to interpret, understand, and make use of the aesthetic symbols of their culture.

The hopes of cognitive pluralistic approaches are to broaden the possibilities for learners to experience more and to discover more through their experiences. When students are taught, they add the learning they value into their personal body of knowledge. The student takes information and weighs it against prior knowledge. If the lesson is dissonant to the learner's beliefs, it will be difficult to accept, but if it has a true ring of authenticity, it becomes part of the learner's knowledge. As cognitive pluralism gains in popularity schools may see revolutions in teaching, teacher training, aesthetic learning programs, testing systems, and protocols. The challenge for educators and policy makers will be to help students to make optimal use of what there is to learn.

## COLLECTIVES OF CURRICULUM PROFESSORS, INSTITUTIONAL

---

Influential professors in the area of curriculum studies have congregated at certain key universities over the years. Professors at a particular place over a period of years are referred to as a *collective*. Collectives at several major universities in the United States and Canada have had a major influence in shaping curriculum studies. The *Encyclopedia of Curriculum Studies* features several historical curriculum studies collectives among its listings.

A variety of studies (including citation analyses and genealogical research of mentor–student relationships and studies of preferences of books, articles, and other influences on curriculum studies) reveals the prevalence of certain professors in key decision-making roles in the curriculum field. For instance, these professors tend to be more widely published, cited, and called upon to serve on editorial boards and in leadership positions in scholarly and professional associations.

Private and public universities have housed these collectives over the years. Two of the most highly recognized collectives are Teachers College of Columbia University and the University of Chicago. The first department of curriculum was the Department of Curriculum and Teaching at Teachers College, started in the mid-1930s by Hollis Caswell, later president of Teachers College. This department derived from the influence of John Dewey in the philosophy department at Columbia University and many who followed him to create the field of social foundations of education and others who emerged as curriculum leaders. Influenced, too, by the measurement revolution in psychology and educational psychology led by Edward L. Thorndike, James M. Cattell, and others, the curriculum field harbored both social foundations and measurement origins. Similarly, curriculum scholars emerged at the University of Chicago from the influence of Dewey and his Laboratory School prior to his move to Columbia in 1905. After Dewey moved, Charles Judd brought to Chicago new views of experimental psychology derived from study with Wilhelm Wundt (as Cattell had brought to Columbia and was advanced there through his student, Thorndike).

Collectives are seldom like-minded; rather, they can be diverse individuals who stimulate ideas by dissent with one another as much or more than collaboration. Moreover, they produce doctoral students who advance the field. The emphasis in this encyclopedia is on historical collectives that go back at least three generations from the present. Some universities were highly influential, such as Harvard; however, their key faculty were in fields adjacent to curriculum studies, such as William James in psychology, Alfred North Whitehead in philosophy and mathematics, Robert Ulich in history of education, Walter Dearborn in educational psychology, Alexander Inglis in education more

generally, Isreal Scheffler in philosophy of education, Jerome Bruner in psychology, Noam Chomsky in linguistics, and Howard Gardner in psychology, who represent four or five generations of highly influential scholars, though there have been few in curriculum studies. Similarly, there are several U.S. and Canadian universities that have first-rate coteries of curriculum scholars; however, their influence spans only one or two generations. Although the contributions of both long generations of scholars who have influenced curriculum studies and contemporary collectives who have shaped the field for the past 20 or 30 years are indeed substantial, they do not fit the criteria to be included in the historical collectives presented in this encyclopedia. This lack of attention should not be seen to diminish the importance of their work.

Central questions and observations emanate from the study of historical collectives in curriculum studies. How much interaction has existed or exists among them? What is the nature of such influence? To what extent do they serve as a stimulus to scholarly work? *Collective* here does not necessarily mean cooperation in the political or union of workers sense, only a collection of individuals who may or may not be in agreement. Surely, there has been much competition for status and influence within and among collectives. Because collectives have surfaced at universities with considerable prestige, one needs to ask to what extent do they limit the domain of scholarship by a kind of colonizing power that puts them in the spotlight and relegates others to subaltern status.

## COLONIZATION THEORY

---

Colonization theory can be historically situated within early European conquest, domination, and colonization of various countries in Africa, Asia, and the Americas. This external control of foreign territories created a metropole (the colonizing country) and colony (the colonized lands) based on unequal power and exploitation of the colonies by the metropole. Educational curricula and content was a key tool in enabling and enforcing the power and control of colonial regimes. The forced external control is often referred to as the classical colonial model. This model is based on political, economic, and cultural hegemony of the metropole on the colonized lands. However, contemporary colonization theory also includes what is referred to as internal colonialism, meaning oppression and domination of certain groups of people within a country. Internal colonialism mirrors the ideology of classical colonialism in its social inequities particularly based on racism and cultural domination of majority groups over minority groups and thus expands colonial theory to be inclusive of internal domestic oppression. In order for colonization to be effective, those who were colonized had to be indoctrinated into a certain mind-set that elevated the superiority and power of the colonizer. Colonization theory continues to affect the educational decolonizing efforts of previously colonized nations.

Franz Fanon describes four phases through which classical colonialism worked and are useful in understanding the role of curriculum in enabling the assumptions of colonization theory. The first phase was one of forced entry into foreign lands and exploitation of the natural resources of the colonies. The second phase entailed the establishment of a colonial society that denigrated indigenous culture, practices, and knowledge while elevating that of the colonizing nation. In order to

cement the difference between the superior colonizer and inferior colonized relationship, the third phase had to portray the colonized peoples as savage, inhuman, and in need of being civilized via colonial impositions. The first three phases resulted in a race-based system that was established during the fourth phase of colonization. This race-based system permeated the political, social, cultural, economic, and educational systems of the colonies and was designed to privilege the colonizer and to ensure the subjugation of the colonized. Hence, education became a powerful tool to propagate this superiority–inferiority complex.

European, White superiority and Black inferiority was packaged through curricula, textbooks, resources, material, and structural curriculum elements and policies. Textbooks in particular clearly demonstrated the critical role of education and curricula in maintaining the colonial ideology. Colonial ideology denied indigenous peoples useful knowledge about themselves and their world and supported a climate designed to consolidate a slave mentality.

Decolonizing efforts sought to redress the doctrine of White supremacy, appropriated knowledge, definitions, meanings, and constructed canons and theories that were formulated on the basis of particularized European experiences and given a universal dominant status. Of importance was the development of curriculum materials that worked toward the effort to decolonize the prevailing Eurocentric epistemology and to recenter the realities of indigenous knowledge within postcolonial societies. To this day, decolonization is still intricately intertwined with global, Western, and Eurocentric politics. Educational decolonization is often fraught with contradictions and hypocrisy as the colonial ideology is often repackaged in democratic curricula.

The changing global demographic mobility and technological interaction for global educational networking insists on critical engagement with colonized educational histories and identities. By locating the historical as well as contemporary contexts of colonial, imperial, and decolonizing curriculum production within colonial and postcolonial countries it becomes important for curriculum studies to interrogate how colonialism and imperialism shaped and continues to shape the curricula imagination of global education and citizenship within newly

democratized nations. It is useful within curriculum studies to examine decolonizing approaches and analyze the interconnected historical and contemporary contexts and forms of colonial–imperial curriculum production and consumption. Although not an uncommon phenomenon for both developing and developed nations, it is an ongoing struggle to figure out the mechanisms that impede successful transitions from colonized to postcolonial curricula.

Decolonization should account for the interconnectedness of the West and the former colonies. By locating the historical as well as contemporary contexts of imperial curriculum production within and outside the metropole, contemporary curriculum studies can expand and complicate the ways in which curriculum knowledges are constructed, contested, and renegotiated within postcolonial cultural and geographic contexts. Such an interrogation becomes critical to understanding how imperialism shapes the curricular imagination of democratic education and can inform contemporary discussions on science, history, geography, and race in education discourses. Curriculum studies utilizing transnational frameworks can offer alternative spaces to conceptualize and impart colonial–postcolonial curriculum knowledge. Contemporary projects of internationalizing curricular studies allows for the conceptualization of local–global relationships of curriculum theory. In addition, critical curriculum theorists have argued for the interrogation of Eurocentric forms of knowledge that continue to sanction monolithic ideas of truth and reality and an interrogation of the political context of knowledge and how knowledge shapes the inclusion or exclusion of perspectives in schools. This cross-examination of transnational postcolonial curriculum studies offers productive possibilities to understand how certain knowledges are valued, made credible, or rendered invisible. This cross-examination also allows us to interrogate the construction, interpretation, and practice of democratic education and has implication for established and newly democratized nations.

An examination of the impact of colonization theory on contemporary educational efforts offers critical insights into the possibilities and dangers inherent in analyzing curriculum as a tool for continued colonialism–imperialism and decolonization. It is important that current curriculum studies address the critical and enduring implications of

colonial and decolonizing curriculum discourse and pedagogy for the ways in which we rethink curriculum in the forms of school textbooks, teacher training, and educational policies to challenge the history and legacy of colonialism and imperialism.

## COMMERCIALIZATION OF SCHOOLING

---

Commercialization of schooling refers to private sector influence on the operation, instruction, curriculum, or aesthetic of schools. The most familiar example of commercial presence in education is the passive advertising found on sports fields and school cafeterias. Businesses, and to a lesser extent nonprofits, have also used more active approaches that affect teaching practices and uses of student time and directly alter or add to curriculum. In return for this access, schools receive money or in-kind contributions. Although there are several examples of commercialization in schools that support legitimate partnerships with the business community, there is also a growing concern over the ethics of providing businesses with direct access to advertising opportunities and the curriculum. Scholarship in the field of curriculum studies has explored the impact of business partnerships on altering curriculum, tracked the time taken out of the traditional work day for commercially driven activity, and analyzed the impact of commercialization on student health and learning.

Commercial access to schools is not new, but it did grow increasingly more popular over the last quarter of the 20th century. Commercialization of schooling becomes more controversial when it is more directly involved in driving the curriculum and as it is deemed to promote activities or knowledge that is harmful to children. Advertising has moved from extracurricular fields and buildings to cafeterias, school hallways, buses, and inside the classroom itself. The most popular example of advertising in the curriculum is Channel One. Originally launched by Whittle Communications in 1989, Channel One provides high schools with original news programming. In exchange for students watching advertising from Channel One sponsors, the school receives the news show content and in-kind use of equipment. In addition to Channel One, there are instances where schools have worked with local companies to provide advertising directly in the curriculum or even on homework assignments in exchange for cash benefit.

Although advertising contracts represent a small percentage of the total school budget, the revenue generated becomes discretionary funds. As less discretionary money is available at the school level, there is increasing pressure to seek out alternative revenue streams, such as commercial school access, to support important school-based programs. In some cases, businesses have involved themselves heavily in in-kind donation efforts without direct advertising in an attempt to influence future consumer behavior, increase their recognition among youth, and enhance their own bottom line. Computer donations are an example of this where the donation of new equipment has long been seen as a way to help build brand loyalty among students. Donations of used computer equipment can be more cost-effective than storing or disposing of computers that quickly hold no value for the company.

Legislation has appeared in several states limiting or regulating commercial influence in schools. Although many examples of state law on the matter are quite vague, the one area of commercial access to schools that has received the most explicit attention has been soda and candy vendor contracts. The early part of the 21st century has seen an increase in districts adopting policies that either ban or place limits on direct sales and vendor contracts. As a result, after almost a quarter century of

growth in commercial activities in schools, this trend started to reverse itself slightly in 2001.

The primary focus of state involvement and district policy has been to protect the welfare of the student and guard against long-term exclusivity contracts. Wisconsin, for example, passed legislation that banned soda vendor contracts in schools that placed limitations on the availability of milk for students. Legislation such as Arkansas's Body Mass Index Assessment program to address the problem of childhood obesity has had a ripple effect on many food-related commercial activities in schools.

Trends in school commercialization appear to be toward more regulation and oversight to ensure that efforts to generate revenue do not undermine the school curriculum. Even without limitations on the types of food or beverage schools can serve, there is widespread concern over the conflicting message some vendor contracts present. In light of growing attention in the school curriculum to address healthy eating and physical fitness habits, schools that accept promotional revenue from soda and candy vendors risk undermining their own healthy eating initiatives.

## COMMISSION ON THE SECONDARY SCHOOL CURRICULUM REPORTS

---

Although the Eight Year Study is typically remembered as the work of the Commission on the

Relation of School and College and the academic comparison of 1,475 pairs of students in college, the reports of the Commission on the Secondary School Curriculum (more commonly known as the Thayer Commission) made a significant contribution to the field of curriculum studies and served to define the study's conception of progressive education curriculum at the secondary school level.

With the official formation of the Aikin Commission (the Commission/Committee on the Relation of School and College) by the Progressive Education Association in April 1930, the need for assistance in curriculum development to support the study became apparent. Accordingly, in May of 1932 the Commission on Secondary School Curriculum was formed with V. T. Thayer as chair. With General Education Board funding, the Thayer Commission sponsored two complementary types of activities; the first was the Study of Adolescents chaired by Caroline Zachry that sought to describe in rich detail the development of adolescents, while the second involved formation of five subject-area committees charged with formulating the functions of each area in general education and making recommendations for curriculum and instruction. After working from 1932 until 1940, eight volumes were published relating to the commission's subject area work. Of these, *Science in General Education* written by the Committee on the Function of Science in General Education, chaired by Harold Alberty and including Thayer among its members, is considered the most significant. This volume, published in 1938, presented a conception of the place of science in general education, centering on the ways in which the science school curriculum could meet the fundamental needs of adolescents—understood as both personal and social in origin—so that not only would the fullest potential of the individual be achieved, but also effective democratic citizenship be promoted. Drawing on the Study of Adolescents, needs were identified in four areas of living: personal, immediate personal–social relationships, social–civic relationships, and economic relationships. This conception of needs underpinned much of the other subject area committees' work, explicitly grounding two volumes, *The Social Studies in General Education* and *Mathematics in General Education*, both published in 1940, and *Reorganizing Secondary*

*Education*, the summary of the commission's position on curriculum development and revision.

In addition to these four volumes, the commission published works on the visual arts and language in general education. These two books also are concerned with meeting student needs, but represent slightly different emphases. *The Visual Arts in General Education* is primarily concerned with the place of art education in personal development and with living creatively and richly. The authors argue that art expression is a human right to be cultivated as means for enriching shared living. *Language in General Education* is mostly concerned with the place of language as a means for relating to the world and as a tool for expressing and realizing the self and gaining control over experience. Effective communication, the authors argue, is not only essential to personal development, but foundational to democratic citizenship. To assist English teachers in their task of redesigning the curriculum, the commission sponsored two additional books. A methods book, *Teaching Creative Writing*, was published in 1937. The second, published in 1940, *Reader's Guide to Prose Fiction*, written by Elbert Lenrow, included bibliographies of 1,500 novels organized around a set of concerns thought common to adolescents. From this volume, teachers could easily select relevant and appropriate pieces of literature for classroom study.

In an unusual development to ensure the value of commission publications, with the exception of *Reorganizing Secondary Education*, prior to publication each of the sponsored volumes underwent an extensive period of testing in mimeographed form and sometimes in installments. Revisions of *Teaching Creative Writing* followed distribution of 150 copies of a draft version for evaluation and experimentation by teachers, administrators, and professors from across the country and representing various types of institutions. Criticizing *Science in General Education* was a central activity of the first workshop sponsored by the Progressive Education Association, held during the summer of 1936 at Ohio State University. With backgrounds in science and mathematics, the 35 teachers attending the workshop provided detailed criticism that guided subsequent revisions.

## COMMITTEE OF FIFTEEN OF THE NATIONAL EDUCATION ASSOCIATION

---

The Committee of Fifteen was a committee of the National Education Association (NEA) that was entrusted with revising the elementary curriculum. In 1893, the NEA met in Boston, and Colonel Francis Weyland Parker called for a motion to establish a Committee of Ten to work on revisions to the elementary curriculum. When the five members of the nominating committee were added to the 10 original members, the group became the Committee of Fifteen. Led by Chairman William H. Maxwell, who had been the first superintendent of schools in Brooklyn, New York, and Commissioner of Education William Torrey Harris, the Committee of Fifteen also included 12 current and former city school superintendents. The Committee of Fifteen's mission was similar to that of the Committee of Ten on the secondary schools that had been charged with revising the secondary curriculum in order to promote uniformity in school offerings. Unlike its Committee of Ten counterpart, the Committee of Fifteen's report met with immediate criticism.

Harris played a pivotal role in leading the Committee of Fifteen and writing the report. He was a well-established figure in education at the time the report was published, having served as U.S. Commissioner of Education from 1889 to 1906. Harris is often remembered for establishing

the first kindergarten in the 1870s when he worked as the superintendent of the St. Louis school system. Harris was also quite active in the NEA, serving as the organization's president in 1873. In his public role as an educational leader, he advocated a curriculum in which children acquire knowledge needed to fill "the five windows of the soul," which included the areas of mathematics, history, geography, grammar, and literature and art.

The Committee of Fifteen report reflected much of Harris's educational philosophy. In order to divide the work of the Committee of Fifteen, three subcommittees were established. One subcommittee dealt with the training of teachers, and another focused on the organization of the city school systems. A third, the Subcommittee on Correlation of Studies, dealt with the elementary school curriculum and was led by Harris. Of the three reports, Harris's report caused the most significant amount of controversy.

Several currents of educational reform prevailed in the 1890s, many of which were influenced by the philosophy of Friedrich Froebel, Johann Pestalozzi, and Johann Herbart. Established in the United States in 1893, the Herbartian Society, which later became the National Society for the Study of Education, emphasized an educational philosophy that included concepts such as correlation, concentration, apperception, and cultural-epochs. Leading Herbartians included Charles DeGarmo and brothers Frank and Charles McMurry. Another prominent educational reform during this time period was known as the child-study movement, lead by G. Stanley Hall. Child-study advocates placed child development and the newly emerging science of education at the forefront of reform efforts. The educational philosophy espoused by Harris in the Committee of Fifteen report came into direct conflict with Herbartianism and the child-study movement.

Harris, University of Illinois President Andrew S. Draper, and Superintendent Horace S. Tarbell served as lead authors, respectively, of the three different sections of the report. Harris had chaired the subcommittee on correlation, which dealt with the elementary school curriculum. The report included a detailed chart with the various subjects to be studied, the grade level in which they were to be studied, and the number of minutes each week they were to be studied. Immediately, objections

ensued. These protests are recorded in the NEA proceedings. The most common complaint was that the report was an elaborate defense of the status quo, and that correlation was interpreted in a manner contrary to the meaning the Herbartians advocated, which was to unify the curriculum around a central theme. In the proceedings of the Cleveland meeting, Francis Parker opined that the report essentially was Shakespeare's *Hamlet* with Hamlet left out. Draper's report on the organization of the city school system and Tarbell's report on the training of teachers faced less opposition.

In the end, the Committee of Fifteen made recommendations for the elementary curriculum at the 1895 meeting in Cleveland that preserved the existing elementary curriculum for the next decade. Historian of the Committee of Fifteen, Henry Warren Button, noted in his analysis of the report that Harris was part of the respected establishment, and it is only natural that he would have preserved his conservative mode of thinking and talking about schools. Ultimately, Herbartianism, child study, empirical psychology, and social efficiency had a greater impact on the elementary curriculum and the general field of curriculum studies.

## COMMITTEE OF TEN OF THE NATIONAL EDUCATION ASSOCIATION

---

In the 1890s, the Committee of Ten's landmark report fostered the development of the emergent

field of curriculum studies. Concerned with the problem of inconsistent college entrance requirements, the National Education Association (NEA), at a meeting in 1892, authorized the Committee of Ten to recommend standards for the various core subjects in the secondary school curriculum. The Committee of Ten comprised nine subconferences based on the academic disciplines of (1) Latin; (2) Greek; (3) English; (4) modern languages; (5) mathematics; (6) physics, astronomy, and chemistry; (7) natural history; (8) history, civil government, and political economy; and (9) geography. Despite its limited charge, the committee's work ultimately extended far beyond the purpose of developing common college entrance standards and significantly impacted the high school curriculum.

Nicholas Murray Butler, who became the NEA president in 1894 and who later served as Columbia University president, was instrumental in appointing the 10 members of the committee. Charles W. Eliot, the Harvard University president responsible for ushering in the elective course system, served as the chairman of the Committee of Ten. Other prominent members of the committee included William Torrey Harris, commissioner of education, and James Burrill Angell, president of the University of Michigan. Butler believed that the group comprised a remarkable committee, but the all-White male members predominantly hailed from elite eastern institutions.

Published in 1893 by the U.S. Government Printing Office and 1 year later by the American Book Company, the report recommended four different courses of study in high school and advised against curricular distinction for students preparing for college and students preparing for life. Such recommendations represented a distinct transformation from previous curricular recommendations, such as the traditional mental discipline curriculum embodied in the Yale Report of 1828, which encompassed humanist studies such as English, Latin, Greek, and mathematics.

Ultimately, the authors of the Committee of Ten report called for a more comprehensive program of studies in secondary schools, which also included the study of history and modern languages, for example. In large part, the conferees also established a degree of cohesion and uniformity among the secondary school course offerings.

The Committee of Ten's report laid the foundation for the modern secondary school curriculum. In addition, the report also recommended that teachers use new teaching methods that engaged and encouraged students rather than employ the traditional pedagogical method of having students display skills of rote memorization.

Of critical importance, the report noted that education for life was the proper preparation for college. Such statements clearly reveal progressive educational thought and the influence of leading thinkers such as John Dewey. Indeed, the school curricula needed to be broadened not only to stimulate students' interest, but also to serve a functional need to educate students for life. The massive immigration during this time period led to dramatically increasing high school enrollments. With the inescapable growth and changes transpiring in U.S. society, the committee's report planted the seeds for curriculum change in schools.

Nonetheless, the Committee of Ten noted that the nine reports, all written by educational leaders and experts in the various subject area disciplines indicated a desire to have elements of their subjects taught earlier in the elementary school curriculum. These recommendations to modify primary school curricula ultimately led to the Committee of Fifteen report that addressed the curriculum in the nation's elementary schools. According to Herbert Kliebard, Eliot's Committee of Ten report was met with both approbation and criticism. G. Stanley Hall was one of the leading critics of the report, and debate about the intent of the Committee of Ten's report pervades even contemporary educational debate.

The progressive educational reform that resulted from the work of the Committee of Ten was fortuitous. As U.S. students increased in number and diversity, the need for curriculum change became more profound. U.S. schools were compelled to respond. Progressive era changes to school curricula, however, did not result solely from rising enrollment in U.S. public schools. As evidenced in the Committee of Ten report, a subtle egalitarian sentiment that the recommendations should be the same for all, that education was preparation for life and therefore suitable preparation for college, and that all students were entitled to the best methods of teaching the various subjects, pervaded the report. Finally, the Committee of Ten report mentioned

that the methods teachers employed should cultivate the mind and teach the individual to think, rather than to promote rote memorization. These primary curricular ideals embodied in the Committee of Ten report were the hallmarks of progressive era education reform movements.

## COMMONPLACES

---

Commonplaces are interrelated curricular components encompassing learners, teachers, content, and context. Scholars in curriculum studies have employed commonplaces to frame curriculum development, to develop a heuristic for understanding curriculum, and to create a structure of analysis for curriculum inquiry.

Curriculum scholar Joseph Schwab delineated the commonplaces to guide the process of curriculum development. He explained that when people come together to revise curriculum, they need knowledge of these fundamental elements. Schwab's first commonplace, subject matter, means comprehension of content disciplines, their underlying systems of thought, and curriculum materials. Knowledge of learners involves familiarity with students including children's developmental abilities,

their unique qualities, and their probable futures as influenced by the environment of families and community (rather than how education might transform their possible destinies). Schwab referred to classroom, school environments, and influences on them as the third commonplace, the milieu; he called for recognition of the context of learning—social structures within schools, the influence of families, and the multitude of values and attitudes stemming from the community and culture surrounding the school. The fourth commonplace, teachers, includes educators' subject matter erudition, their personalities—such as their flexibility or openness to new methods—and their biases or political stances.

Schwab described each commonplace as a body of experience necessary for curriculum making and revision. He explained that there should be coordination among these commonplaces and that one component should not dominate the others. Schwab also insisted that when making curricular decisions, representatives with deep knowledge of each commonplace should participate in deliberations. Further, he believed that the curriculum specialist, who understands the practice of curriculum making, ought to facilitate conversations among representatives of the commonplaces and guide the curriculum-making process. Schwab's attention to commonplaces created a deliberative progression of curriculum planning that de-emphasized standardization as curriculum planners consider the unique nature of each classroom and numerous influences upon curriculum from outside the classroom.

Other scholars have drawn on the commonplaces to understand and analyze curriculum. Seeing curriculum as a fluid narrative stemming from teachers' sense of self and practice, Michael Connelly and Jean Clandinin formulated the commonplaces as a heuristic to inspire teachers' self-reflection and articulation of their stances as curriculum workers. Unlike Schwab, who placed the curriculum specialist as the expert in charge of curriculum planning, Connelly and Clandinin viewed teachers as curriculum planners and commonplaces as their analytic tools to develop their own narratives, to understand historical trends of curriculum, and to gain insight into contemporary controversies. In particular, by attending to the commonplaces, curriculum workers thus could uncover the logic or emphasis in a given rationale for curriculum.

Accordingly, commonplaces have been utilized for curriculum inquiry to raise questions about assumptions of learners, consequently to examine beliefs about human nature and learning theory. For instance, are children perceived as naturally curious or resistant to learning? Do they construct knowledge or passively absorb information? Correspondingly, assumptions about content can be probed: Should content be perceived as flexible, evolving, or fixed? Should content be influenced by children's interests, the needs of society, or the demands of industry? Should it be arranged chronologically, thematically, or developmentally? Such questions also lead to inquiry about images embedded in the commonplaces, such as metaphors of learners as empty vessels, sponges, or inventors. Scholars call for such assumptions and images to be scrutinized so that stakeholders involved in curriculum can challenge their untenable assumptions and discover what beliefs they hold in common.

Since Schwab's and Connelly and Clandinin's depictions of commonplaces, recent scholarship suggests the benefit of this framework to help summarize complex arguments, to gain deeper understanding of a commonplace as portrayed by a particular curricular theorist, and to analyze curriculum for coherence by asking, for example, whether classroom environments are compatible with beliefs about how students learn. Other examples of curriculum scholarship using commonplaces include analysis of teacher narratives, teachers' self studies, and teacher-education practices.

## COMMON SCHOOL CURRICULUM

---

Arising in the 19th century, common schools were the first widely accepted model for free public education in the United States. Common schools derived their name from their curricular mandate: the common branches. A major purpose of common schools was to create a common U.S. people who spoke the same language, held similar values, and embraced a shared national identity. Although later writers sometimes ascribe an aura of homogeneity to the common schools, in truth there was considerable variation among the common branches across the country. This entry discusses the formation of common schools, how the curriculum was enacted in the classroom, forces that influenced curriculum content, and how issues from the common school era have influenced contemporary curriculum studies.

Thomas Jefferson dreamed of a system of free public education where a child with intellectual merit could rise above his family's poverty. Jefferson's ideal of free public education found a champion in Massachusetts's secretary of education, Horace Mann. Perhaps Mann's greatest accomplishment was the production of his highly influential annual reports. These reports were read across the nation and generated much discussion around the need for public education.

The shape of the common school curriculum was heavily influenced by faculty psychology, a version of educational psychology popular at that time. That school of thought held that each individual possessed faculties of the mind, body, and soul. Faculty psychology taught that the mind, the soul, and the body should be developed in a balanced way. Just as the physical muscles grew stronger through regular exercise, the other faculties also grew stronger through use. The mind was believed to possess the faculties of memory, imagination, and judgment.

As faculty psychology was translated into classroom practice, the concept of a balanced development of mind, soul, and body was lost. In practice, schools focused primarily on the mind and secondarily on the soul. What emerged was the method of mental discipline that stressed rote memorization over understanding or application. Complete sections of textbooks were committed

to memory. These memorized textbook narratives were then repeated verbatim to the teacher during a recitation session. As there were often 40 or more students per teacher and each child sometimes had a different textbook, each student spent hours memorizing alone and only a few minutes each day with the teacher reciting his or her lessons.

Because of the inefficiency of this mode of instruction, some elementary school students spent years going over the same material without being able to advance in their education even though they could have mastered it in a few months with different methods. The principle of thoroughness also shaped educators' thinking about what was appropriate to study and how to study it. Most educators of the 19th century believed children must complete their study of a subject before taking up another subject. Thus, most adults did not find it objectionable that children would study the same textbook sections repeatedly over the years.

From the perspective of the 21st century, it is easy to look back at the common schools and see homogeneity. However, although the common branches were the core of the common school curriculum, there was surprising disagreement, particularly in the early 19th century, as to what these common branches were. Reading was the one subject almost everyone agreed should be included in school. The primary purpose of early U.S. religious schools had been to teach children to read the Bible. Later, during revolutionary times, reading became important for keeping abreast of news and politics. Thus, the importance of reading as a subject in school was generally accepted. Similarly, moral-religious instruction was generally agreed upon as one of the common branches. However, as the population of the nation grew and diversified during the 1800s, the use of Protestant Christian values and sacred texts in the public schools became an area of controversy.

Many, but not all, common schools included writing and arithmetic as a part of their curriculum. Likewise, spelling classes and spelling bees were typical in most common schools. Some educators advocated reading alone; others promoted the three R's—reading, writing, and arithmetic. Still others felt there was room for literature, the sciences, history, geography, and more. In a time of

extreme curriculum fragmentation, some educators argued for separate classes in geology, chemistry, biology, and botany.

The individual teacher's preparation and preferences also shaped the common school curriculum. Teaching was often viewed as a short-term job rather than as a career. Formal preparation of teachers was virtually nonexistent. Most local school boards could certify any person they believed was qualified to teach. A teacher who loved literature might focus almost exclusively on reading and literature though a teacher with a like for history would emphasize that subject.

Over time, the common school curriculum developed by addition. As new segments of the U.S. people found and asserted their voices, new subjects were periodically proposed and added to the common school. But subjects were rarely eliminated. This increasingly fragmented and overloaded curriculum set the stage for elementary school reform efforts and the Committee of Fifteen.

Issues from the common school era still resound in curriculum studies. Back-to-basics movements have been birthed from the common school tradition. Advocates have promoted a return to the three R's, a core curriculum, or a classic curriculum. The debate over teaching method continues. Some emphasize the needs of the child while others focus on discipline-specific traditions. Issues of curricular control remain central to educational policy and practice. The use of critical theory traditions has added diverse perspectives to these discussions. Curriculum studies scholars seek to influence schools and educational practice through critique and activism.

## COMPARATIVE STUDIES RESEARCH

---

Comparative studies play an important role in current efforts to create a worldwide field of curriculum studies. A comparative perspective draws on empirical and theoretical research to expand curriculum studies beyond the traditional settings of the region and nation. As one approach in international education, comparative research aims to understand broadly educational practices and processes in a global context rather than promote a uniform or universal notion of the field. This entry explores the varied purposes of comparative studies within curriculum studies, the primary theoretical and methodological trends, and the existing infrastructure for future comparative studies.

### Impetus to Compare

Comparativists recognize that changes in global economics and politics help shape national education practices and policies. Globalization, in all its current forms, has made curriculum studies a field in which the national is in a dialectic with regional and international trends. Comparing curricular developments both within and among countries assists in understanding more fully the global movement of people and ideas, an essential component of what Janet Miller labels transnational flows and mobilities. As state curricula respond to the norms and expectations of supranational organizations, including those with a transnational scope, such as the European Union, and others with a global reach, such as the World Bank and United Nations Educational, Scientific and Cultural Organization (UNESCO), comparative research explores the possible development of global curricular norms and patterns. The development of international assessment examinations, such as the Organization for Economic Cooperation and Development's Programme for International Student Assessment and the International Association for the Evaluation of Educational Achievement's (IEA) Trends in Mathematics and Science Study (TIMSS) and Progress in International Reading Literacy Study, provide further grounds to examine the development of the possible convergence or homogenization of curricula. Comparative studies research also invites researchers to move beyond

the nation-state in framing curricular developments in regional, historical (e.g., colonial period), and religious perspectives. A study comparing Islamic education among the Francophone Hausa of Niger and the Anglophone Hausa of Nigeria, for example, would engage these three lenses with its historical perspective, its consideration of transnational influence of the British and French colonial educational systems, and its consideration of the impact on a relatively homogeneous population across modern political borders.

### Traditions of Comparative Studies

Comparative research incorporates a range of theoretical paradigms and methodologies, yet tends to cluster around distinct research approaches including policy borrowing and single-state historical and cultural studies, which are common within curriculum studies. The review essays of 28 countries in William F. Pinar's *International Handbook of Curriculum Research* provides a compelling example of this latter type of one-nation, comparative study. Theory development has unfolded internationally as well with intellectuals such as Brazil's Paulo Freire and Great Britain's Paul Willis contributing to the growth of a critical perspective on curriculum planning and resistance.

Quantitative approaches to cross-national comparative research gained momentum in the post-World War II era. Quantitative studies tend to examine the official or intended curricula, sometimes across tens of countries, through statistical surveys of policy documents, textbooks, legal frameworks, and achievement results. By the end of the 20th century, quantitative researchers had contributed to the development of a robust world culture theory suggesting the possibility of transnational and even global curricular convergence. Qualitative researchers contest that even in the case of curricular convergence, the enacted and appropriated curriculum varies widely within and across countries.

Comparative research, particularly of qualitative data, is particularly challenging. An individual must have sufficient language fluency and knowledge of the required contexts to make such a study viable, and few are able to work in more than a few languages. Large-scale qualitative comparison in particular requires international teams that

must reach consensus about the meaning of key terms and concepts that may have very different aspects and connotations in their own contexts. Innovations in qualitative comparison were a hallmark of the 1999 IEA study in civic education and in comparative video ethnography of mathematics in the third TIMSS study. Single-country studies dominate qualitative comparative research, which emphasizes the meaning making and processes of policy making, teaching, and learning. Drawing heavily on ethnographic approaches, recent comparative research on schooling has expanded in scope to multiple countries including Joseph Tobin and colleagues' three-country, diachronic examination, *Preschool in Three Culture Revisited*, published in 2009, and Robin Alexander's five-country analysis *Culture & Pedagogy*, published in 2001.

At least three major strands of inquiry have developed in the early 21st century comparative studies research, including the role and transformation of human rights and civic education across regions, the legacies of Eurocentric curriculum in postcolonial or settler societies (e.g., United States, Canada, Australia, and New Zealand) and the concomitant resistance to this approach, and finally, the processes and consequences of a global push for literacy and education for all as part of the coordinated international effort to promote universal primary education by 2015.

### Structuring the Future of Comparative Research

The exchange and deliberation of comparative and international research depends upon what Pinar labels the infrastructure for internationalization. Within curriculum studies, regional and international consortia and organizations regularly meet to conceptualize and debate the field from a regional and international perspective. At the regional level, groups such as the Pacific Circle Consortium have met for over 30 years to promote regional cooperation in the production of curricular materials. In Europe, the Consortium of Institutions for Development and Research in Education in Europe provides a network of educational institutes to work for curricular educational research. Globally, the International Association for the Advancement of Curriculum Studies and

the World Council for Curriculum and Instruction strive to bring scholars together across borders and theoretical orientations to encourage attention to global dynamics shaping the field. Journals within the fields of comparative education and curriculum studies reflect the growing significance and interest in comparative curricular studies. Special issues dedicated to the advancement of comparative research studies include the recent 2009 issue of *Journal of Curriculum Studies* with a focus on citizenship education curricula and *Comparative Education Review's* 2006 issue on Islam and education that captures the growth of a dynamic international and interdisciplinary field of curriculum studies.

## COMPETENCY-BASED CURRICULUM

---

Competency-based curriculum design is a model in which educative goals are structured to discover and support the unique abilities and learning styles of individuals, thereby facilitating the achievement of their potential. The concept is in keeping with many established paradigmatic perspectives in the field of curriculum studies.

In a competency-based curriculum, emphasis is not placed upon the learners' accumulation of memorized knowledge or behavior, but instead on their proficiency in a particular realm. A competency goes beyond a skill; it is not simply the learner's accumulated knowledge or task-oriented abilities, but rather the aptitude to produce a personally and socially valuable outcome. The goal of this construct is to help learners achieve long-term success through the realization and cultivation of their strengths and then apply those assets to make contributions to the greater social environment. With this intent, competency-based curriculum is well suited to foster creativity and critical thought in learners who may then choose to participate in and contribute to a democratic society. This curricular model is employed in a variety of educational settings in many venues around the world.

There are several key facets of competency-based curriculum. First, learners and teachers alike act as agents to determine the curricular activities and experiences included to best develop the learner's unique capabilities. These activities include, but are not limited to, relevant subject matter learning. There is a significant emphasis placed upon experiential learning and activities that allow learners to be submersed in authentic experiences and engage in critical reflection and self-expression. There is, too, an intent to foster enjoyable experiences and those that might serve to develop the learner's moral development. Because this model is focused upon specific learners and environments, assessment is developed to align purposefully with the curriculum and the needs of the learners themselves. Standardized and quantitative criteria are employed in relative moderation with a greater importance placed on performance-based, experiential learner outcomes.

The notion of competency is often rooted in the progressive stages of development associated with the adult learner developed by Stuart E. Dreyfus and Hubert L. Dreyfus in the 1980s. Although there are several iterations of the Dreyfus model, these stages always include the following: novice, advanced beginner, competent, proficient, and expert. Competency-based education is intended to scaffold the learners' achievement of the competent stage of development; it is then at the discretion of the learner to expand his or her degree of understanding to achieve higher levels of development.

The employment of the competency-based curricular model endeavors to educate all learners, regardless of their level of academic ability, to their fullest potential. It is the unique and individualized qualities of this highly engaged curricular model that lend its appeal to various realms of teaching and learning. Learner outcomes are adapted to facilitate the development of a variety of competencies depending upon the needs of the organization. For this reason, it is often utilized in disciplines outside of education.

For example, in recent years the Brown University School of Medicine initiated a competency-based curriculum, titled MD2000. This implementation was made with the hope that it would cultivate cooperative working relationships between teachers and learners as they work to achieve shared goals. It was also intended to provoke students to engage more actively to achieve their learner outcomes. Another example of the employment of this model exists in the field of business at Boise State University. In that venue, the employment of a competency-based curriculum is intended to ensure that learners do not simply accumulate knowledge or skills, but instead seek ways to employ their learning in a range of professional milieus.

As with other models prevalent in the field of curriculum studies, the adoption of a competency-based curricular framework necessitates a shift in thought pertaining to teacher and learning in many contemporary venues. Currently, many curricular paradigms employed in professional training venues are centered on the goals of the managing bodies; tasks and strategies are organized to simplify tasks and increase efficiency in the workplace. In contemporary public education in the United States, curriculum is squarely centered on standardized assessments in an institutionalized curricular model. Conversely, a competency-based curricular model necessitates a learner-centered, experientially focused process.

## COMPLEMENTARY METHODS RESEARCH

---

Complementary methods refers to the use of more than one method when a researcher seeks illustration, clarification, or elaboration about research findings. Complementary methods research permits curriculum studies researchers to use quantitative and qualitative methods in the same study as needed to garner deeper insights. This class of methods entered in the educational research community landscape in the late 1980s when Richard Jaeger published his textbook, *Complementary Methods for Research in Education*, under the auspices of the American Educational Research Association. This book was based upon a series of audiotapes in which a committee of researchers concerned about the overreliance of quantitative methods and their dominance in research publications sought to make a greater set of resources about methodological inquiry available to graduate students and instructors of educational research methods courses. The dominant role that quantitative methods once had played in educational research tended to overshadow the potential contributions and publications that verbal and visual forms of data collection and documentation held.

Many researchers treat epistemology and methods as though they are synonymous. However, differences in epistemological beliefs—that is, how knowledge is and can be known—does not have to be the basis for justifying the selection of methods. For example, if a qualitative researcher wants to utilize methods typically associated with quantitative methods to promote a deeper understanding of his or her results, adherence to a particular epistemology such as constructivism should not prevent this type of additional inquiry. The same is true for quantitative researchers who tend to hold the epistemology of objectivism. This belief should not prevent the researchers from

using in-depth interviews with achievement test takers whether they are also interested in how test-taker participation and achievement scores are related. Complementary methods is one way to overcome the chasm that has been artificially created by individuals who hold an allegiance to the epistemology of objectivism even though the research question may beg for inquiry using methods that are most nearly aligned with a constructivism epistemology.

In the last 20 years, the research community has expanded exponentially beyond the traditional ways of knowing to include gendered, poststructural, and indigenous ways of knowing and to different ways of addressing the complexity of phenomena through the use of multilevel, hierarchical linear measurement and structural equation modeling. The emergence of complementary research has heightened as the world and study of phenomena becomes increasingly more complex. In general, social scientists and specifically educational researchers are beginning to recognize that training students narrowly, for example, in only a single approach to conducting studies, such as conceptualizing problems from a political point of view, can significantly shape how they approach the study of problems. The issues surrounding the use of complementary methods are not limited solely to the fields of social science, educational research, or curriculum studies. The philosophical traditions of many fields of study such as medicine, dentistry, psychology, and history, among others, have been challenged by the use of complementary or alternative forms of inquiry. In educational research, the use of complementary methods such as qualitative research was subjected to considerable scrutiny and criticism by quantitative researchers for almost two decades.

The emergence of complementary methods has resulted in methods of inquiry that might have otherwise gone relatively unnoticed by graduate students and researchers. For some students, such forms of research have been illustrated by a conflict between epistemological beliefs and methods of inquiry. Students ask questions such as the following: What type of analysis should be done? How should the data be collected for the research questions that have been asked? How does the theoretical perspective shape the use of methods and data collection process?

For others, such as instructors, this type of inquiry has resulted in paying greater attention to the students' epistemological beliefs and their alignment with the theoretical perspective, methodology, and methods of their studies. Representative questions that have emerged from using complementary methods follow: How does the use of particular methods and the results that emerge reshape my understanding of phenomena? How can the use of other methods impact my understanding of the field?

Researchers need to be skilled in the use of multiple methods so that they have the capability to analyze questions using an interdisciplinary approach and the ability to mix methods. Researchers need to be able to utilize methods that permit macro- and microlevel analysis. Such an approach lends itself to an increased probability that research questions can be answered with increased precision and depth of insight. Developing skill within a broadened range of methods allows researchers to explore different dimensions of a particular research question. Having a familiarity with and skilled use in complementary methods is one approach to shaping future educational researchers.

## COMPREHENSIVE HIGH SCHOOL

---

The comprehensive high school is a unique U.S. concept, developed in the 20th century to meet the challenges of a changing society by designing programs to correspond to the educational needs of all youth. A confluence of forces influenced the rethinking of U.S. secondary education: industrialization, immigration, progressive educational theory, and the rise of vocational education. To

provide for equal opportunity and status of U.S. youth, public schools needed to provide general education for all citizens to help them contribute to and be part of the growing democracy; integrate new immigrants into the wider U.S. culture; ensure that students, upon graduation, were employable in an industrial age; and to provide for those students with abilities and talents to continue their education in the colleges and universities. Unlike the thinking in many European countries, reformers of education did not want to develop a dual educational system, but favored a unique unified system that would serve as a model of U.S. thinking and ingenuity that would meet U.S. needs, not European traditions. Thus, the new secondary schools not only needed to meet the academic needs of the students, but also as importantly, needed to meet the social and democratic needs of the country. Students of different backgrounds and abilities needed to learn how to function together to ensure that they had the skills necessary to keep the democracy moving forward.

The comprehensive high school had two major thrusts upon which to build their programs: a unifying aspect and a specialized aspect. Unification meant students would work together regardless of race, ability, ethnicity, gender, or skill to build school and community spirit. Specialization meant that programs would be provided to meet the various academic needs of the students, whether those needs were vocational, college preparatory, or special. Given these goals, the development and growth of the U.S. comprehensive high school was both exciting and fraught with many challenges.

John Dewey was one of the staunch supporters of the concept of the comprehensive high school. In *Democracy and Education*, Dewey recognized that the growing diversity of U.S. society due to massive waves of immigration demanded a restructuring of the schools to unite the internationalism of the population to one of nationalism, to maintain the integrity of the individual while facilitating social unity. He saw the public school system as the best means of unifying a diverse, heterogeneous population. He perceived that the structure of the comprehensive high school would allow the development of common understandings through various school activities and common academic curriculum while the specialized programs could meet the individual needs of each student.

In 1918, The Commission on the Reorganization of Secondary Education, a composition of several National Education Association committees examining secondary education, published the *Cardinal Principles of Secondary Education*. This report prefaced its recommendations with a summary of the key changes in U.S. society, in the high school population, and in educational theory. The report acknowledged that education in a democracy needed to take place within and outside of school and should ensure that individuals acquire the knowledge, skills, habits, interests, and powers to find their place in U.S. society. The report identified seven main goals of education: (1) health, (2) command of fundamental processes, (3) worthy home membership, (4) vocation, (5) citizenship, (6) worthy use of leisure time, and (7) ethical character.

The *Cardinal Principles of Secondary Education* described how the secondary school could accomplish these goals and became the guideline for the development of the comprehensive high school. The discussion of the curriculum provided both the unifying and specializing functions of the comprehensive high school: unification through curriculum constants that would be taken by all students, curriculum variables that would be determined by the students' individual vocational needs, and free electives to fulfill the special interests and aptitudes of individual students. By 1940, the comprehensive high school was the dominant model of secondary education in the United States. Although the model was popular, there were many questions as to whether or not it was fulfilling both the unification and specialization aspects of education it was designed to do.

With the launch of *Sputnik* by the Soviet Union in 1957, high schools became a target for criticism by politicians, educators, and the general public. James B. Conant's study in 1959 of the U.S. high school supported the comprehensive high school as the ideal model for U.S. education. Twenty-one recommendations for improvement were made, but the support was clear. However, the civil rights movement of the 1960s demanding equal access to quality education for all youth, and the growth in the 1970s of alternative schools to provide that access did not support the existence of the comprehensive high school. The assault on secondary education continued as the country tried to cope with the changing social, economic,

political, and academic demands of the public. A proliferation of books, reports, and legislation in the 1980s to 1990s demanded change in public education and by the end of the century, the comprehensive high school curriculum looked more like an academic college preparatory one rather than a curriculum that met the needs of all students. Comprehensive high schools can still be found in small communities, but the ideal model for U.S. secondary education has ceased to exist in most communities.

The comprehensive high school is a unique U.S. legacy whose time may come again as the issues of today are reflective of the issues 100 years ago when the comprehensive high school was created to provide equal opportunity and status for all U.S. youth.

## COMPULSORY MISEDUCATION

---

Compulsory miseducation is word play on a concept that was long considered a pillar of progressivism: universal compulsory education. In order to participate in social and economic and political life, reformers argued over decades and decades, all children, not just the privileged, should be granted access to learning, and all families, not just the enlightened, should send their youngsters off to school. This idea is now embraced the world

around. Indeed, the “UN Convention on the Rights of the Child” calls on all state parties ratifying the document to accept a standard of universal education through the elementary years.

Despite its progressive origins and resonances, the idea of compulsory schooling took a decidedly sinister turn in the hands of authoritarian state powers: Soviet schools were compulsory, as were German schools during the Third Reich. Compulsory education appeared to contain, then, possibilities in direct opposition to enlightenment and freedom; there was a distinct potential for mass indoctrination, herding and deceiving, disciplining and punishing, commanding and controlling. Even in putatively democratic countries, societies exhibited tendencies in their schools that had the distinct odor of totalitarianism: the old-school whip and isolation cell and all the modern technologies of despotism from mystifying and manipulative propaganda to mass spectacle and targeted scapegoating.

Paul Goodman, poet, prolific writer, engaged intellectual, and activist anarchist of the 1960s (as well as fatherly inspiration to that era’s student, peace, and queer movements), popularized the term with the publication of his work, *Compulsory Mis-Education*, in 1964. Goodman wrote on a wide variety of matters including education, Gestalt therapy, city life and urban planning and design, children’s rights, politics, literary criticism, and more. In an interview with Studs Terkel, Goodman noted that although he seemed to have a number of eclectic and divergent interests, they were in fact all one fundamental concern: How to make it possible to grow up as a human being into a culture without losing nature; he simply refused to acknowledge that a sensible and honorable community could not exist.

Goodman was the author of dozens of yeasty and germinal texts: *Growing Up Absurd* was perhaps his most famous best seller, but *Gestalt Therapy* invented the field, and *Being Queer* was a landmark in the emerging gay liberation movement of the 1970s. Goodman thought that it was pathological to be prevented from making love to someone of the opposite sex and equally pathological to be denied the experience of homosexual love. What he found obscene was the way society makes people feel shameful and criminal for doing ordinary and profoundly human things.

*Utopian Essays and Practical Proposals* and *Little Prayers and Finite Experiences* influenced a propulsive generation to think and act in new and liberatory ways. His critique of modern education was that it killed the spirit of youngsters and left them bereft of curiosity and creativity. Goodman described his politics as anarchist, his love as bisexual, and his profession as a man of letters, but many saw him as more even than that—he became in important ways the 20th-century Thoreau, the quintessential U.S. mind of his time.

## COMPULSORY SCHOOLING AND SOCIALIZATION: CASE LAW

---

Compulsory school attendance laws vary by state, but essentially require children to attend public school or receive an acceptable educational alternative. Controversy over compulsory schooling stems largely from tension between parental rights and the interest of the state. State governments have used compulsory attendance laws to promote a variety of social welfare efforts, and generally the courts have upheld the rights of the state in mandating education over challenges based on religious or personal freedoms. Scholarship in the field of curriculum studies has focused not only on the historical evolution of compulsory schooling case law, but also on the impact of social agendas on the curriculum. As mandatory school attendance laws evolved over the 20th century, curriculum scholars point to fundamental shifts in what was taught and who was taught in public schools.

Forced school attendance has played a critical role in accelerating broader social change. Child labor reform, public health programs, and the civil rights movement were dramatically affected by compulsory schooling legislation. Although mandatory attendance laws date back to the mid-19th century, it was not until the end of the 19th century that both child labor laws and compulsory school attendance laws started to gain significant momentum across the country. Child labor abuses, a changing economy, and massive immigration all served as the backdrop for more state regulation over the treatment and education of children.

Resistance against mandatory school laws was strongest in the South where the inevitable reduction in cheap labor that children provided was seen as a threat to the economy. Early child labor laws were in place throughout the country by 1912, but in many states, a work week of up to 60 hours was allowed for children as young as 12 years old. It was not until the end of the World War I that the last state (Mississippi) had enacted school attendance laws, and it was the two forms of legislation in concert with each other that dramatically changed the work life of children in the United States.

Mandatory schooling played a critical role in promoting the melting pot inculcation of U.S. culture, civics, and language. Explicit nationalism based elements of school curricula gained broad support after World War I. In *Pierce v. Society of Sisters of the Holy Names of Jesus and Mary* (1925), a case that limited the power of the state's compulsory attendance laws, the U.S. Supreme Court reinforced the power of the state to require good moral character of teachers and a patriotic disposition. Civic virtues and English language education were deeply embedded in public school curriculum. For example, in 1919 the state of Nebraska passed a law that barred any teacher, in a private or public school, from teaching subjects in any language other than English. The U.S. Supreme Court determined that the Nebraska law was unconstitutional in *Meyer v. Nebraska* (1923), and later Court opinions limited the ability of the state to homogenize learning opportunities for children.

The U.S. Supreme Court has long held that certain personal liberties can be sublimated to promote the general welfare and common health of a community. State-mandated health education programs, regular school-based checkups for hearing

and vision, lice checks, laws compelling teachers to serve as mandatory reporters of child abuse and maltreatment, and vaccine requirements are all examples of ways the state has worked through public schools to promote health initiatives. Vaccination requirements are of particular note in case law because they are a requirement for public school attendance. Courts have consistently supported state-mandated vaccination programs and the right of school districts to deny school admission to children who are not immunized. Even in the face of an established and documented religion's objections, courts have ruled that religious beliefs do not exempt children from legislation that reasonably protects public health. When students are not allowed to enroll in public school because of a refusal to be immunized, the responsibility then falls to the parent to provide an equivalent alternative education for their child.

Specific legal challenges that helped define the limits of compulsory schooling center on concerns of religious freedom and the rights of parents to provide education at home or through a private school. In 1925, a private school contested an Oregon statute that compelled all children ages 8 to 16 to attend public school. The Society of the Sisters of the Holy Names of Jesus and Mary contended that the new law would hinder their business and diminish the value of their property. In *Pierce v. Society* (1925) the U.S. Supreme Court ruled that although the state retained the power to reasonably regulate schools, they could not pass legislation that would arbitrarily or unreasonably interfere with the business or property value of private schools. Religious objection to mandatory schooling laws have been largely unsuccessful. The consensus of the courts for most of the 20th century had been that although children may attend private schools as an alternative to public schooling, they may not opt out of education altogether. However, in 1972 the Supreme Court established what has become known as the Amish exception in ruling that Amish children in Wisconsin need not continue their formal education beyond the 8th grade. In *Wisconsin v. Yoder* (1925) the opinion turned on three key issues. First, the well-established and documented tenets of the Amish beliefs were undeniably in conflict with the act of attending public school. Second, the value of two additional years of formal education beyond the

8th grade was decided to be less important when preparing a child for a separated agrarian community. Third, the Amish community has historically shown that they were a highly functioning society that had raised socially and politically responsible citizens without mandatory attendance beyond the 8th grade. The unique nature of the Amish exception severely limits the application of the *Yoder* precedent to other religious groups. Attempts by other religious groups to apply the Amish exception have been unsuccessful.

## COMPUTER-ASSISTED INSTRUCTION

---

Computer-assisted instruction curriculum may vary from drill on rote learning such as math facts to simulations of labs for high school advanced physics students. As technology has grown, computer-assisted instruction curriculum has become an important part of curriculum studies. The instruction via computer can be as varied and complex as the instructors that use computers to assist their instruction. In the 21st century, computer-assisted instruction is used in elementary and secondary school computer labs and in college distance education programs. Computers have made instruction in specialized areas available to all regardless of their geographic position. In fact, by 2008 the largest university-based PhD program in the United States was an online computer-assisted instruction program.

Computer-assisted instruction curriculum may be employed with a classroom of PreK–12 students in a computer lab or in a college student's home. Timing for the instruction also varies. Synchronous computer-assisted classes take place

where all students are logged into their course via computer simultaneously. In this type of computer-assisted curriculum, student participation in discussions may occur via live chat on a message board or with microphone and/or Webcams.

Asynchronous courses allow students the flexibility to choose the time that is best for them to complete coursework. Discussion with other students may occur via discussion boards, where students log into the course at different times and post responses and comments to questions from the instructor or in reply to other students' postings.

Most often computer-assisted instruction curriculum is designed and developed by the course instructor. Similar to other curricula in the field of curriculum studies, this type of curriculum includes the learning objectives, method of instruction, and assessment of the curriculum. The difference in computer-assisted instruction is working within the available technology. Sound principles of curriculum design are adhered to along with unique characteristics of computer-assisted learning. Typically, the curriculum is presented in an online format. In designing the curriculum for computer-assisted instruction and learning, attention is given to the model of pedagogy the instructor wants to follow for the curriculum, the instructional strategies to be used, and the learning technologies to be used.

In considering the pedagogy of computer-assisted instruction curriculum within curriculum studies many of the same models of teaching and learning that are adopted for a curriculum that does not have a technology component can be utilized in the computer-assisted instruction. Many pedagogies rely on social interaction in a face-to-face class. These social interactions can also occur in computer-assisted instruction. Learning communities are one of the most common social groups referenced in computer-assisted instruction and may take place through posting to Wikis or by utilizing a class management system such as Blackboard that allows for groups to be formed. Although one may first think of independent learning when thinking of computer-assisted instruction curriculum, the social learning communities can be an integral part of computer-assisted instruction if the instructor so desires.

Another type of pedagogy is one of information processing. In a face-to-face classroom, this form of instruction may consist of multiple lectures where students must process the information and fit it into

a framework of the course. This process is easily accomplished from a distance with computer-assisted instruction where students may watch a video of a lecture or view a PowerPoint presentation covering key concepts. Mastery learning for behavioral objectives can be programmed into software for computer-assisted instruction where students are presented information, assessed, and then have nonmastered concepts retaught and assessed again.

In the arena of instructional strategies for computer-assisted learning, a skillful course designer can incorporate group work, individual work, discovery learning, direct learning, and learning from simulations into computer-assisted instruction curriculum. One advantage of computer-assisted instruction is that students do not need to be in the same physical location to exchange ideas, view each other's work, or give peer feedback. Collaboration among students is made easy with technologies such as Elluminate and students using Skype can discuss issues using microphones and Webcams, creating a virtual classroom and making collaboration among students internationally possible. New technologies such as Voice Thread allow community storytelling, critical thinking, and even feedback for assessment. Voice Thread records audio, which is especially helpful for young children who are in the prewriting stage and for auditory learners of all ages.

Reflection is often done through journaling during the course of a face-to-face class. In a computer-assisted learning environment, students may create a blog where only the student and instructor are allowed to post. Problem solving is enhanced through the many resources available on the Web that can provide the needed information for a solution.

In higher education, research may take place in the virtual environment, accessing artifacts from libraries and museums that would be impossible for the student to access without computer assistance. At the elementary level, virtual field trips are another possibility that becomes more inviting as the cost of fuel increases.

Learning technologies utilized in computer-assisted instruction range from course management systems, to Web conferencing, blogs, Wikis, and electronic portfolios. Through skillful use of these technologies, the instructor can create a course with multiple interactions including learner to learner, learner to instructor, instructor to learner,

learner to content, learner to small group, and learner to large group (class).

New technologies continue to broaden the definition of computer-assisted instruction curriculum. One such new technology is Mashups. Mashups utilize more than one Web-based content source. This application can be used for instruction in map concept curriculum. Instructors have combined Web-based maps with other Web-based applications to create a visual walking route. Primary students can map their neighborhood, and a high school health class can add a calorie counter to see how many calories are used when walking the route. Geometry is also easily done with Mashups where students click points on a map and area is calculated.

Although computer-assisted curriculum may seem avant-garde, technology is servant to the curricular goals and purposes. A broad knowledge of curriculum studies is needed to design premium computer-assisted curriculum. Although the technology is new, as in Voice Thread, the basic curriculum premise is not. John Dewey advocated attending to student voice in the early 20th century, demonstrating that inclusion of student voice in the educational process is a foundational part of curriculum studies.

## CONCEPTUAL EMPIRICIST PERSPECTIVE

---

Conceptual empiricism is one of the many perspectives that exist in the field of curriculum studies.

This perspective employs the conceptual and empirical work in studying the fields of curriculum and education, as opposed to the traditional approach that was devoted simply to the development of programs of study. Conceptual empiricism represents the influence to the curriculum field from the social science researchers and academics who believed that conceptual and empirical research could evoke significant outcomes in education and thus, in classroom practice. Up to that point, and in the beginning of the 20th century, the curriculum field served primarily the areas of education connected to the narrow term of schooling, namely administration, teaching, and design and development of programs of study. The subsequent expansion of the field to draw upon disciplines from the arts, humanities, and social sciences resulted in the examination of larger educational forces and their effects upon the individual, society, and the purpose of knowledge, all of which relate to curriculum.

Seeing research in education as germane to social science research signified the departure from the traditional perspective that was connecting curriculum mainly to schools and the work of school practitioners. This departure was also indicative of the perception that education is not a discipline in itself, but an area to be studied by other disciplines, such as social science. Social scientists, instead of accepting uncontested opinions, began developing hypotheses, what they viewed as logically justifiable content, the conceptual, and testing them in a way they would do in social science—that is, collecting empirical data.

The term conceptual empiricist was coined by William Pinar in 1975 in his *Curriculum Theorizing* edited volume. The perspective coincides with the many changes within the field, changes that Pinar and his colleagues in their book in 1995 characterized as a paradigm shift. This was seen as a demanding shift in the field, followed by the comments of scholars Joseph Schwab, Dwayne Huebner, and Pinar who in the beginning of the 1970s characterized it as moribund, dead, and arrested. Pinar elaborated the conceptual empiricist idea in his article “The Reconceptualization of Curriculum Studies.” One of the elements that signified the crisis in the field was the lost prestige of the traditional field, which was based on the Tyler Rationale, a rationale that had started losing recognition as it

was seen as too technical and procedural, excluding political and ethical concerns. Also, declining enrolments, increase of the educational administration and the educational psychology departments, and the induction in schools of subject matter specialists inclined toward the triumph of the conceptual empiricist curriculum paradigm.

The conceptual empiricist paradigm as identified by Pinar has also been acknowledged by other scholars who paid close attention to the contribution of science into the curriculum. This paradigm is closely related to William Schubert's social behaviorist orientation to curriculum. Social behaviorism advocates that science and technology become the basis of the curriculum. Curriculum design needs to be approached by applying the knowledge that derives from scientific educational research and that is conducted by educational and applied researchers. Skills must be developed via the careful design and the operationalization of what must be taught and learned, which should be done by conducting systematic investigation of what it takes to be successful in a particular society and instilling the kinds of behaviors identified.

Yet the role of science and research in curriculum as viewed by social scientists has been contested by Schwab's theoretic paradigm. Schwab in "The Practical: Arts of Eclectic" puts an emphasis on research, but at the same time goes farther to say that theories are good to possess, but it is also valuable to know how to apply them in practice. This turn in the field of curriculum studies as a result of the conceptual empiricist paradigm was significant for the expansion of the notion educators, researchers, and scholars carry for curriculum and for the importance of acquiring valid and appropriate information for the advancement of curriculum and instruction.

## CONSCIENTIZATION

---

The Brazilian educator and activist Paulo Freire coined the term *conscientization* in working with illiterate adults in poor countries. It is a translation from the Portuguese term *conscientização*, referring to the process of critical consciousness raising in which learners develop a deeper understanding of the forces operating to shape their lives and their capacity to act in ways to change that reality.

In curriculum studies, conscientization refers to a learner moving toward a higher level of consciousness by becoming aware of how larger social, economic, cultural, and political forces operate to make things the way they are. Freire claimed that societies and individuals become dependent and are kept that way through a culture of silence.

The way out of dependency is through dialogue. Liberation comes about through individuals refusing to regard themselves as recipients and regarding themselves instead as active agents capable of transforming themselves through changing the circumstances in which they exist. It is the severing of this dependence, or as Freire termed it, existing in the world, that makes humans different from animals and that enables humans to transcend or transform the world by being with the world.

Because human beings have this reflective capacity, or the ability to think about how their circumstances are determined or shaped for them by others, then it is this quality that gives them the capacity to create explanations that liberate them. For Freire, it was the inseparability of consciousness of and action upon that makes humans the kind of relational beings they are. Humans act on the world in a reciprocal way. Although they are conditioned and presented with defective explanations, humans also have a capacity to recognize that they are being conditioned. Through the capacity for critical consciousness, people become

functionally literate in the way they read the word while also becoming politically literate through reading the world—they question how the world came to be the way it is, they ask what keeps it that way, and they act on the world to make it more democratic. The essence of conscientization lies in the extent to which learners through the curriculum engage with and are prepared to problematize the world—that is, to not take it for granted, but to call it into question. This is a very different activity than problem solving, which by comparison, is a technical activity.

Conscientization is brought into existence in curriculum studies through the way teachers, especially in poor countries and communities, work with communities to generate lists of words that have particular relevance to people's lives. These generative themes, as Freire termed them, become the basis for dialogic discussion between teachers and learners in culture circles in which the meaning of words is explored prior to their presentation in symbolic or word form.

Although conscientization emerged out of the extension work Freire did with agricultural workers in Latin America, it may not translate easily into curriculum studies in advanced countries such as the United States. Conscientization has its greatest applicability not so much in terms of application as a method, as much as a big idea with which to infuse and inform the way curriculum issues get to be framed or thought about in Western countries. For example, several highly pertinent aspects include the following:

- *dialogical learning* or regarding teaching and learning as not being monological or unidirectional, but rather involving dialogue between learners and decentered teachers
- *locating learning historically* by recognizing that learning occurs in a context where learners have the right to ask the question, why am I learning this?.
- *puncturing hierarchy* and the idea that only experts can know and that learners are supposed to be passive recipients. In this respect, democracy is not so much taught as lived.
- *confronting mechanistic modernization*—that change is technical in nature and can be imposed without the involvement of the people it is supposed to benefit
- *rejecting short-termism* or the view that learning is about reaching achievement levels to the exclusion of long-term struggles over ideas of domination and control
- *highlighting the crucial importance of action* and the notion that thought and action without one another are empty and meaningless

There can be no better summation of what conscientization means than in the title of Freire's essay "Education as the Practice of Freedom." Curriculum studies is committed to liberating students from oppressive regimes of knowledge and hence the importance of conscientization to this field.

## COOPERATION/COOPERATIVE STUDIES

---

Cooperation was a distinctive educational concept in the field of curriculum during the 1930s and 1940s and much different from today's practices of cooperative learning. The term manifested itself in the classroom as cooperative planning and teacher-pupil planning, in student assessment as cooperative educational records, and in research and school reform as cooperative study. Cooperation and cooperative studies embraced a democratic ideal that participants would work together for a greater good and would maintain a fundamental belief (and faith) that a diversity of perspectives, coupled with open discourse, would serve to better disseminate information as a way to solve problems.

Although no structured format or unified theory was developed, the practice of cooperation included a focus on problem solving, the workshop, and the use of implementative research.

The concept of cooperation, though a component of a progressive education ideal of democracy as a way of life, was focused on problem solving and served as a method to attend to achieving already defined goals. Thus, if a school wished to encourage students to become more involved in their own education, cooperation became a method of curriculum development and took the form of teacher–pupil planning where students would become engaged, thereby overcoming the problem of lack of student involvement. Or if educators viewed the purposes of secondary education as in need of revision, a cooperative study project would be established where a group of faculty from varied school settings would come together to examine high school curricula and to discuss and describe ways in which programs could be improved. The defined problem—the need for revision—served to focus the group discourse, and the concept of cooperation permitted expansive and differing approaches that would be considered by others participating in the project. Solutions to problems were not determined and then disseminated to the group, nor did cooperation embrace a conciliatory conception of democracy as giving everyone their say or as compromise. Cooperation represented more of an emphasis upon collaboration and the importance of open discourse.

The workshop served as the social structure for cooperation where large, diverse groups of educators would come together in a setting not for lectures, but to work on developing solutions to identified problems and to explore and exchange possible approaches to similar issues. For national and regional cooperative study projects, workshops could last from 1 to 6 weeks. The cooperative study became a popular method of school experimentation in the 1930s and 1940s and defined a unique form of research for the field of curriculum—implementative research—distinct from the popular and most common status study research (a survey to document current practices), the deliberative study research (a gathering of data to support normative recommendations for educational change), and the traditional controlled scientific research. Implementative research tested no formal hypotheses, upheld no specific models to be implemented

and evaluated, and established no set of predefined outcomes. Rather, this type of research, as it was practiced in national cooperative studies, embraced a determined faith in experimentation as an exploratory process to include gathering, analyzing, interpreting, and discussing data for the sole purpose of improving educational practice. Similar to contemporary forms of design research, cooperative studies sought not to prove hypotheses with (today's) conventions of validity and reliability, but to determine and then implement solutions to problems as a form of cooperation and cooperative study.

The Progressive Education Association's Eight Year Study (1930–1942) is the most well-known example of cooperative study, with 42 high schools and 26 junior highs directly involved in reexamining the purposes of secondary education. This project initiated other cooperative school study projects during the 1930s and 1940s: the Cooperative Study in General Education (1939–1945) involving 25 colleges that engaged in the development of their undergraduate general education programs, the Secondary School Study (1940–1947) consisting of 17 Black high schools in the South defining curriculum and instructional progressive practices, the Southern Study (1938–1945) involving 33 White high schools in the South engaged in curriculum design and development, the Michigan Secondary School Curriculum Study (1936–1948) with 133 high schools in the state revising general education and the use of the Carnegie Unit, and the California Study of Cooperating Schools (1934–1939) with 11 high schools experimenting with curriculum design and development. The term *cooperation and cooperative study* changed in conception during the 1950s, in part due to the passage by the U.S. Congress of the Cooperative Research Act of 1954. Cooperative learning was rediscovered during the late 1980s and has evolved into a highly structured, instructional practice widely used in online, distance education settings.

## CORE CURRICULUM

---

As a prominent professional term in the field of curriculum studies, core curriculum has served as one of the classic battlegrounds for the struggle for the U.S. curriculum. The term came to represent the common knowledge most important for all students. Serving as a curricular response to the perennial dilemma, what knowledge is of most worth, core curriculum has been known by various terms: stem course, unified studies, integrated studies, common learnings, cultural epoch program, broad fields core, and general education. Core curriculum was even described as a slang term by staff of the 1930 to 1940s Eight Year Study. Although the term has appeared in postsecondary curriculum literature, its primary use in curriculum design and development emerged at the secondary and middle school levels. At the elementary school, core curriculum often becomes synonymous with the activity movement. Although the term is typically placed in juxtaposition with specialized education, core curriculum is used in a multitude of ways, as a conceptual structure for an individual discipline or for efforts to integrate areas of study.

Core curriculum is somewhat distinguishable from the concept of general education in that certain curricular and educational beliefs are embedded in the idea of core. Foremost is the fact that the core curriculum is considered a constant and required component of the curriculum, yet the accompanying restrictions of a requirement are lifted and replaced by a conception of basic and fundamental rather than required. Unlike contemporary uses of block scheduling, core curriculum was conceived as being in constant evolution. Its orientation saw learning as a series of integrated experiences without weakening disciplinary knowledge, drawing upon resource units, and incorporating the instructional method of teacher–pupil planning.

In what proved to be the most comprehensive conception of core curriculum, Harold Albery identified five core designs, placed on a continuum representing ever-increasing divergence from the

traditional subject-centered, general education program. Each core design, Albery maintained, could be viewed as the most effective configuration of education experiences to provide common preparation for democratic citizens; none was necessarily better than another. A Type 1 core program reflected a separate subject design, representing a traditional general education program consisting of a set of independent courses or fields of knowledge, sometimes taught by the same teacher, but typically taught by content specialists. Under this model, by far the most common, students enroll in English, history, science, mathematics, the arts, and physical education courses to fulfill a set number of Carnegie Units. Type 2 core involved the correlation of multiple subjects, most often English and history. Within this design, instructors responsible for two or more required subjects emphasized interrelationships among the content fields. For example, students studying the U.S. Civil War in their history class may read *The Red Badge of Courage* or *The Killer Angels* in their English sections. To facilitate instructional planning, sometimes an overarching theme might be selected, such as the sorrows of war. In a Type 2 core, the subjects are taught at separate times and in separate classrooms, but teachers would make links whenever possible, similar to today's arts infusion program.

For Type 3 core programs, two or more subjects are fused. Originally, social studies represented this design where history, economics, political science, and sociology were intertwined; however, social studies has now taken on a disciplinary designation in its own right and is considered a self-contained subject rather than a fused program. A more current example can be seen in hip-hop curriculum where traditional subject lines are softened, sometimes obliterated, and a new scope and sequence involving the unified subjects is developed. Those traditional basic content areas such as English, math, and science, which defined Type 1 and 2 core programs, are discarded as an organizational framework for a Type 3 core, but subject matter from these disciplines is consciously retained and balanced.

A Type 4 core is configured around a problem areas design. Although still drawing from the traditional disciplines, the Type 4 core determines its basic direction from the common needs of the

learners. Subject matter is selected based on problems rather than on balancing a predetermined amount of content, as would have occurred in Type 1, 2, and 3 core programs. The Type 4 core is also grounded in a fundamental belief that general education should assist students to identify and meet their common needs and directly confront their shared problems. Academic content was central to addressing these aims; however, no predetermined amounts and proportions were designated. Of the five program types, the Type 4 core was Alberty's preference at the secondary level, becoming a focus for much of his professional career.

Type 5 core represented a final and logical extension of the framework. Alberty found Type 5 core programs limiting, but the design attracted champions among the 1960s romantic critics. The curriculum is built around teacher–student planned activities without reference to any formal structure. Problem areas and other organizational forms gave way to the plans set by the teacher and students, and the curriculum unfolds as interests develop and opportunities present themselves. In practice, Type 5 core design usually involves some cooperative effort to establish standards for determining worthwhile topics or units for study. Afterward, when a schedule is examined of what had been done during a term, the program of study would be revealed.

When discussing common learnings, then as now, Alberty's core types help to frame the role of the disciplines. Inclusiveness was the goal of Alberty's framework: All conceptions of core curriculum and secondary general education were represented, from crossing disciplinary boundaries to maintaining traditional subject designations and from extending class time in order to explore issues to improving conventional Carnegie Units–based courses in standard periods. For Alberty, core teachers could be unified in their efforts for curricular reform, even though the degree of curricular integration would vary substantially across programs. Yet Alberty's broad use of the word *core* prompted criticism because his framework allowed for programs to be based upon separate subjects. Holding a more ideological view, Roland Faunce and Nelson Bossing argued that freedom from the traditional disciplines was one of the distinctive aspects of the core curriculum (as well as an emphasis upon group problem solving, guidance, and block scheduling). They came to term

these components as the real core or as the modern core idea in contrast to Alberty's configuration.

## CREATIONISM IN CURRICULUM: CASE LAW

---

Creationism teaches that life, and the universe in general, originated in the purposeful action of a being who existed prior to the origins of a created universe. The highly publicized 1925 trial in *Scopes v. Tennessee* did not establish case law precedent for deciding more recent cases on the teaching of creationism. Two U.S. Supreme Court decisions have established controlling precedents on certain questions, and lower court decisions extend those principles to questions that have emerged in other cases.

In *Epperson v. Arkansas* (1968), the Supreme Court ruled that an Arkansas statute prohibiting the teaching of evolution was invalid because it unconstitutionally required curriculum to be tailored to particular religious beliefs, in violation of the First Amendment's establishment clause.

In 1987, the Supreme Court held in *Edwards v. Aguillard* that Louisiana's statute calling for a balanced portrayal of creation-science and evolution-science in the state's public schools violated the establishment clause. The Court found that the statute's ostensible purpose of promoting students' academic freedom was belied by evidence that it was in fact motivated by religion.

The Supreme Court's reasoning in *Edwards v. Aguillard* drew substantially from the opinion by

the federal district court judge in *McLean v. Arkansas Board of Education* (1982), in which the court struck down an earlier attempt by the Arkansas legislature to require balanced treatment for creation-science and evolution-science in the state's public schools. In this case, the judge used a set of criteria for what qualifies as science in reaching the conclusion that creation-science does not meet the criteria and therefore is not really science.

Following *McLean* and the two Supreme Court opinions, the most recent landmark decision was issued by the federal district court in *Kitzmilller et al. v. Dover* (2005), which determined that intelligent design theory is essentially just another form of creationism and subject to the same establishment clause analysis that had been applied to the teaching of creationism in the prior cases. Based on extensive evidence and analysis, the judge concluded that intelligent design is merely a relabeling of creationism and is not a scientific theory.

The impact of *Kitzmilller* could be seen almost immediately in the resolution of *Hurst v. Newman* (2006), in which Americans United for Separation of Church and State was representing plaintiffs challenging an elective high school course on intelligent design. Without a trial, the case was settled within weeks of the *Kitzmilller* decision, with the El Tejon California school district joining in a stipulation that its schools would never again offer any course that promoted or endorsed creationism, creation science, or intelligent design.

In some localities, school boards have attempted to use disclaimers to warn students against being unduly influenced by the evolutionary theory in their textbooks. A federal district court in *Freiler v. Tangipahoa Parish Board of Education* (1997) ruled against the policy of a school board in Louisiana that ostensibly promoted critical thinking by requiring teachers to read a disclaimer warning students against being dissuaded from believing in the Biblical concept of creation. Finding this policy to be unconstitutional under the Establishment Clause, the court also recognized intelligent design as being equivalent to creation science for purposes of constitutional analysis.

In Georgia, the Cobb County school board adopted a policy of attaching stickers to textbooks warning students against uncritical belief in evolution, which students were to be told is a theory, not a fact. The federal district court rejected this

policy on establishment clause grounds in *Selman et al. v. Cobb County School District et al.* (2005). The school district appealed that ruling, but after *Kitzmilller*, they agreed, in a settlement, not to disclaim or denigrate evolution, either orally or in written form.

Case law has also been established for situations in which teachers or others claim that the teaching of evolution but not creationism violates their individual rights. The Seventh Circuit Court of Appeals ruled in *Webster v. New Lenox School District* (1990) that a teacher's free speech rights were not violated when the district prohibited him or her from teaching creation science. The Minnesota Court of Appeals affirmed a state court's decision in *LeVake v. Independent School District 656, et al.* (2001) that its case law supports districts in requiring their teachers to teach the district's curriculum and that a biology teacher has no countervailing free speech right to teach evidence both for and against the theory of evolution. The court also rejected the contention that the district policy unconstitutionally discriminated against LeVake on the basis of his religious beliefs. In *Segraves v. State of California* (1981), a California court rejected a parent's claim that class discussion of evolution violated his and his children's free exercise of religion. The court ruled that the antidogmatism policy in the State Board of Education's *Science Framework* did provide constitutionally sufficient accommodation to the religious beliefs of those who do not believe in evolution. The antidogmatism policy has since been extended to all areas of science, not just those concerning evolution.

## CRISIS IN THE CLASSROOM

---

Written for both the professional educator and the layperson, *Crisis in the Classroom: The Remaking of American Education*, published in 1970, brought national attention to the problems of schooling and introduced the term *mindlessness* that quickly became a common criticism of educational programming. Charles Silberman's critique of the (repressive) elementary school curriculum was surpassed by his assessment of the secondary school program—a curriculum that instilled passivity and conformity—and that of the middle school or junior high, which he described as a wasteland of U.S. education. From the perspective of curriculum studies, educational programs were called upon to achieve more than relevance and high test scores. Silberman captured the attention of U.S. society with the thought and hope that a public dialogue (in a Deweyan sense free of economic and political

maneuverings) would lead to common purposes and to action from students, parents, teachers, administrators, professors, and the general public.

Although it is often noted that the author was a professional journalist rather than an educator, Silberman was well versed in educational theory and history and had previously prepared an education report on cognition and the psychology of perception with Jerome Bruner as a research associate. Lawrence Cremin, after seeing this research report, brokered support from the Carnegie Corporation to establish the Carnegie Study of the Education of Educators so that Silberman could examine the many educational influences of society (and not focus just on schools). Yet *Crisis in the Classroom* did ultimately focus on education as practiced in schools, to the dismay of the Carnegie Corporation. The publisher, Random House, sold the first year serial rights to *The Atlantic*, which named the featured series “Murder in the Classroom” (a title that Silberman, in 2006, said that he would not have approved). This publication, along with a Sunday *New York Times* feature article, turned Silberman's book into a topic of national interest.

Based on 4 years of intensive travel and research, occurring between 1966 and 1969, Silberman produced a best selling publication at over 550 pages. He described the publication as an indignant book and portrayed schools as wastelands and grim, joyless places. Unlike the Conant Report, released 11 years before, Silberman's assessment did not arise from empirical data or surveys. His scholarship, qualitative and historical in nature, drew strongly upon the professional literature, his observations, and assistance and guidance from many of U.S. leading educational researchers and scholars: Cremin, David Riesman, Lillian Weber, Vito Perrone, Philip Jackson, Christopher Jencks, Lee Cronbach, and others. With Silberman's periodic anecdotes, vignettes, and facts from his studies scattered throughout the publication, he showed promise for change and did not lay blame for the national crisis on school administrators and teachers, a point that resulted in support from elementary and secondary school teachers.

*Crisis in the Classroom* offered suggestions for structural and curricular reform without adopting the tone of the deschoolers and romantic critics. Combining Deweyan general education-core

curriculum with practices of the open classroom and informal infant schools, Silberman searched for tenable middle ground to change high schools by humanizing and experimenting with curriculum and instruction. Such recommendations, although viewed as commonsensical today, reflected a powerful antidote for the remaking of U.S. education after accounts of repressive, petty school rules, and intellectually and aesthetically sterile settings where a lack of civility and unconscious contempt for children, according to Silberman, was commonplace. At the elementary school level, Silberman introduced and popularized to a U.S. audience the British open classroom (where he drew a very distinct line between his suggestions and that of the deschoolers, John Holt, Paul Goodman, and others).

Silberman offered hope for school reform and refused to attack professional educators cavalierly; his criticisms of U.S. education were supported by a new generation of teachers who were equally frustrated with the system. Silberman made a point of underscoring that most teachers and administrators were intelligent and caring individuals who sought the best for their students. Yet the entire educational system, as well as all of society, suffered from a mindlessness—an unwillingness to examine basic purposes of education and to question accepted school practices. *Crisis in the Classroom* proved so significant to educators that the National Society for the Study of Education published a collection of reactions and reviews to the work along with a response by Silberman. With essays by John Mann, Maxine Greene, and others, *Crisis in the Classroom* took on the tone of a national phenomenon, bringing attention to the problems of schooling for both the professional educator and layperson.

## CRITICAL PEDAGOGY

---

Critical pedagogy looks at schools in their historical context as dominant social, cultural, and political institutions rather than as sites of social mobility, recognizing how schooling reflects an asymmetrical distribution of power and access to resources based on race, class, and gender. Although there is a great deal of debate around the founders, terminology, and implementation of critical pedagogy, critical pedagogues are united by their commitment to social transformation for the collective good. Critical pedagogy is a fluid and transgressive discourse and practice in which people continuously redefine the world through the contexts in which they find it. Its introduction into curriculum studies has served to redefine the field.

Critical pedagogues strive to understand the world as it is and as it should be through problem-posing dialogue, a method that dissolves the teacher-student dichotomy and transforms all learners into agents of social change. The assumption is that through self-reflective thought and action—or critical praxis—a group of learners will problematize and openly legitimize or challenge their experiences and perceptions in an environment that is essentially unfree with contradictions of power imbalances in order to find their own truth and to create a better world in the image of that truth.

The roots of critical pedagogy are deep and far reaching. The first textbook use of the term critical pedagogy is found in Henry Giroux's *Theory and Resistance in Education*, published in 1983, and the most recent North American scholars of critical pedagogy include Peter McLaren, Ira Shor, Michael Apple, Antonia Darder, bell hooks, and Ernest Morrell. In North America, individuals shaping critical pedagogy included Frederick Douglass, Sojourner Truth, W. E. B. Du Bois, Booker T. Washington, John Dewey, Leonard Covello, Harold Rugg, Septima Clark, Myles Horton, and Charles Cobb. More specifically, Dewey's work linking individual and cooperative

intelligence with the discourse of democracy and freedom helped critical pedagogy evolve. In Latin America, Brazilian educator Paulo Freire is considered one of the most influential critical pedagogy educational philosophers, but the Latin American family of critical pedagogues also includes Simón Rodríguez, Simón Bolívar, Anisio Teixeira, Abidias Nascimento, Moisés Sáenz, José Vasconcelos, and Che Guevara, among others.

Freire's seminal work, *Pedagogy of the Oppressed*, expanded upon the work of other key influences to critical pedagogy, including the Frankfurt School, Antonio Gramsci, and Michel Foucault. The Frankfurt School was officially established in 1923 in Germany and included Marxist and Jewish philosophers such as Max Horkheimer, Theodor Adorno, and Herbert Marcuse. The school was the ballast of critical theory used as a tool against domination of all forms and a key influence to critical pedagogy. Beyond Europe, African thinkers also directly impacted critical pedagogy and included Julius Nyerere, Amílcar Cabral, Franz Fanon, and Kwame Nkrumah.

Critical pedagogy envelopes numerous philosophical principles from a variety of intellectual traditions and due to the evolving nature of critical pedagogy, it would be impossible to create an exhaustive list of such principles in this entry. However, the following serve as a starting point for those interested in learning more about critical pedagogy. First, critical pedagogy is fundamentally committed to creating an emancipatory culture of schooling that empowers marginalized students. Second, critical pedagogy recognizes how traditional curricular programs work against the interests of those students who are most vulnerable in society by reproducing class differences and racialized inequality. Third, it is understood that educational practice is created within historical contexts. Thus, students must strive for agency by first recognizing how they are subjects of history and then understanding how they can be self-determined to create history. Fourth, critical pedagogy supports a dialectical perspective that recognizes how all analysis must begin with human existence that involves the interactive context between individual and society with theory and practice as coexistent. Critical pedagogy therefore provides students and teachers the space to achieve emancipation through educational practices that

allow people to acquire, analyze, and produce both social and self-knowledge.

The last 20 years have seen an explosion of writing about critical pedagogy in both theory and practice of curriculum studies. For example, Ernest Morrell has written from the role of critical pedagogue–teacher–researcher who pries theories away from academics and incorporates them in educational practice through engaging students in critical research related to popular culture to facilitate the development of academic and critical literacies, thus joining his students in their counterhegemonic fight against unjust schooling practices and social structures. Others have focused on introducing critical and feminist pedagogies to beginning teachers while exploring action research in their own classrooms as a means to discover more effective educational practice. Furthermore, researchers have examined critical pedagogical practices in specific learning contexts including inservice learning programs, English language learning, computer-mediated communication, and community–university partnership-based organizations.

Critical pedagogy is often critiqued for its adherence to one absolute Truth, grounded in modern philosophical traditions, rather than multiple subjective truths arising from diverse standpoints. Some believe that not only the means, but also the ends are far too tied to Western epistemologies, and originally, critical pedagogy was critiqued for being dominated by White male scholars. More recently, critical pedagogy's inclusivity of more varied perspectives can be critiqued as nebulous, though some believe its dynamic nature provides for too rapid an incorporation of new ideas. Edward Said has argued against inversion—which he claims is tied to the imperial contexts from which they arose—therefore critical pedagogy's inversion of education for social reproduction to education for liberation is often criticized as reactionary. Other educators have critiqued critical pedagogy for its absence of a theory of learning and its weakness in discussing the cultural and social practices of any given community of learners. Interestingly, such critiques have not weakened critical pedagogy, but instead have been incorporated into its focus on conversations that promote growth. Overall, critical pedagogy continues its path of amelioration.

## CRITICAL PRAGMATISM

---

Critical pragmatism evolved from the need for a critical revision of pragmatism, which was held in low regard by many philosophers, especially in Europe. One of the contributing factors for the need was the lack of structured and identifiable standards and procedures allowing for rational and reflective practices in pragmatism. Critical pragmatists view the curriculum as the vehicle with which schools can bring about the desired social changes for the advancement of the community. To achieve this goal, curriculum developers must understand and appreciate the main premises of critical pragmatism.

In pragmatism, Charles Sanders Peirce's maxim is the requirement of clarity of meaning while critical pragmatism requires the validity of meaning as well as clarity; in other words, critical pragmatism asks whether the knowledge will mean the same for different people in different contexts. Cleo Cherryholmes in his book, *Reading Pragmatism*, argued critical pragmatists should examine their thoughts and actions in terms of imagined outcomes. He asserted that critical pragmatists attempt to examine their actions in relation to history and power, and as a result, critical pragmatists reinterpret their goals in light of theories and beliefs to form new goals.

Critical pragmatists view knowledge as the manifestation of understandings of the relationship between theory and practice. To the critical pragmatists, theoretical and empirical knowledge have to be embedded within practical reasoning to be of

value. Pointedly, critical pragmatism attempts to make sense of knowledge in the context of the real world. To the critical pragmatists, the focus should be placed on the clarity and validity of the meaning of empirical and theoretical knowledge.

Critical pragmatism reconciles pragmatic and critical pedagogies in a comprehensive approach. Pragmatic pedagogy contends that students should be taught the knowledge and skills that will prepare them to function in the society. In essence, the curriculum has to be learner centered, which focuses on improving students' abilities of problem solving to advance in the existing society.

On the other hand, critical pedagogy asserts that students should be encouraged to critique the existing educational practices and suggests changes that will improve the educational system and in turn the community. In other words, the curriculum needs to have a learner-centered approach that focuses on the students' critical skills to analyze and evaluate the current society, identify its ills, and develop solutions to change such society to the better. It is important to note, however, that critical pragmatists acknowledge the need to teach fundamental knowledge and skills while giving students the choice to chart their path as they learn.

Alison Kradlec, in her 2007 book *Dewey's Critical Pragmatism*, argued that Dewey's pragmatism was critical because it was focused on the use of interdisciplinary research and practical field experiences to examine and critique the socioeconomic and cultural factors that result in the pervasive inequalities in U.S. society.

These ideas have significant ramifications for curriculum studies and development. In critical pragmatism, the curriculum has to afford students the tools to better understand the social and economical factors that lead to the current structure of the society through the implementation of thematic, interdisciplinary problem-based curricula in the schools. Colleges of education have to train future teachers on the development and delivery methods of such curricula. Schools have to foster learning communities that empower teachers to implement such curricula.

According to Kradlec, two essential prerequisites for critical pragmatism are openness to new perspectives and a shared desire for cooperative examination of the impact of our individual and collective actions. Such prerequisites encourage individuals to

examine their personal beliefs and practices and their impact on the society. These examinations should lead to further actions that are well informed and aim to further the community's democratic values.

In the context of education, critical pragmatism aims to reexamine the assumptions about educational goals, curriculum, and instruction to raise consciousness and bring about changes in education. Critical pragmatists see education as the tool to empower subordinate groups to overcome patterns of domination. Education is the vehicle to propel society into the future rather than maintain the status quo. Teachers need to develop a curriculum that exposes the historical, sociological, and political views that dominated the society. They need to create learning experiences that will foster critical examinations of such views and bring about insights that will produce ideas for further actions that will change the society and address its ills. In other words, the schools should be the think tanks that empower future generations with critical, reflective thinking skills that will enable them to lead a true democratic, progressive society. This change can be achieved only by providing curricula that encourage teachers and students to explore their options, evaluate the consequences of such options, and be instruments for a better future.

## CRITICAL PRAXIS

---

Praxis is the union of action and reflection and of theory and practice. Paulo Freire refers to praxis as the reassertion of human action for a more human world on two levels, the individual and social, where the simultaneous changing of circumstances

and self-change occur. Critical praxis is threefold and includes self-reflection, reflective action, and collective reflective action. According to Karl Marx and Friedrich Engels, revolutionary practice is the changing of circumstance and human activity. Critical educational praxis occurs in two contexts: (1) authentic dialogue between learners and (2) the social reality in which people exist.

There is a long tradition of scholarship on thoughtful action and the deep connection between theory and practice in Western philosophy. The origin of *praxis* is Greek and refers to any activity a free person performs, especially in politics and business. According to John Locke, all human knowledge is divided into *physike praktike*, and *semiotike*; *praktike* is viewed as the skill of rightly applying one's powers and actions for the attainment of things good and useful. Georg Wilhelm Friedrich Hegel resists such a distinction between practical and theoretical and pushes for a higher synthesis of the two, a synthesis that is individual praxis.

In recent applications to public education, Ernest Morrell and Jeff Duncan-Andrade have used critical praxis as a tool for urban youth to break down the power relations inherent in traditional schooling so that students identify as collaborators with teachers in the struggle for social change. They acknowledge that critical praxis in the classroom involves a continuous, self-reflective cycle between theory and action as follows: (a) identifying a problem, (b) researching the problem, (c) developing a collective plan of action to address that problem, (d) implementing the collective plan of action, and (e) evaluating the action and assessing its efficacy in reexamining the state of the problem. Thus, critical praxis involves a constant path of evaluating thought with action, theory with practice, in the effort to gain a higher consciousness for positive change upon the world.

## CRITICAL RACE FEMINISM

---

Although feminist theory does specifically address issues of power, oppression, and conflict for women in U.S. society, one criticism of this theory is its insufficient ability to meet the theoretical needs of women of color. Critical race feminism is a feminist perspective of critical race theory. As an outgrowth of critical legal studies and critical race theory, critical race feminism acknowledges, accepts, and addresses Black experiences as different from those of critical race theory and feminist theory. Critical race feminism focuses on the issues of power, oppression, and conflict centralized in feminist theory. It also leans on many of the tenets and elements of critical race theory: (a) addressing essentialism and antiessentialism and intersectionality, (b) the normalization of race and racism, (c) addressing interest convergence, (d) dismantling color-blind notions of equality, (e) addressing race as a social construction, (f) using storytelling and counterstorytelling for voices of color. Antiessentialism and intersectionality, normalization and ordinariness of race and racism, and counterstorytelling are key elements in critical race feminism. In addition, critical race feminism addresses the complexities of race and gender with notions of multidimensionality. Finally, critical race feminism values both abstract theorizing and practice.

Reconceptualist notions of curriculum theory align well with critical race feminism. Such notions have firmly placed the lived experience, past (regressive) and future (progressive), as central to one's identity. The regressive and the progressive must be understood (analytical) for the self to become expanded. In other words, it is necessary to be reflective about who we are and who we want to become in order for us to truly understand ourselves. The most significant place where curriculum theory and critical race feminism share

theoretical space lies with the storied, lived experience. In curriculum theory, the center is the storied experience and the interdisciplinary study of the educational experience. Although the experience may be individual and/or collective, and experiences may vary in curriculum theory, but they are based on the past and present life. The past life is designed to teach us. It is designed to inform us in ways that may alter the ways we choose to engage in the present life.

The autobiographical method of *currere* is as central to curriculum theory as storytelling and counterstory are to critical race feminism. In both cases, there is the necessity to examine the self, to reveal it, to analyze it, and to create change. The ability to tell one's story is significantly important in both theories. And in each case, the story is multidimensional as it reveals our social, historical, cultural, and political identities.

Curriculum theory and critical race feminism have counterpoints, or places of departure. Curriculum theory has not always been inclusive. In fact, it has followed much the same path as the policies of public education. Reconceptualist scholars have addressed issues relevant to the cultural, social, and political environments of public education. Critical race feminism, on the other hand, was born of the notion of centering the marginalized. And though curriculum theory is still encouraging and urging the voices of socially marginalized scholars into the lexicon of scholarship, critical race feminism began with an intense population of such voices. The significant point of departure in these theories is contributed to time.

Education and its goals were very different 200 years ago. When curriculum theory in the United States was developed, education was most often limited to males, usually White males. There were a few White females who were permitted to become educated. However, these women were often ladies of wealthy families who were often expected to use their education as a means of acquiring suitable spouses. People of color and of the working class were not privy to education during this time. As this country embarked on its Industrial Age, more of its citizens were likely to be educated, but the quality of the education varied with the class of family receiving the education. In addition, gender and race continued to play significant roles in the quality of education.

The 20th century brought many changes regarding equity and education, especially the latter part of the 20th century. Laws, court rulings, and policies made it much more possible for all students to receive an equal and equitable education. In the 21st century, a quality education is much more possible than in years past. But as in all of the earlier decades, race and gender issues remain obstacles to educational utopia.

Although curriculum theory implies multidimensionality of being with its focus on the lived educational experience, critical race feminism is explicit about the significance of multidimensionality and intersectionality of identity. The work of some reconceptualist scholars has pushed us to examine and to reexamine ourselves, to enter a complicated conversation about who we are as teachers and learners and the ways in which our past teaching and learning lives influence our imagined lives as teachers and learners. Critical race feminism allows us to examine all of who we are and the ways in which our multiple and intersecting identities influence our view about teaching and learning experiences.

the aim of analyzing and addressing issues of race and racism in education, CRT incorporates constructs from the disciplines of ethnic studies, women's studies, legal theory, philosophy, sociology, and history. Although not limited to the aforementioned disciplines, CRT scholars have recently expanded its reach to the fields of urban planning, public health, and medicine.

### Origins

Responding to the critical legal studies (CLS) movement in legal scholarship, CRT was the attempt by legal scholars of color to critique liberalism. The CLS scholars understood the legal system to be unjust with regard to issues of class, but CRT scholars felt that it did not take into account all the necessary evils that contributed to an unjust society. Challenging their primary focus on class, CRT scholars felt it was just as important to incorporate race as one of the evils that contribute to an unjust legal system. Their understanding was that racism will not go away because just because CLS scholars argue that the law is reflective of the interests of the power structure. Instead, CRT scholars operated on the premise that social reality is constructed through narrative. In creating such an exchange, narrative becomes the compound agent that embraces an interdisciplinary approach. To the CRT scholar, the theoretical construct expands the scope of CLS through the addition of a racial component by way of critique of the liberal tradition in legal scholarship.

From the legal perspective, there are three components of CRT that are relevant to the analysis of race and racism in education and curriculum studies. The first is the social construction of race. CRT scholars understand that race is not a fixed term. Instead, it is a socially constructed phenomenon with political implications regarding members of the in (i.e., accepted) and the out (i.e., marginalized) groups. Where there are no biological determinants to race; race and racism operate a set of complex relationships that come from a complex self-reinforcing process subject to the macro- and microforces. On the macrolevel, social and political struggle influence how we understand race and racism. At the microlevel, these larger influences affect our daily decisions. Where race is biologically false, it is socially real in relation to the experiences of

---

## CRITICAL RACE THEORY

---

Over the past 15 years, critical race theory (CRT) has been utilized as a tool in the structural analysis of K–16 education in the United States and internationally and a basic construct in curriculum studies. As an interdisciplinary method with

people of color in relation to race, class, and gender hierarchies.

Second is the idea of interest convergence. Coined by Derrick Bell, the construct posits the idea that policies aimed at achieving racial equality will be enacted only to the extent that they are of some advantage to mainstream White society. Bell uses the example of the United States during the cold war, as the United States began an anticommunist campaign in Western Europe to stimulate commerce throughout the region. As Europeans questioned the fight against the evils of communism by the U.S. government, they were simultaneously able to view acts of terrorism committed against African American residents in urban areas and the rural South. As lynchings, beatings, and other acts of terror and intimidation were part of the nightly news broadcasts throughout Europe, these actions stood in direct contradiction to the U.S. pursuit of liberty through the promotion of anticommunist policies. When the United States realized this contradiction, it began to enact policies intended to address racial inequality. In this instance, economic and social policies converged to preserve the interests of the dominant culture.

A third overarching theme in CRT in the legal and educational sphere is the centrality of narrative. Because the value of the experiences, understandings, and processes of many communities of color have been discounted in scholarship in education and the law, narrative allows these historical and socially significant experiences to become comprehensible. Instead of abstracted theoretical constructs that have the potential to confuse and misinterpret findings, narrative provides a space for lucid articulation of curriculum implementation, educational policy constraints, and school culture. Because narrative operates from the ground up, it can allow the space for the experiences of people from marginalized groups to be foregrounded in the analysis of race, class, and gender in legal and educational settings.

### From Legal Theory to Education

CRT in education seeks to inform theory, research, pedagogy, curriculum, and policy. Operating on a theoretical and practical level, CRT in educational research and curriculum studies sees itself as making a contribution to praxis in that it supports

action and reflection in the world in order to change it. Understanding racism as endemic to U.S. life, CRT has become integral in the identification of the intricate and multifaceted intersections of race, class, and gender in education. Providing a format by which to locate the function of racism in education, CRT supports the need to

- be explicit in the naming of the endemic nature of racism and of White supremacy in U.S. society;
- expose, interrupt, and deconstruct colorblind or race-neutral policies that exclude certain students and communities from democratic participation in the educational process;
- understand the voices and narratives of people of color as valid and essential in providing quality education that is critical and holistic; and
- challenge the notion that the behavior and academic achievement of White upper-middle-class students is normative.

In addition to the aforementioned claims, CRT scholars argue that a scholarly critique of race and of racism cannot be the sole vehicle aimed at the eradication of practices that have historically marginalized people of color in education. Instead, CRT scholars have argued for a synthesis of research and community engagement to address the needs and concerns of students, parents, teachers, and community members in schools.

### Critical Race Theory as Method

Using CRT as method, CRT scholars in education understand the debilitating effects of racism and of White supremacy in education as connected to the historical legacy of schools in the United States. The following tenets frame how CRT can inform research methods in curriculum studies.

*The centrality of race and racism:* Race and racism are not monolithic concepts. Instead, they are complex, dynamic, and malleable social constructions endemic to life in the United States. Due to their shifting contexts, definitions of race can include and exclude groups depending on the historical moment. For example, immigrating and native-born Latino/as in the United States were once categorized as White; they have now been largely vilified as the culprits responsible for taking

jobs from U.S. citizens. By recognizing the historical and social evolutions of race, CRT seeks to problematize the paradigm.

*Challenge to dominant ideology:* The master narrative about most non-White students (with reference to African Americans, Latino/as, immigrants from the Global South and from the Middle East, Native Americans, Southeast Asians, etc.) in public education is engulfed in theories of deficit. CRT challenges the master narrative about the inability of students of color to excel in academic settings.

*Commitment to social justice:* CRT offers itself as a theoretical and methodological paradigm aimed at the elimination of race, class, and gender oppression.

*Centrality of experiential knowledge:* The knowledge of people of color in the fight against hegemonic forces in education is legitimate, valid, and necessary in creating spaces for said communities to engage justice work.

*Interdisciplinary perspective:* CRT borrows from legal theory, ethnic studies, women's studies, sociology, history, philosophy, economics, and other fields to argue for a comprehensive analysis of the functions of race and racism in education.

From these tenets, CRT scholars have begun to reshape traditional approaches to educational research while engaging schools and communities in the process.

### Critical Race Praxis

Eric Yamamoto, in championing the method known as critical race praxis, has made the parallel attempt to create a constructive method of bridging theoretical concepts and justice practice. He challenges CRT scholars to expand its boundaries through the implementation of praxis. At its center lies the idea of racial justice as antiracist practice.

Although arguing from a legal perspective, Yamamoto contends that CRT praxis enables lawyers to address color-on-color racial conflict in addition to White racism. The ability to address both suggests a race practice, providing the opportunity

for marginalized groups to address historical tensions between themselves while understanding said tensions as part of the larger function of White supremacy. From the legal perspective, such practice consists of establishing legal clinics, working in conjunction with community organizations, guiding student activists, establishing relationships with sympathetic politicians, and drafting ordinances and laws to address race-based inequity. In addition, his suggestion is that race praxis is characterized by reflective action. Such reflection is based on the application of theoretical concepts to the work done in solidarity with communities and the recasting of said concepts in light of the researchers' practical, on-the-ground experiences. Such analysis encourages scholars to focus their attention to the application of theory to work that is taking place on the ground. Where his suggestions for race praxis are directed toward attorneys and law professors, his work has been incorporated by university faculty in colleges of education, along with teachers and school administrators who are concerned with social justice.

Through the engagement of praxis-oriented agendas, CRT scholars in education and curriculum studies have created courses in teaching and administration, created alternative certification initiatives, and supported the recruitment and retention of people of color in teacher education programs. In addition, CRT scholars have connected with grassroots organizations that work with schools to get preservice and incoming teachers on board who have come through such programs.

In the shift from thought to action, CRT suggests community engagement as a means by which to apply theoretical concepts to practical issues. Rejecting traditional top-down approaches to educational justice, CRT scholars often side with action researchers who place theoretical assumptions as secondary to the experiential knowledge of the groups in question. When viewing the plight of urban schools, it is often a challenge not to develop a defeatist attitude. Understanding this dilemma, CRT scholars work in solidarity with communities, acknowledging that teaching and school administration are challenging professions. Performing either task with a critical lens entails complex navigation aimed at preventing educational institutions from further contributing to dangerous systems of control and subordination.

In addition, CRT scholars agree that academics should not be granted immunity from the realities of domination. In many instances colleges and universities contribute to a colonizing relationship with outside groups, performing research on them instead of with them. Such relationships enforce distrust and pensiveness in communities when approached by university researchers. To address the historical realities of this relationship, many CRT scholars in education have made the conscious commitment to stand in solidarity with classroom teachers, community members, and administrators who are committed to education that is holistic and critical. Research solely for the sake of academic inquiry becomes a bankrupt venture as communities of color are being decimated by lack of employment, health care shortages, housing disparities, and educational inequality. From a curriculum perspective, because high-stakes testing and hollow educational policies can create difficult situations for the aforementioned, CRT scholars are intentional in their support and respect of the space that teachers and administrators occupy in schools.

In order to counter the absurdity of success and completion as contrary to the norm for students of color in urban schools, CRT creates a space to dispel such ideas. Through discourse, narrative, and practice, teachers, students, administrators, and parents are given the opportunity to address the function of racism and how it impedes their daily ability to function in school.

Nevertheless, CRT scholars contend that writing is not enough. Many believe that they must engage in praxis that not only deconstructs the negative realities of the public school, but also supports models that have proven effective in providing students an education that reflects their self-worth and importance to the world. In so doing, faculty members that incorporate CRT in their work are forced to contend with the fact that critical analysis of racism remains questionable research in many colleges of education. Despite the fact that research on the effects and prevention of racism is not highly regarded in the academy, many agree that it is ridiculous to rest on the laurels of our position as faculty members. However, CRT scholars understand that as teachers battle with securing preparation time, pressure from state boards of education, high-stakes testing, and

strict discipline codes, it is impossible to dismiss these developments from the larger context of racism. In the end, many who have chosen to incorporate CRT into their work with communities continue to challenge supporters of the construct to be both critical and creative.

## CRITICAL THEORY CURRICULUM IDEOLOGY

---

Critical theory is a philosophical, sociological, and cultural studies term that relates closely to

matters of legitimation, power and conflict, and argument. These are matters of central and defining interest in curriculum studies. Critical theory can be defined as an orientation, a disposition, and a way of acting on the world in order to change it. Above all, critical theory is a form of social analysis that is not prepared to accept things at face value or as they are presented.

It is important to note that critical theory does not constitute a single approach, but rather can be found in a family of related approaches—feminism, Marxism, poststructuralism, postmodernism, post-coloniality, critical race theory, and queer theory, to mention a few. There are a number of defining qualities that set critical theory apart and make it a distinctive approach within curriculum studies.

First, there is the issue of how it positions itself as an approach. It takes a questioning stance toward truth, meaning, and the nature of society. It asks how things came to be the way they are and what forces operate to keep the world that way. Critical theory challenges beliefs, assumptions, and commonsense interpretations of the way the world is. Part of the approach of critical theory is a robust pursuit of things that are accepted unthinkingly or that are taken as being natural, a questioning of what is normally taken for granted, and a questioning of why this is the case. Critical theory does not accept there are single immutable truths, and it questions the legitimacy of single truths.

Second, critical theory has a number of substantive interests or concerns. One of its most central concerns is how power works and particularly for whom it works. It questions whose interests are being served in continuing to have structures, processes, and practices the way they are. The focus of critical theory thus becomes those practices, institutions, and structures that are unfair, unjust, or undemocratic. In this respect, critical theory is not about criticism or negativity in the sense of being carping, but rather with uncovering how ideas are formed, how they are held in place, and how they might be different. At its most fundamental level, the approach of critical theory is about exposing, unveiling, and unmasking falsity. Its intent is to puncture or interrupt objectified, dominant, or instrumental views.

Third, critical theory is overt and forthright about its transformative intent. In practical terms,

critical theory aims to make people aware of what frustrates or impedes them and how they might act on the situation so as to change or transform it. To put this another way, critical theory has an emancipatory intent in that it is committed to enabling people to free themselves from ideas and social practices that bind them, exploit them, or prevent them from being free by tapping into the ways in which people are unaware of how they are being exploited and how the situation they are in perpetuates this exploitation. The larger agenda to which critical theory is committed is ensuring the conditions that enable people to embark upon actions that are more fulfilling personally and that are collectively satisfying for society at large.

In all of this, critical theory is an orientation that is self-reflexive. It believes that there is no such thing as political innocence or neutrality; there are always interests being served, and the question is the extent to which these are known and made public. Its politics, which are quite overt, reside in its unwillingness to accept things the way they are and instead to continue to question the legitimacy and veracity of claims to knowledge and truth.

Critical theory has its greatest application to curriculum studies as an approach classroom teachers might use in their classrooms with students to have them look beyond surface appearances to see how social and political forces and arrangements that purport to be neutral, benign, and value free actually work to shape the way some groups are advantaged at the expense of others. Within preservice and inservice teacher education programs, critical theory can be used to analyze how the received school curriculum privileges particular viewpoints and those with certain types of cultural capital while denying or marginalizing others. Within graduate or research programs, critical theory can be a powerful tool with which to analyze educational policy reforms so as to expose their concealed agenda, even within, for example, apparently well-meaning policies such as No Child Left Behind in the United States.

Curriculum ideology is closely related to critical theory, but there are some important differences. In its wider sociological meaning the term *ideology* can be somewhat confusing and hard to pin down. One meaning refers to distorted forms of thinking or false consciousness. Ideology has also been used

by anthropologists such as Clifford Geertz to refer to symbols, ideas, and beliefs by which people make meaning of their lives. Marxist thinkers take ideology to refer to the justifications used by interest groups to advance a particular political or economic viewpoint. Ideology is also used to label and disparage groups who have ideas that vary from the dominant mainstream views.

In relation to curriculum studies, according to Michael Apple, the most important aspect about ideology is that it deals with matters of power, conflict, legitimation, and the special style of argumentation in dealing with these. Dennis Carlson extends this idea when he talks about the way ideology masks and veils the real agenda being served and presents them as being different from what they really are. In the end, Carlson arrives at much the same conclusion as Apple: Because of the confusion over meaning and language and the increasingly disparaging use of the term ideology by the New Right, it is easier to dispense altogether with the language of ideology because it brings too much complex history with it.

Notwithstanding, an example of where this kind of thinking is helpful in curriculum studies is in taking a wider view of what schools exist for other than satisfying the needs of the labor market. Taking a more complex view enables us to stand back from the dominant fashionable view of schools being primarily about raising the educational achievements of students. As Apple and Lois Weis argue, when we take a wider social, cultural, and structural view of schools, a number of crucial questions become possible. For example, we can ask who education is working for, who benefits, and who loses or gets excluded. Clearly, schools assist and advantage particular groups of students more than others because of the closer match between the preferred norms and values of the school that are in essence middle-class institutions and the race, ethnicity, gender, and class of the students. In other words, schools act to legitimate some groups while excluding, marginalizing, or disadvantaging others that do not conform. The reality is that most schools do not have the kind of reflective surface with which to challenge these seemingly natural or common-sense assumptions. The consequence is that the myth gets to be sustained that schools provide equal opportunity to all students, and all that is

needed for success is the application of the right amount of effort by students.

## CRITICAL THEORY RESEARCH

---

Critical theory research in curriculum studies can be described as concerned with issues of power, intersecting oppressions, and inclusion–exclusion. Science is viewed as a form of political engagement that is ideologically and historically embedded. The general purpose of critical research is to address societal structures and institutions (whether long standing or newly emerging, ideological, discursive, or material circumstance) that oppress and exclude so that transformative actions can be generated that reduce the inequitable power condition. In curriculum studies, this critical examination focuses on the overall institution of education as a location of institutionalized, intersecting inequities (e.g., gender, race, socioeconomic level, sexual orientation) and more specifically, on the educational content experienced by students in daily

educational practice (e.g., knowledges considered to be important, language and discourses practices, teaching methodologies, judgment and evaluation, technologies). The purposes of this discussion on critical theory research in curriculum studies are to explain what is meant by critical theory(ies) research, illustrate the diversity of perspectives that influence critical research in curriculum studies, describe how critical perspectives transform the conceptualization of research purposes and practices, and delineate barriers to the acceptance of critical research.

### What Is Meant by Critical?

The role of critical theory research, along with the construction of a critical social science, is to facilitate circumstances that are transformative, to have a liberating political impact on the lives of those who deal with the complexity of intersecting oppressions. A commitment is made to the common good, to the common welfare of all. This role requires continual examination of societal institutions, regulations, and the distribution of power and resources. The researcher acknowledges her or his role as a very interested and value-laden observer who is a critical voice of social consciousness.

Critical theorist views of knowledge challenge grand narratives that have dominated Enlightenment and modernist constructions of science. Knowledge(s) is/are viewed as historically constructed and embedded within social (and values) agendas, as always representing biases concerning what counts as information and how particular views should be legitimated, and as changing and varying ideologically (rather than cumulatively) with time, culture, and circumstance. Although critical research values the range of scholarly and diverse cultural and life voices of those who have come before, positivist constructions of scientific knowledge as accumulation and building upon the scientific discoveries of the past are rejected. The notion of building on prior work is understood as masking, and even denying, the cultural, values, and equity contexts in which choices regarding research questions and methods of interpretation are generated. Objectivity is believed to be an illusion that is used to deny societal or individual values. Further, the possibility that the privileging of

dominant forms of knowledge can actually reify particular oppressive conditions is of great concern from within critical perspectives. Rather than knowledge as accumulated, critical work recognizes and values the multiple, the multidirectional, the diversity of conceptualizations and life experiences, and the notion that inquiry can reveal previously unthought possibilities.

Researchers who are familiar with the postpositivist use of critical thinking may confuse the traditional scientific approach that would require continued critical examination of research design and attempts to objectively follow the scientific method with critical philosophical perspectives. Attempts in postpositivist inquiry to be critical require carefully following established rules for the conduct of research, often labeled critical realism or critical rationalism. Critical theoretical perspectives do not follow this point of view that assumes the existence of objectivity, but rather they are directly concerned with systems of power and even consider the practice of research to be implicated in the production, inscription, and reproduction of power. Language, knowledge, and power are viewed as interconnected, as constructing and producing each other, and as limiting conscious conceptualizations and understanding. Critical perspectives assume the need for increased social justice, for attention to oppressions and inequities, and that research requires transformative action. The purpose of research cannot be considered the determination of objective, apolitical knowledge because all knowledge is considered subjective, tied to power for someone or some group, and value laden.

When critical perspectives are interpreted from a postpositivist lens, the assumption is that that the focus on power is a new "critical truth"; further, this explanation is often used to label critical theorists as emphasizing only victimization and dwelling on the negative. In a postmodern age that continues to privilege and literally impose patriarchy, racism, and economic imperialism as the instruments of both hierarchal and distributed forms of power, most critical theorists believe that these traditional, dominant power discourses should be front and center. However, although issues of power and oppression drive the values agenda for critical perspectives, postmodern challenges to new universalist critical master narratives

concerning power are also placed at the forefront. Critical master narratives that would lead to emancipation or to increased social justice are considered dangerous and are continually contested, even as critical inquiry attempts to generate research that would increase possibilities for social transformations that are more equitable and just.

Critical research attempts to address systems of power, including power as circulating, distributed, and diffuse, while at the same time to create a continually self-conscious examination of the research itself as an instrument of power. Research is reconceptualized as requiring a different set of assumptions, questions, and expectations. This rethinking challenges constructs such as facts and nature as well as assumptions such as a belief in the normal or the right to interpret the thinking or minds of others. Research questions revolve around privilege, oppression, power, resistance, social justice, and societal institutions, discourses, and structures that construct and/or perpetuate those oppressions, as well as new ways of conceptualizing equity and possibilities for diverse ways of being. Research results focus on discourses and technologies that privilege or inhibit, on contingencies, and new possibilities for transformation.

The foundational conceptualization of curriculum theory and the field of curriculum studies that counters the more linear notion of curriculum development is an actual demonstration of the transformative possibilities that can be found within critical theory research. In addition, broad-based critical theory research in curriculum studies includes examinations of definitions of the curriculum construct and ways that particular definitions are legitimated and result in power for particular groups and perspectives that disqualify knowledges and ways of functioning of or for other groups. Finally, as a range of voices and perspectives have conducted research that would be considered critical and concerned with power and oppression, more specific questions are and can be addressed in curriculum studies. Examples of these specific issues are the privileging of certain forms of knowledge within curricular content, public policy or legislation that generates particular interpretations of curriculum, methodologies that make forms of curriculum invisible, emergent curriculum discourses, and transformative curriculum.

### Voices of Critical Perspectives

Critical theories have originated from a range of locations and are most commonly tied to the work of Frankfurt School scholars in Germany, the neo-Marxist work of theorists such as Theodor Adorno and Herbert Marcuse, and continental scholars such as Michel Foucault and Jacques Derrida; although differing across theorists, elaborations of this work are most often labeled critical theory. These scholars have certainly focused on the complexities of power and resistance within the diversity of human circumstance. However, this work has emerged at a time in which diverse voices were challenging modernist truth orientations and universalist impositions from a range of philosophical and life locations and were asking critical questions in some form or another, such as the following: Who or what is heard? Who or what is silenced? Who is privileged? Who is disqualified? How are forms of inclusion and exclusion being created? How are power relations constructed and managed?

In addition to forms of scholarship that have been directly labeled critical theory, these philosophical positions that are concerned with power, oppression, and equity include (but are not limited to) the following: various feminist understandings that acknowledge the complexity of intersecting oppressions and those that directly challenge patriarchy, sexism, and other societal forms of normalization; cultural studies that have unveiled the diversity of human knowledges; post-structuralism and queer theory that would not only challenge regimes of the normal, but also address the discourses and hidden universalist assumptions that construct and perpetuate those discourses; critical pedagogy that puts forward the recognition that all educational practice is political and should play a major antihegemonic role in society; and postcolonialism that insists on deconstructing Euro-American, androcentric beliefs. Critical pedagogy as elaborated by Paulo Friere and expounded in the work of Joe Kincheloe, Peter McLaren, and Henry Giroux—women of color feminists such as Patricia Hill Collins, Gloria Anzaldúa, and bell hooks who have detailed the complexity of intersecting forms of domination—poststructural work of Foucault that examines the archeology of knowledge—are all specific critical examples. Calls for postimperialist science in the

work of Patti Lather and indigenous research agendas in the work of Linda Tahiwai Smith are further examples.

The hybrid, even mixed life experiences, of those who do not fit or accept dominant interpretations of the world, have resulted in critical perspectives that are themselves crossbred, multiple, and blended. Lenses are both theoretical and anti-theoretical, and prefer meaning that is emergent and hybrid rather than legitimated, using calls for authenticity or purity. Voices and perceptions critique and impact each other, whether feminisms as influencing predominantly male-oriented critical theories, or postcolonial critique that has reconceptualized poststructural notions of power and resistance. Hybrid understandings then result in previously unthought vantage points from which to examine tentacles of power within society and more specifically, within education.

### Transforming Research

From a critical theory perspective, when one recognizes the role that has been played by research in the construction of human power relations, research is understood as something that must either be rejected entirely or transformed in ways that would decrease oppression and inequity. For example, child development research has assumed the Euro-American concept that one group can determine what is in the mind of the other and can then plan educational curriculum experiences for that other that will lead to particular outcomes. Power is created for the developmental researcher and for the curriculum planner. Children (especially if they do not fit the Euro-American model) and anyone who disagrees with the child development model are placed in the margins of legitimacy by this research practice. Dominant forms of research such as the preceding example are believed by critical theorists to actually increase social injustice, resulting in greater power for some and increased labeling and marginalization for others.

However, critical theorists recognize the importance of history and context and that contemporarily research will continue to be practiced. As previously discussed, this practice can itself be reconceptualized as a critical social science that functions continually with a social consciousness that would address issues of power, oppression,

and social justice. Research designs can be planned or emergent and allow for diverse data orientations. Existing data collection methods such as document analysis, participant observation, and naturalistic interviews are useful for critical inquiry along with methods that have emerged specific to critical research. These methods include archeology, deconstruction, genealogy, and juxtaposition. Furthermore, critical investigations also employ emergent methods that fit a particular issue as well as methods such as critical bricolage that facilitate research orientations by acknowledging the existence of multiple knowledges and diverse contingencies.

This transformed research is activist in orientation. Because the perspective accepts the notion that nothing is apolitical, research projects themselves are critically examined even as they are used to address curricular problems and educational issues. The importance of collaboration with public communities in ways that challenge positions of privilege created by researchers is recognized. Critical research inquires deeply into the social and political arrangements that have resulted in the disenfranchised playing roles in the perpetuation of their own oppression. The use of language, discourse practices, and power relations that prevent more just transformations are examined.

### Barriers to the Acceptance of Critical Research in Curriculum Studies

Although critical research has revealed the privileging of particular knowledges and forms of learning from within curriculum studies over the past 20 to 30 years, this work has not entirely led to curriculum content and practices that increase social justice. A variety of overlapping contemporary conditions can explain this lack of transformative effect. At least three reasons have been put forward to explain the complexity, male dominance, and academic orientation of the work and writing itself; planned backlashes against civil rights gains of the 1960s that would discredit critique and possibilities for diverse perspectives; and a contemporary hypercapitalism that has interpreted educational purposes and curriculum, as well as other societal practices, from within the confines of test score accountability, entrepreneurialism, and profitability.

First, regarding male orientations and academic complexity, critiques by feminists, scholars of

color, and other groups who have been traditionally marginalized have served to revise androcentric methods of critique and resulted in hybrid (and more complex) approaches to studies of power and oppression (as discussed previously). In addition, as an increasing range of scholars has engaged in critical research, reconceptualized curriculum studies and the general analysis of society and social justice have become more familiar to a broader base of scholars. Finally, the importance of thinking differently about knowledge, power, and educational content has been recognized; critical language is considered necessary to avoid terminologies that limit thought to dominant ways of functioning that act to perpetuate oppression.

The second and third barriers are related to each other. Each falls within a general reaction by those with power to gains made by people of color, women, and even children based on civil rights successes of the 1960s (especially in the United States). Academic work and curriculum studies were viewed as closely tied to these gains by those whose power was threatened, and immediate actions were taken to attempt to discredit diverse voices regarding life experiences and scholarship. An example of this attempt is the creation of the National Association of Scholars; other activities included attempts to discredit women's and gender studies, ethnic studies that supported diverse knowledges, and multicultural education. This backlash continues to be a barrier as some universities and newly formed think tanks (since the 1970s) foster research perspectives that are limited to measurement and quantitative analysis. Finally, the acceptance of a form of capitalism that has commodified all knowledge as that which can be sold for profit is one of the greatest threats to critical theory research. In many educational circles, curriculum is not discussed as tied to values and related to privilege, oppression, and equity, but something that would raise test scores (the capitalist measure of accountability). Social justice is even redefined from within this perspective to mean equal opportunity to do well on a high-stakes test.

## CULT OF EFFICIENCY

---

The term *cult of efficiency* comes from the title of a book published by educational historian Raymond E. Callahan in 1962, *Education and the Cult of Efficiency: A Study of the Forces That Have Shaped the Administration of the Public Schools*. As the book title implies, its major focus was on the topic of school administration. The curriculum in the early 20th century, and after, was substantively shaped by school administrators, who in many ways impeded improvement of academic study in the schools. Thus, Callahan's study of school administration and school administrators has dramatic and troubling impact on the school curriculum.

Callahan dealt with the business efficiency movement that swept the field of school administration in the early 20th century. He traced its roots to an efficiency movement that pervaded U.S. business, at least rhetorically, beginning in the 1890s. The form of efficiency called scientific management, a movement that was fundamentally nonscientific, was especially popular. As efficiency loomed more and more prominently in business and industry, it easily made its way into U.S. public schools. Callahan argues that local control of U.S. education made school administrators exceptionally susceptible to direct movement from the larger society into educational affairs. Although the nuts and bolts of the school curriculum were a secondary concern for the business efficiency advocates, implementation of their criterion of

efficiency and cost accounting to achieve that efficiency certainly did not bode well for academic subjects such as foreign languages, particularly the classical languages. Thus, the efficiency movement in school administration facilitated the dilution of the academic curriculum, especially after efficiency evolved from an economic concept to a concept of social efficiency in which school subjects were evaluated on their ability to contribute to the goals of a smoothly functioning industry. Both economic or business efficiency and social efficiency were closely tied to vocational education, an approach that basically shifted many of the costs of job training from employers to the public schools.

The curricular training of school administrators was greatly influenced by the efficiency movement that pervaded school administration as a field. In fact, it was through the influence of efficiency that the professional training of school administrators received a major boost in the early 20th century. Prior to the efficiency movement, school administrators advanced to their jobs through seniority in the school system and through attainments of leadership positions inside and outside of education. Often times, school administrators were distinguished intellectually, more so than managerially. Administrator training programs gravitated to the postgraduate level of study in leading institutions of higher education such as Teachers College of Columbia University. Utilizing an efficiency rationale and a series of courses that emphasized topics such as cost accounting, other aspects of educational finance, and scientific management, school administrators were trained to become educational executives and managers. The notions of subject matter expert, curriculum developer, or pedagogical leader took second place in the field of school administration to the image of a captain of education who would operate on the model of a captain of industry.

The development of quantitative surveys of schools and school systems, sometimes but not always sophisticated accounting exercises conducted by professors of administration hired by their students who were leading public school systems, facilitated an image of efficiency in those systems. Of course, those surveys also allowed those who conducted them to profit at the expense of school taxpayers who were inveigled to believe

that the efforts led to better education for their children.

Thus, school subjects and other aspects of the curriculum faded from the spotlight in school administration and in discussions of schooling by educational leaders to be replaced by notions of cost and cost containment. The advent of early educational research, particularly but not only the development of standardized testing, facilitated the actions of school administrators who were intent on placing pupils in the proper “slots” in the system. Curricular issues became the province of subject matter specialists inside and outside of schools of education, and their views took a decidedly inferior place alongside the hard-nosed insights of efficiency oriented administrators. If curriculum was conceived in ways that it could be measured, such as behavioral objectives, it might be addressed by school administrators and their leaders.

## CULTURAL AND LINGUISTIC DIFFERENCES

---

Cultural and linguistic differences refer to differences among various cultural groups who speak a variety of languages and dialects. Cultural and linguistic differences sometimes are identified and used as two separate terms for different purposes in different settings. Cultural and linguistic differences are often identified in reference to English as the dominant language and to the cultural traditions and practices associated with the English language as the mainstream culture. Hence, the

notion of cultural and linguistic differences is often associated with cultural groups who do not speak English as the first language and who have beliefs, social practices, family values, and ways of knowing and doing that are different from mainstream culture. However, a dominant culture and language in one country may be a minority in another country. For example, Chinese, with the largest number of speakers in the world, is dominant in China, but is a minority language in North America. English is a minority language in China. So the importance of this for curriculum is that cultural and linguistic differences among children need to be treated as curricular resources rather than as curriculum deficits.

When the notion of cultural and linguistic differences is discussed in curriculum studies, it refers to the differences between ethnically, linguistically, and culturally diverse families and mainstream schools in immigrant countries such as the United States and Canada. A diverse cluster of topics is discussed: expectations and values in children's education and academic achievement, attitudes, and approaches to discipline and homework; parental involvement; the role of parents; the role of teachers; the role of schools; English language acquisition and literacy development; home and heritage language and culture maintenance; antiracist education and multicultural education; and other topics. There are calls for culturally sensitive curriculum. Culturally responsive teaching has become both a topic in educational studies and a target in teacher education programs. Special programs and projects are developed for English literacy and language development, such as immersion programs in bilingual education, dual language, and multiliteracies.

In curriculum, cultural and linguistic differences, as a term, is inevitably associated with linguistic and cultural diversity. Different people approach and interpret these terms from different points of view. Some emphasize differences and perceive cultural and linguistic differences as a challenging complex issue for school curriculum. Some call for culturally sensitive curriculum and develop well-intended programs to accommodate diverse needs of the learners from different cultural and linguistic groups to help them adapt to and succeed in the mainstream society. Some call for redesigning and reconceptualizing curriculum to address issues and concerns that affect students of different cultural

and linguistic groups. Others emphasize diversity over differences in an attempt to celebrate linguistic and cultural diversities as resources for the mainstream schools rather than perceiving cultural and linguistic differences as challenges.

Many believe that the most important issue facing curriculum is cultural and linguistic differences among students and among their homes and school communities. Many communities are composed of multicultural and multilingual groups, and major urban centers such as Toronto and New York have more than half of the students coming from homes where English is not the first language. Local culturally and linguistically diverse communities often gather in such a way that many schools have a student population where White students are in the minority. Cultural and linguistic differences from community to community, from school to school, and from classroom to classroom within schools, drive much curriculum policy making and local practices.

Consequently, the curriculum issue tends to be divided into two parts: removing the educational disadvantages arising from social discrimination and differential academic achievement, and developing an understanding among all students of the rich cultural and linguistic learnings to be achieved by association with people of difference. The first part is generally seen as a deficit issue in which the effects of racial discrimination and lowered achievement and therefore of lowered social and economic opportunities are attributed to minority cultural and linguistic differences. For example, some cultural groups are labeled as model minorities and some cultural groups are identified as having more children at risk in schooling. Minority groups are viewed as disadvantaged compared to the majority, and the idea of model minorities suggests some minorities are preferable to others. Consequently, discussions over diversifying curriculum and promoting multicultural and equitable education tend to focus on addressing diverse needs of learners of visible minority groups at disadvantage or at risk, in which the White group is not seen as one of the cultural and linguistic diverse groups. There is little discussion over the cultural and linguistic differences among the Whites. How to prepare all children including those from different White groups for a society of increasing cultural and linguistic diversity is yet to be adequately discussed and studied in the

field of curriculum. Furthermore, although it is helpful and useful in identifying diverse needs of learners of different cultural and language groups, cultural and linguistic differences within each cultural group need to be taken into account in curriculum design and implementation. For example, Asian Americans are ethnically diverse populations with corresponding cultural and linguistic differences, and within each Asian group, there is cultural and linguistic difference. There are 56 ethnic groups in China and many more dialects that effectively function as different linguistic groups. Such cultural and linguistic differences tend to be overlooked in English-speaking curriculum situations. Hence, there are two emerging curriculum issues: recognizing cultural and linguistic differences within each cultural group and among various cultural groups, and seeing cultural and linguistic differences as rich resources for individual and societal education and growth.

## CULTURAL EPOCH THEORY

---

Cultural epoch theory is a 19th- and early 20th-century theory that assumes human development to recapitulate or mirror the historical development of the human race. Educational and psychological scholars such as Johann Frederick Herbart and G. Stanley Hall are prominent early proponents. Harold Dunkel's treatment of the Herbartians elaborates the formative influence of disciples of Herbart on what emerged as the curriculum field of the 20th century, thus having continued influence on curriculum studies, by

showing the centrality of developmental theory to the field.

This theoretical perspective guided curricular discourse and planning as the mental disciplines theory, the notion that the mind was comprised of muscle-like entities for logic or imagination that profited from exercise, declined in prominence. Though Herbart died in 1841, his disciples in Germany taught the cultural epoch doctrine to U.S. educational scholars, such as Charles DeGarmo, Frank McMurry, Charles McMurry, and C. C. Van Liew. These Herbartians and G. Stanley Hall, from the stance of experimental psychology, perpetuated a cultural epoch curriculum in which they noted an intuitive epoch from infancy to about 8 years of age, an imaginative epoch from about age 6 to 10, and a logical epoch after age 10. Curriculum developers then matched literature with characteristics of each epoch. For instance Henry Wadsworth Longfellow's *Song of Hiawatha* might be used to develop intuition through emphasis on myth and hero, and Daniel DeFoe's *Robinson Crusoe* might be used to teach imaginative problem solving to children who were progressing through a process akin to the human race as it became civilized. Only after such developmentally appropriate beginnings were learners thought capable of logical reasoning and intellectual discourse necessary for engaging in freedom and self-governance of the individual in societal context. Francis Parker and John Dewey developed eclectic positions that saw the child, rather than either subject matter content or historical recapitulated epoch, as the organizing center of the curriculum. Therefore, cultural epoch was surpassed by progressive studies of the child in societal context.

The notion that the development of each human being metaphorically repeats the development of the human race has not had much currency for over a century; however, it is significant to curriculum studies because it was a precursor to many developmental theories that still serve as philosophical and psychological bases of curriculum: Alfred North Whitehead's rhythms of education through romance, precision, and generalization; Jean Piaget's stages of intellectual development from preoperational to concrete operations and then abstract thought; Erik Erikson's notions of social epigenesis, life cycles, and identity; Lawrence Kohlberg's theory of moral development from

attributions of goodness and badness to universal ethical principles; and Kieran Egan's curricular implications of a theory of development based on literary and cultural insights that advocates story-based curriculum appropriate to mythic, romantic, philosophic, and ironic stages. Along the way, such systematic images of development, though more flexible than many realized, were criticized by calls by the likes of Francis Parker, John Dewey, and Paulo Freire to place the learner at the center and listen carefully to what he or she understands to be developmentally appropriate in particular situations. Such situational perspectives on development critique the definitiveness and control of not only cultural epoch theory, but also any developmental theory that offers more or less rigid stages of human development. One may find such rigidity in realms of practice more than among those practitioners attempt to emulate, however. As the likely fabricated story of eminent psychoanalytic theorist, Carl Jung, is told, he said that he was glad to be Jung and not a Jungian because as Jung he could always change his mind and modify his theory and its application. This insightful anecdote is illustrative of how cultural epoch theory is significant to the broad field of education. It shows how developmental theories can limit opportunities for change and inclusion of dynamic perspectives of learners and teachers alike.

## CULTURAL IDENTITIES

---

Although the term *culture* has many definitions, it is generally understood to include the beliefs, traditions, rituals, knowledge, morals, customs, and value systems—among other essentials of social life—of groups and of the individuals who form

those groups. In its most general sense, then, the term *cultural identities* refers to the way that individuals or groups define themselves along the spectrum of these elements. The term has taken on increasing importance in the field of curriculum studies for a number of reasons. For one, the demographic shifts in population throughout the globe have resulted in vastly different societies in terms of race, ethnicity, and culture than was true even just a few decades ago. Most Western nations are now highly diverse, and even the most homogeneous non-Western nations are undergoing important demographic shifts. Second, and related to this diversity, classrooms around the world are now populated by children of tremendously different backgrounds, but the preparation of teachers, the climate in schools, and the curriculum to which these students are exposed have yet to catch up with the growing diversity. In order to be prepared, educators need to understand the meaning of cultural diversity, the development of cultural identities, and the implications these processes have for classroom and school curricula.

Developing a cultural identity is both a psychological and a sociopolitical process. A number of psychologists have created theories explaining individual cultural and racial identity development. At the same time, developing a cultural identity is a sociopolitical process in the sense that it is profoundly affected by the social, political, historic, and economic context in which one happens to live. Power, institutional arrangements, and the ideologies of one's society also have a powerful impact on the development of cultural identities.

Culture is sometimes viewed as an unchanging part of one's makeup in much the same way as height or skin color. Yet culture is dynamic. It is not something that one simply inherits or possesses, but rather something that one learns and creates. Thus, cultural identities are socially constructed—that is, they develop out of a particular social context. People create their cultural identities through interactions with others in the group or groups in which they participate. Nevertheless, culture does not determine one's identity, although it can certainly influence it. In a related vein, cultural identities are created through negotiation—that is, culture is not simply imposed on us; it is through the give-and-take of social relationships that we develop our identities.

### Cultural Identities, Hybridity, and Globalization

Although originally understood to refer primarily to ethnic culture, the term cultural identities today encompasses a broad range of factors including race, gender, sexual orientation, location, history, religion, and other differences. As a result, we can speak not only of Latino/a or Jewish culture, but also of youth culture, the deaf culture, and lesbian culture, among many other manifestations of cultural identities. Understanding this broader definition of cultural identities is crucial for those developing curriculum for today's schools.

Because individuals may participate in various cultural communities at the same time, cultural identities can be multifaceted. Thus, a person can identify in terms of ethnicity and race, or gender and social class, or ability and national origin, or any combination of these, all of which may make that particular person different from others in each of those groups. At the same time, and increasingly in our globalized world, cultural identities are often characterized by *hybridity*—that is, the fusion of various cultures to form new, distinct, and ever-changing identities. Hybridity refers not just to mixed-race and ethnic identity, but also to nationality, language, religion, location, and other elements that help define people.

Hybridity underscores the fact that there is no pure culture, uncontaminated by the influence of other groups, individuals, perspectives, histories, or contexts. Given the far-reaching effects of popular culture through the influence of the Internet and other international media, people in the most remote villages to the most cosmopolitan cities may listen to the same music, purchase the same clothes, and watch the same television programs. Popular culture therefore crosses national boundaries and affects people throughout the world.

The stresses and strains of modern life have had a significant impact on current definitions of cultural identity. For instance, the diaspora of huge segments of the world's population—the result of economic opportunity, political persecution, war, famine, and colonization—is one reason that cultural identity has become a significant aspect of 20th- and 21st-century reality. Increasing immigration during the latter part of the 20th century to the present has created many culturally diverse nations, and this diversity, in turn, has led to tensions over

definitions of what it means to be a citizen of a particular nation. This increased tension is true especially of Western nations that have seen a dramatic increase in immigration from former colonies and other developing countries.

### Cultural Identities and Curriculum

Cultural identities have become a significant issue in curriculum in the past half century precisely because of immigration and globalization. As groups that differ from the cultural mainstream have increased in numerous nations around the world, they are demanding equitable representation in many spheres of life, particularly in education. These demands not only have focused on the curriculum, but also are related to other institutional changes. Thus, identity politics has had an influence on such areas as curriculum offerings in K–12 and higher education, the recruitment of a more diverse faculty and staff, and the recognition through cultural clubs and organizations.

Because culture is always a hotly contested terrain, the matter of representation is fraught with tension and struggle. Some claim that the recognition of separate cultural identities is divisive, tearing apart the fabric of a society's common culture. This divisiveness is particularly true in cases where cultural identities are defined in fundamentalist ways. On the other hand, others have maintained that recognizing cultural identities is a matter of social justice, particularly where such identities have been marginalized or stigmatized. Curriculum developers, teachers, administrators, and other educators need to be aware of these controversies if they are to develop curricula to meet the needs of both their students and of the rapidly changing world.

## CULTURAL LITERACIES

---

The term *cultural literacies* refers to the values, attitudes, beliefs, and predispositions of each of the many cultural groups that make up the modern world and the societies in which we live. Cultural literacies refers to the ability to understand and value the customs, values, and beliefs of one's own culture and the cultures of others. The term implies the capacity to function harmoniously on a daily basis in social settings consisting of more than one culture. Cultural literacies are important in the development of multicultural curricula designed for schools serving more than one cultural group and for curricula aimed at preparing students to live in a culturally interdependent world.

The idea of cultural literacies in the plural form is an outgrowth of three ideas: culture, literacy, and multiple cultures or multiple literacies. Literacy is often defined as the ability to read, write, and speak the dominant language. The explosion of knowledge in the sciences, humanities, and the arts, and the expansion of media modes through television and computers, contributed to the expansion of the idea of literacy to the idea of cultural literacy defined as the knowledge and skills needed to succeed within a culture. Globalization and high levels of human migration in the world, along with curricular concerns for multiculturalism and cross-cultural understanding contributed to an expansion of the idea of cultural literacy to the idea that there are many cultural literacies. For curriculum

this means that even though a person of a different culture may not be literate in the dominant culture, he or she will exhibit literacy in his or her own culture. The idea of cultural literacies, therefore, is that a person exhibits literacy within his or her own culture. In the modern cross-cultural world there are many cultural literacies. For the curriculum, recognizing, valuing, and accepting cultural literacies other than one's own is a mark of being culturally literate. An individual may be said to be literate when that person has an awareness and understanding of the literacies of others as well as possessing literacy within his or her own culture.

The words *culture*, *literacy*, and *cultural literacies* are open to flexible definitions and to different interpretations. Readers in the area will confront two related but very different ideas. In one, cultural literacies refers to cultural expressions within a culture such as reading, writing, mathematics, science, history, and others. Within this interpretation of the notion of cultural literacies there are debates over which specific content elements should define literacy within that culture. The significance of this for curriculum has to do with what is considered core curriculum and what is considered peripheral, elective, or frill curriculum. Traditionally, reading, writing, and arithmetic were considered the core curriculum for cultural literacy. The idea has been expanded to many different content areas, so it is common to think in terms of different cultural literacies depending on students' talents and the particular selection of courses and overall program studied within a curriculum. The main curricular debates in this notion of cultural literacies are over three main matters: questions of core knowledge and skills—that is, what are the core knowledge areas and skills and how to represent them in the curriculum; broader questions of cultural characteristics and qualities and their cultural history and how to represent cultural qualities in the curriculum; and for progressive educators, the content and democratic forms of education needed to politically empower culturally disenfranchised students and how to create an action-oriented curriculum.

The second main way cultural literacies is defined and interpreted is in terms of culture specified in terms of language and culture of origin. This view of cultural literacies is central to curriculum in multicultural and cross-cultural settings. Cultural

literacies in the curriculum implies that the curriculum turns away from the design of canonical learning to fit into the dominant culture and toward the recognition, understanding, and valuing of other cultural literacies. This turn does not imply a purely relativistic curricular stance. Students need to function in a particular society, and immigrant newcomers need to learn to function in that society. The idea of cultural literacies means that those from other cultures are recognized as being literate. Both the dominant cultural literacy and the various other cultural literacies represented by students become part of the curriculum.

The principal educational benefit of a curriculum built on the idea of cultural literacies is that it establishes a welcoming environment for students to understand one another's differences. In addition, the idea provides a framework that permits teachers and other educators in authority with a guide for viewing student and parent attitudes and behaviors as reflecting embedded cultural educational literacies rather than seeing them as expressions of ignorance or unwillingness to cooperate with the school. For example, in North American elementary school classrooms, Chinese parents may differ with teachers on questions of discipline and homework. A curriculum built on the singular idea of educating children to be culturally literate in the dominant culture will lead to the dismissal of parental views and to efforts to reeducate parents and children in the Western way. A curriculum built on the idea of cultural literacies will treat the parental view as the likely outcome of a valuable Chinese cultural literacy and will lead to more tolerant and proactive intercultural communication between parents and teachers. Cultural responsive teaching and multiliteracies result from such curriculum change initiatives.

## CULTURAL PRODUCTION/ REPRODUCTION

---

The two concepts of cultural production and cultural reproduction refer to the ways in which cultural form and content have continuity and yet are changeable. They are in essence two sides of the same coin. With regard to education, one can think of two kinds of reproduction: economic and cultural. The first, economic, refers to the role of education in reproducing positions in the paid and unpaid labor market. The second, cultural, refers to the ways in which education reproduces the norms, values, dispositions, and knowledge of a society. Usually, these norms, values, dispositions, and knowledge will be those of dominant groups. However, at other times, they will include those of oppressed groups. Often, because of struggles over what is to be reproduced, what counts as legitimate form and content is hybrid, a tense and complex compromise that includes both dominant and subordinate culture.

The word *groups* is crucial here. There are different dynamics of power that are being reproduced, including but not limited to class, gender, and race. Hence, understanding cultural reproduction requires a nuanced grasp of the multiplicity of relations of power in any society. Understanding cultural production also requires a grasp of differential power. But production by its very nature has a different focus than reproduction. It speaks to the power of lived culture, of the ways in which social movements, oppressed groups, youth, indeed everyone, create meanings in their daily lives and contest accepted meanings. This includes forms of popular culture, resistant meanings, forms of art, and similar things that speak back to dominant relations.

The curriculum participates in the reproduction and at times subversion of dominant meanings

and knowledge and the production of new meanings and identities. It is itself a cultural product, created out of the tensions, conflicts, and compromises over what should count as legitimate or official knowledge. In answering the question of what knowledge is of most worth, it also must take account of the equally crucial question of whose knowledge is of most worth and of new cultural productions.

But it is not only the content of the curriculum that participates in the struggles and compromises over official knowledge. The ways in which curricula are organized also speak to the manner in which groups with economic and cultural power establish particular forms of organizing knowledge. Thus, integrated curricula, discipline-centered curricula, and other forms are not necessarily neutral. As a number of sociologists have argued, different organizing principles and the comfort one has with them are also ways in which cultural reproduction goes on.

In addition to content and organization, there is something else that needs to be critically examined, however. The hidden curriculum—that is, the tacit norms, values, and behaviors that students experience in their daily lives of being in school—is also a powerful reflection on the relations of dominance and subordination and resistances to them in the larger society. The hidden curriculum is often the site where cultural reproduction and cultural production collide.

This fact points to something of considerable significance. Cultural reproduction is not a simple process. People have agency. They act on their own senses of what is good and bad and on their own lived cultural forms and content that may contain elements that enable them to resist dominant meanings, but they can often generate practices that are both hegemonic and counter-hegemonic at one and the same time. Thus, important elements of youth culture can both support dominant economic and cultural values and subvert them simultaneously.

This possibility means that our consideration of cultural reproduction and production needs to go beyond formal institutions such as schools. Popular culture, works of art, literature, television and radio, movies, music, and similar artifacts are key elements in both cultural reproduction and production. Religious institutions, community literacy

organizations, our day-to-day language use, and even informal networks also engage in these forms of reproduction and production that occur simultaneously. In essence, all culture is a production, a human construction. Some of it is commodified and some of it is lived.

A good example of these dynamics outside of schools is Nu Shu, the centuries' old secret language of women in parts of China that was used by women to communicate their realities, dreams, hopes, and laments to other women through oral traditions, letters, poetry, songs, weaving, and other art. It was a product of the often isolated and oppressive conditions that women experienced, a way of speaking back and forming bonds among women. At the same time, as it expanded it reproduced these bonds and social networks in ways that cemented them across generations. Thus, Nu Shu was both reproductive and productive at one and the same time. Similar things could be said about youth culture and its relation to dominant and subordinate cultures and meanings today. This is one of the reasons many educators have argued for greater critical focus on and inclusion of popular cultural forms in the curriculum.

One of the best ways of thinking about the relations between cultural reproduction and production is to use the language of the circuit of cultural production. The circuit of cultural production has three moments: production, distribution, and reception. Each of these moments can have different power relations. Take for example a textbook. It is produced by publishers under the regulatory eye of the state textbook guidelines. In the United States, Texas and Florida have a disproportionate influence on what is considered to be legitimate content and form because of their large populations and strong state control over knowledge. But the meanings included in the texts are constantly contested by groups with differential power and interests. Textbooks are then distributed through sales to individual states, districts, and schools. They are then received, used, and read by teachers and students.

However, there is a politics of reading this material. Texts can be read in dominant ways in which the reader accepts the knowledge without question. They can be read in negotiated ways, where the reader accepts parts of the text and rejects other parts. Finally, they can be dealt in oppositional

ways, when the cultural and ideological messages are resisted. Much of the way one reads a text depends on the cultures and histories that dominate the moment of reception. Thus, even simple educational products such as textbooks embody both reproductive and productive elements and are the results of the agency of groups with different agendas. And the act of even reading these texts is an active process in which the message sent is not necessarily the message that is received. Meanings are created as well as recreated.

## CULTURAL STUDIES IN RELATION TO CURRICULUM STUDIES

---

In relation to curriculum studies, cultural studies refers to a broad, interdisciplinary field of study that serves as a theoretical and methodological framework for understanding how the hidden, null, and overt curricula of formal and informal educational environments contribute to the construction of marginal and/or oppositional identities. Within a cultural studies framework, curriculum is understood as a representational practice or ideological medium through which the power to define and produce knowledge, and hence the horizons within which identity is constructed and made meaningful, is asserted and opposed.

Cultural studies approaches to the study of curriculum can be quite varied. Some approaches take the form of critical, ethnographic studies of schools, youth subcultures, or forms of popular

culture. Some curriculum scholars use key concepts developed in cultural studies to critique mainstream perspectives on multicultural curriculum and advance arguments in support of a more politicized notion of culture. Other curriculum scholars work within a cultural studies framework to argue for utilizing popular culture in the curriculum as a way to challenge official school knowledge and dominant worldviews. Cultural studies in relation to curriculum studies shares many of the same origins, themes, and aims of critical pedagogy and related, politically oriented analyses of curriculum. This entry first discusses cultural studies as a general academic field and then its development at the Centre for Contemporary Cultural Studies. Finally, key concepts and approaches are presented.

### Cultural Studies as a General Academic Field

Taken as a formalized academic field, cultural studies does not refer to the study of the traditional arts and their associated creative processes, although some work within cultural studies may take the traditional arts as its object of analysis. Nor does cultural studies refer simply to describing the function of cultural artifacts and practices within a particular society. Rather, cultural studies refers to a wide range of theoretical and empirical studies connected by a general commitment to understanding culture as a system of representational practices whereby social meaning is produced and reproduced, communicated and interpreted, asserted and opposed. Borrowing theoretical insights and methodologies from across disciplines in the social sciences and humanities, scholarship that falls under the general rubric of cultural studies often takes as its objects of study the representational practices of everyday life and popular culture, for example, the stylistic dimensions of youth subcultures, the various forms and messages of mass media, and the various expressions of consumer capitalism. Although its themes are diverse, cultural studies tends to focus on a number of interrelated, dynamic concepts, particularly representation, hegemony, and identity.

A key assumption for work in cultural studies is that individual and social identities do not exist outside of the representational systems through which such identities are constructed and expressed.

The politics of representation refers to the struggle to control the symbols, discourses, images, practices, and representations that define who, what, and how individuals are, should be, and can be. Studying and critiquing the politics of representation in relation to the construction of subordinate and marginalized identities represents a key objective of cultural studies scholarship. By questioning the notion that identity is reducible to an essential, stable, and unified social category that lies outside the representational systems that give identity meaning, cultural studies scholarship often highlights the ways in which identities are socially derived, historically contingent, and culturally expressed.

### British Cultural Studies and the Birmingham Centre for Contemporary Cultural Studies

Cultural studies was developed as a formalized field of study at the Centre for Contemporary Cultural Studies (CCCS) at the University of Birmingham in Great Britain. Following World War II, social changes in Great Britain such as the growth of youth subcultures and the proliferation of mass culture became a focal point of cultural analysis for a group of scholars based primarily at the University of Birmingham. In 1964, these scholars established CCCS at Birmingham in order to provide an institutional framework for their work.

In keeping with their Marxist influences, some of the early scholars of British cultural studies sought to reposition social class as an important element in the dynamics of cultural change by studying how the working class adapted to and/or resisted the pressures exerted by dominant cultural values and social arrangements. Initially, their focus on the working class was historical and sociological, and some cultural studies scholars expressed alarm about so-called mass culture replacing the more localized cultural practices and values of the working class. Books such as *The Uses of Literacy: Changing Patterns in English Mass Culture* by Richard Hoggart, *The Long Revolution* by Raymond Williams, and *The Making of the English Working Class* by E. P. Thompson helped lay the foundation for British cultural studies.

Much of the early work of the CCCS also focused on the emergent youth subcultures of the postwar era, for example, mods and hippies, and

argued that although the stylistic expressions and practices of youth subcultures emerged in relation to economic social relations, they could not be deterministically reduced as such. In addition, much like critical theory, the goal of cultural studies was to demystify the ideological overlay of cultural messages and practices. Cultural artifacts, images, and practices were texts to be interpreted and studied for their structural meaning. However, this meaning was not static, for it was created within and through those engaged in its cultural production and interpretation.

Hoggart served as CCCS director from 1964 until 1968, when Stuart Hall, perhaps the most influential and widely cited scholar of British cultural studies, assumed that post, which he held until 1979. In 1972, CCCS began publication of the journal *Working Papers in Cultural Studies* (WPCS) to serve as an outlet for the growing body of work in the field. A special issue of WPCS published in 1975 was subsequently republished as a book titled *Resistance Through Rituals: Youth Subcultures in Post-War Britain*.

### Key Concepts in Cultural Studies

As British cultural studies developed in the 1970s, a number of key concepts emerged that would carry over into and inform the curriculum studies field, particularly the analysis of curriculum as a political text. These themes are representation, hegemony, and identity.

#### *Culture and Representation*

At its most general level, cultural studies frames culture as a system of representation. This approach to culture is based in part on a branch of linguistics called *semiotics*, the study of signs and the processes by which signs communicate meaning. In semiotics, signs express or convey meaning by uniting signifiers (i.e., forms) and signifieds (i.e., concepts). Cultural studies extends the semiotic approach to language to the study of culture. Culture is constituted by images, sounds, objects, and activities (i.e., signifiers) that convey or signify concepts (i.e., signifieds). Because the study of culture is framed by a language-based approach to representation, cultural artifacts, images, sounds, and activities are viewed or analyzed as texts and

*signifying practices*. A signifying practice is the creation of a sign that produces meaning that must be interpreted according to a shared set of social and cultural codes.

For example, an individual's choice as to the vehicle he or she drives can be understood as a signifying practice if we consider that cars mean more than simply the sum of their mechanical parts. Aside from their functional purpose, automobiles represent extensions of identity and thereby communicate lifestyles: A jeep represents a rugged, outdoorsy lifestyle; a convertible represents the carefree fun of youth; a hybrid represents environmental consciousness; a sports car represents wealth and status. Advertising helps produce and reinforce the attachment of these social meanings (i.e., signifieds) to automobiles as things (i.e., signifiers).

Because cultural practices such as driving a car communicate meaning only to the extent that they can be interpreted within a shared set of social codes, culture provides the symbolic resources by which we come to define, understand, and express ourselves as individuals. The various social meanings we draw upon and internalize in order to define for ourselves and others who and what we are as individuals is a function of the representational systems to which we have access and the meaning that is attached by self and others to the symbols that circulate within that system. Thus, the power to determine the horizons of what counts as meaningful can be achieved by controlling the images, symbols, and social codes that make up cultural life, and this power is equivalent to the power to legitimate and naturalize a particular worldview as common sense, thereby determining the horizons within which self-definition and social meaning are achieved. This process of controlling and fixing the horizons of common sense is often referred to as hegemony.

### *Hegemony and Ideology*

Hegemony is a concept associated with Italian political theorist Antonio Gramsci that describes how social authority is exercised not through direct force or the brute display of power, but through the subtle and hidden arrangements that structure social and cultural life and that shape the beliefs, values, and ideas to which we have access. Thus, existing social formations seem quite normal

and natural, as do the commonsense horizons for thinking about alternative social arrangements. Hegemony is asserted through the validation and circulation of images and representations. Hegemony does not tell us what to think so much as it defines the parameters within which our acts and ideas have meaning.

Coupled with insights provided by other cultural theorists, Gramsci's work helped cultural studies scholars bridge key formulations of ideological reproduction. Early critical theorists had generally approached ideology as a form of distorted consciousness. In this formulation, ideology is a set of false beliefs expressed at the level of culture that obscures oppressive social structures. Later formulations of ideology took a more complex view in suggesting that ideology structures our consciousness and constitutes our subjectivity. In this way, ideology is defined as a lived experience rather than as a set of false beliefs that obscures a real or authentic state of affairs.

A key Gramscian insight developed by cultural studies scholarship is that hegemony is never totalizing. Subordinate groups are not simply passively positioned subjects upon whom power is encoded. Rather, power is resisted and contested on the symbolic field of culture. Resistance to the imposition of dominant, hegemonic social values and beliefs is often referred to as *counterhegemonic practice*. Counterhegemonic practices are performed or expressed through a variety of oppositional social and cultural forms that critique, subvert, or offer alternatives to hegemonic worldviews.

It is important to note that a cultural studies approach to cultural analysis assumes an explicit political stance through its critical exploration of the power-culture nexus. Cultural studies is a theoretically informed way to explain that nexus and challenge it as well in the interest of emancipatory and counterhegemonic goals.

### *Identity*

The concepts of representation and hegemony help frame one of the primary aims of cultural studies scholarship, which is to understand and critique how social identities are articulated in relation to hegemonic discourses. Broadly speaking, individuals define themselves and are defined by others via the social codes and meaning systems

to which they have access. For example, common-sense notions about what it means to be masculine or feminine are shaped at least partially by the images of men and women we see on billboard advertisements, on television, and in magazines. In addition, individuals signify these gender norms through the choices they make, among many others, about the clothes they wear, the music they listen to, the automobiles they drive, the way they interact with others. In reading these symbols as texts, individuals are encouraged or positioned to identify with these images. Sometimes, dominant, hegemonic representations can define identities in ways that are limiting and oppressive, for example, media messages that suggest in subtle and overt ways that passivity is a desirable feminine trait. The politics of representation refers to the struggle to control the symbols, discourses, images, practices, and representations that define who, what, and how we are, should be, and can be.

Rooted as they were in Marxist social analysis, early cultural studies scholars focused on social class as the essential category for subjective identification. However, as the cultural studies field matured and its theoretical contexts changed, some cultural studies scholars began to challenge the centrality of social class by noting its marginalization of other forms of subjective experience, most notably the experience of race and gender. Rather than being reducible to a class-based subject position determined by the economic and social arrangements of capitalism, identity was constituted by multiplicity, heterogeneity, and contradiction.

Insights provided by the work of French philosopher Michel Foucault encouraged cultural studies scholars to turn toward a discursive theory of identity. A discursive theory of identity argues that as objects of knowledge, identity and its attendant social markers such as race, ethnicity, or gender are products of discourse, constituted by the very language we use to talk about them and therefore do not lie outside language as essential, noncontingent objects or concepts to which language refers. They come to be defined as meaningful concepts only within the horizons of how we conceptualize, talk about, and act on that meaning. As a product of discourse rather than determinate social structures, identity can be understood as a crucial resource for the exercise of critical social agency. The multiplicity of signifying cultural practices made available to

individuals offers possibilities for resisting and countering oppressive social structures and narratives through the strategic and contingent expression of cross-boundary social affiliation and rearticulation. In this sense, linking identity and the politics of representation highlights the discursive and historically contingent nature of identity formation and thus opens up spaces for counterhegemonic practice to act and be in ways that confront and challenge power and offer possibilities for more equitable, just social realities.

### Cultural Studies Approaches to Curriculum Studies

#### *Culture and Curriculum*

Before examining how key concepts in cultural studies have influenced work in curriculum studies, it is useful to consider how a more traditional curricular concern with culture can be distinguished from a cultural studies approach. Curriculum scholars have long been interested in culture as a source of curriculum content and objectives and as a context or milieu for studying the relation between curriculum and society. Many curriculum scholars in the first half of the 20th century stressed the importance of understanding the social foundations of curriculum, with culture more or less defined as the set of values that defined social horizons. If the purpose of education is cultural transmission in the interest of both social conservation and growth, then the curriculum should help equip young people to draw critically upon knowledge in the interest of social analysis and improvement. Curriculum developers should look to social and cultural contexts as sources of content relevant and useful to the learner in a way that promotes critical thinking, autonomy, and problem solving. This view of culture as a resource is reflected in mainstream perspectives on multicultural education, where often the objective is expanding the students' range of cultural understanding through the inclusion of multicultural content in the curriculum.

Following World War II, a broader understanding of culture as a way of life became more prominent in curriculum thought. Culture increasingly was understood more structurally as the totality of one's representational and symbolic milieu—the

conscious and unconscious, implicit and explicit beliefs, values, habits, and practices that pattern and structure daily life and our interactions with others. With this more structural understanding of culture came renewed interest in the role the individual might play in cultural change, and thus a broader interest in relating culture to the formation of identity and individuality.

B. Othanel Smith, William O. Stanley, and J. Harlan Shores's influential 1950 synoptic textbook provides an example of how curriculum studies in the postwar era was beginning to engage culture as a broader, more politically charged field of analysis. They devoted the first chapter of their book to culture and defined it as the interwoven totality of one's intellectual, practical, and symbolic world. Drawing a clear distinction with the concept of society, they recognized culture as a representational, symbolic field of beliefs and practices that had historical continuity with the past. Curriculum could provide the framework for the dialectical progression of cultural change, as well as a framework for the exercise of human agency and choice in that change, as it mediated the individual child's relation to cultural values and practices. By suggesting that the cultural values and practices within which the child is socialized via the curriculum might be challenged and changed through the lived experience of those values, Smith, Stanley, and Shores demonstrated an awareness of how curriculum practice relates to cultural politics. However, their articulation lacked the critical perspectives characteristic of cultural studies, particularly as it focused almost exclusively on the formal curriculum of schooling.

The reconceptualization of curriculum studies in the 1970s marked an important transition in the way culture and curriculum have been linked. During this period, many curriculum scholars began to borrow theoretical frameworks from other disciplines in the humanities in order to explore the subjective dimensions of curriculum understanding and experience. This exploration opened up curriculum theory to the study of nontraditional and out-of-school educational experiences. Like culture, curriculum was increasingly coming to be understood as a text, a representational practice through which knowledge was produced and communicated. As curriculum study became more interdisciplinary and critical, theoretical insights and

methodological frameworks developed in the cultural studies field began to influence the political and popular culture dimensions of curriculum study.

The *Journal of Curriculum (JCT)* provided an important publishing outlet for work in curriculum studies that borrowed from cultural studies frameworks. In 1999, *JCT* published an interview with Stuart Hall, a leading scholar of British cultural studies and a founder of the Centre for Contemporary Cultural Studies at the University of Birmingham. A *JCT* issue published in 2002 was devoted entirely to popular culture. The influence of cultural studies on curriculum studies is also reflected in the evolution of the name of a curriculum studies special interest group (SIG) based within the American Educational Research Association. What is now called the Critical Issues in Curriculum and Cultural Studies SIG was originally founded in 1972 by curriculum scholar Edmund Short as the Creation and Utilization of Curriculum Knowledge SIG. *JCT* and curriculum studies conferences such as Bergamo, Curriculum and Pedagogy, and the American Association for the Advancement of Curriculum Studies continue to serve as important venues for the sharing of work in cultural studies.

### *Cultural Studies, Critical Pedagogy, and Popular Culture*

In the late 1970s, political analyses of curriculum coalesced around the work of curriculum scholars such as Michael Apple, Henry Giroux, Jean Anyon, and others who borrowed from critical and neo-Marxist orientations and concepts and focused on the curriculum as a medium for ideological reproduction and resistance. Schools socialize students into dominant cultural values and beliefs as certain kinds of knowledge, dispositions, and behaviors are validated and made available through explicit, hidden, and null curricula. Social and cultural hegemony is exercised in and through curriculum. As was the case with cultural studies, early political analyses of curriculum tended to emphasize the reproduction of economic and social class relations.

In the 1980s, insights culled from British cultural studies combined with the advances in the political analyses of curriculum encouraged critical

ethnographies of schooling similar to Paul Willis's influential book *Learning to Labor: How Working Class Kids Get Working Class Jobs*, published in 1977. Willis was an important figure in British cultural studies whose study of the schooling experiences of a group of working-class youth in Great Britain revealed how identities formed in apparent opposition to the dominant ideology of capitalism via the structures of schooling drew on and produced cultural practices that ironically reproduced and strengthened the very class structures upon which capitalism is based. Willis's work helped lay a theoretical foundation for similar studies of schooling in North America, and it served as a conduit for the introduction of cultural studies concepts in theories of schooling and curriculum.

For example, Peter McLaren's 1986 book *Schooling as Ritual Performance: Towards a Political Economy of Educational Symbols and Gestures* presented an ethnographic study of the schooling experiences of working-class youth at a Catholic middle school in Canada. His study examined how power relations were reproduced through the hidden and null curricula that structured the daily life of the school. Hegemony was exercised in schools via the validation, circulation, and enforcement of dominant values and forms of knowledge through the symbolic codes that structured the everyday life of schools.

However, critical ethnographies such as McLaren's also illustrate how teachers and students resisted cultural reproduction. Students and teachers were not merely powerless, passive recipients of a curriculum that reproduced dominant ideology, but were, through their opposition to hegemonic discourse displayed in their own cultural practices, able to exercise critical agency and impact structures of oppression and cultural authority. Critical pedagogy offered a way to formally intervene in ideological reproduction and build the critical capacity to demystify and challenge the hegemony of dominant cultural and social values.

Introducing popular culture into the curriculum offered a foundation for critical pedagogy. Cultural studies approaches to curriculum often give attention to the informal, out-of-school curriculum of popular culture, for example, television, music, literature, comic books, fashion styles, and video games. In the 1988 book *Critical Pedagogy, the*

*State, and Cultural Struggle*, Giroux and Roger Simon published an essay titled "Popular Culture and Critical Pedagogy: Everyday Life as a Basis for Curriculum Knowledge" in which they referenced cultural studies as a framework for using the contradictions between schooling and the real-world experiences of youth as a basis for social and cultural critique and revision.

The inclusion of popular culture in the curriculum represents an area of potential counterhegemonic practice because popular culture relates to lived experience. It is imbued with meaning by its participants and it points to processes of cultural production and resistance. Critical pedagogy involves teaching students to read culture, critique dominant ideology and school knowledge, and regain a sense of critical agency. As developed within a cultural studies framework, the argument for including popular culture in the curriculum and blurring the distinctions between in-school and out-of-school knowledge is predicated on the potential to exercise critical agency. The goal is not to study popular culture as artifact or use popular culture as a vehicle for making the standard school curriculum more palatable and engaging. Rather, popular culture is engaged performatively, as a signifying practice, in the interest of critiquing structures of power and oppression.

### *Multiculturalism, Race, and Ethnicity*

By the early 1990s, cultural studies had become a well-established and relatively unified academic field in the United States. Also at this time, public debate over multicultural curriculum reached new levels. The high-profile, politically driven culture wars of this period politicized curricular debates over whose literature, historical narratives, values, and knowledge should be taught in schools. Conservative educators argued for a core curriculum that drew heavily from Eurocentric cultural and canonical knowledge and history. As the national standards movement gained momentum and federal backing with the Goals 2000: Educate America Act of 1994, these debates intensified, even spilling over into the halls of Congress when that year the United States Senate held a contentious debate over the adoption of the controversial National History Standards. Many in the Senate felt the standards were divisive, did not

stress traditional U.S. values and historical facts, and were overly critical of U.S. history.

Some in the curriculum field engaged the culture wars by working to develop multicultural curriculum and arguing for more inclusion of multicultural materials in the curriculum. Others, however, looked increasingly to cultural studies as a way to challenge mainstream inclusion models of multicultural curriculum. Many cultural studies curriculum theorists argued for the inclusion of minority authors and artists not merely as a representative add-on of minority views, but in terms of how such texts offer narratives that are counter to dominant racial, ethnic, gendered, or other discourses and representational practices. Such narratives have the potential to highlight how issues of culture, identity, power, and knowledge intersect. These challenges often call into question categories of racial and ethnic identity, particularly as multicultural education implied an essentialist definition of ethnicity and race, as well as the limited attention it paid to issues of power.

In her 1996 book *Translating the Curriculum: From Multiculturalism to Cultural Studies*, curriculum scholar Susan Edgerton used a cultural studies framework to critique traditional perspectives on cultural literacy while also arguing that mainstream approaches to multicultural curriculum fail to address culture as a politicized site of identity formation. Rather than fostering essentialized or oppositional viewpoints, a curriculum informed by cultural studies can open up deconstructive possibilities for explorations of difference across marginalized social and individual identities. Such a curriculum would include autographical writing done alongside and engaged with the reading of literary works written by marginalized writers.

Similarly, Cameron McCarthy argued in a collection of essays published in 1998 as *The Uses of Culture: Education and the Limits of Ethnic Affiliation* that multicultural education must do more than simply add culturally diverse content to the curriculum. In its potential to challenge Eurocentrism and critique the totalizing and reductive discourses of racial, ethnic, and gender identity, multicultural curriculum offers a powerful form of social and cultural critique in the interest of more equitable educational opportunities and social arrangements. When critically informed, multicultural curriculum can reveal how the construction of

marginal identities is linked to cultural politics and the struggle to define the symbols, signs, and discourses that frame the meaning we give to who, what, and how we are individually and collectively. A cultural studies approach to multicultural curriculum would raise questions about the explicit, hidden, and null curricula of schooling by including the critical study of film, art, literature, and other cultural practices that are consciously engaged in as a means of asserting and countering hegemonic structures of domination and subordination.

### *Media, Globalization, and Neoliberalism*

Media literacy is another important area where cultural studies is used as a framework for conceptualizing popular culture and mass media as an out-of-school curriculum through which dominant social, economic, and political values are reproduced and resisted. Fostering critical media literacy is one way to demystify, resist, and reframe the crucial role mass media play in the production and circulation of social and cultural meaning. Critical media literacy promotes critical understanding of how media messages shape the representational boundaries within which subjectivity is framed and identity constructed and expressed. New media outlets such as blogs and social networking sites can be reconstructed as productive sites of counter-hegemonic practice where official knowledge is appropriated and reinscribed with meaning different from that intended by the original source.

Many curriculum scholars working within a cultural studies framework view neoliberalism as the primary ideological value embedded in the messages and practices that make up the informal, out-of-school curriculum of mass media. Neoliberalism is a political, economic, and social philosophy that promotes the application of capitalist free market principles to the organization of civic and public life. This application is achieved through practices like the privatization of formerly public services, the development of economic policies that favor transnational corporations, and the identification of consumerism with the public good.

Neoliberalism provides the political, economic, and cultural rationalizations for globalization, a rich source of scholarship in contemporary curriculum studies. With the proliferation of information and communication technology and the

ease and speed by which people can traverse virtual and physical space, identities that historically have been positioned and essentialized as colonized Other are able to counter the hegemonic forces of globalization by rearticulating new, discursive forms of hybrid identity that complicate national, ethnic, racial, and cultural boundaries. Cultural studies provides a framework for extending the study of curriculum to include the cultural practices that reproduce and challenge the literal and figurative borders that circumscribe identity.

### Conclusion

In relation to curriculum studies, cultural studies provides a critical framework for theorizing and studying the relational intersection of curriculum, power, ideology, and identity. Cultural studies expands the study of curriculum beyond the formal curriculum of school knowledge to include the informal curricula of popular culture, mass media, and consumerism in their hidden, null, and overt forms. In addition, cultural studies highlights the role in-school and out-of-school curricula play in the construction of cultural and social identities. Its transdisciplinary, some would say antidisciplinary, approach to cultural practices of all kinds, particularly those of youth and popular culture, its theoretical diversity, and its methodological flexibility, make cultural studies well suited to furthering the boundaries of curriculum theorizing as innovations in media and technology spark new cultural forms and social practices and as globalization deepens the complexities and contradictions of cultural and social identity.

## CURRERE

---

The infinitive form of the noun *currere* emphasizes curriculum as a complicated conversation among teachers and students focused on texts and the concepts they communicate in specific places at particular historical moments. Before *currere*, curriculum was defined exclusively in institutional terms. As *currere*, the point of the

school curriculum is not necessarily to train public school students to become specialists in the academic disciplines or to produce accomplished test takers or to produce efficient and docile employees for business. As *currere*, the point of the school curriculum is to inculcate—through the communication and criticism of academic knowledge—a civic commitment that extends to the sustainability of the planet. As *currere*, the point of the school curriculum is to teach students to think and act with intelligence, sensitivity, and courage in both the public sphere—as citizens aspiring to establish a democratic society—and in the private sphere, as individuals committed to other individuals. So conceived, the curriculum becomes a historical event, changing over time as we participate in it, engage in its study, and act in response to it toward the realization of our civic ideals and private dreams. Curriculum ceases to be a thing, and it is more than a process: it becomes a verb, an action, a social practice, a private meaning, and a public hope. Curriculum as *currere* is not just the site of our labor, it becomes the product of our labor, changing as we are changed by it.

The method of *currere* is an autobiographical means to study the lived experience of individual participants in curricular conversation. There are four steps or moments in the method of *currere*: the (1) regressive, (2) progressive, (3) analytical, and (4) synthetical. The regressive focuses on the past, the progressive on the future, the analytic on understanding the significance of these, and the synthetical encourages self-mobilization for action in the public sphere. In theoretical terms, these phases depict both temporal and reflective movements for the autobiographical study of educational experience and suggest the modes of cognitive relationality between knower and known that might characterize the structure of educational experience.

In the regressive step or moment, one's apparently past existential experience is conceived as data source. The point here is not to recall the past from the point of view of the present, but to re-experience the past so that the pool of memory enlarges. In the second or progressive step one looks toward what is not yet present, a form of free association inviting fantasies of who one is not now, of what is felt to be missing, sought after, aspired to. In the analytical stage the student

examines both past and present. Etymologically, *ana* means up, throughout; *lysis* means a loosening. The analysis of *currere* is akin to phenomenological bracketing; one's distanciation from past and future functions creates a subjective space of freedom in the present in which one asks the following: What is this temporal complexity that presents itself to me as the present moment? In the synthetical step—etymologically *syn* means together; *tithenai* means to place—one re-enters the circumstance typifying the present. Listening carefully to one's own inner voice in the historical and natural world, one asks the following: What is the meaning of the present?

The autobiographic project of *currere* is to contradict presentism by self-consciously cultivating the temporal structures of subjectivity, a lived complexity in which difference does not dissolve onto a flatted presentistic social surface. Without the lived sense of temporality the method of *currere* encourages, we are consigned to that social surface, and what we see is what we get. When we listen to the past we become attuned to the future. Then we can understand the present, which we can reconstruct, after our analysis of it. Subjective and social reconstruction is the professional obligation of progressive educators, as practitioners of *currere*. The education of the U.S. public requires the cultivation of temporality as well as self-reflexivity, intellectuality, and erudition. The consequence of *currere* is an intensified subjective engagement with the world. Subjectivity takes form, achieves content and singularity, in the world, which is itself reconstructed by subjectivity's engagement with it.

## CURRICULUM, DEFINITIONS OF

---

The term *curriculum* has numerous definitions. Some educators see the numerous and diverse definitions as a problem (confusion perpetuated, chaos within the field, etc.), while others suggest that when analyzed carefully, these definitions differ little. So why bother to address this cacophony of curriculum connotations?

In his 1992 interpretation of the field, Philip Jackson offered a clear and straightforward explanation for multiple curriculum definitions in relation to the growth of the curriculum field. For him, new definitions represent efforts to change or embellish the traditional meaning (and the one still commonly used) of course of study. John Dewey expanded upon this notion by introducing the learner's experience into the definition. For Dewey, the child or learner would be helped to encounter the curriculum (school subject or course of study) in a recursive, ongoing set of reconstructive engagements. In other words, the child and her or his experience would inevitably provide meaning to the curriculum. Later, Franklin Bobbitt maintained this centrality of experience as part of his curriculum definition and introduced several new elements that would remain in the definitional stew: the idea of location (in or out of school) and oversight (directed or undirected). Said differently, Bobbitt suggested that a curriculum is an entire range of experiences in its broadest sense and that only some of those experiences fall under the auspices of schooling. Further, these experiences outside of schools are both directed and undirected in nature. In his analysis of curriculum, Herbert Kliebard expanded upon Bobbitt's notions of curriculum by acknowledging undirected curriculum experiences such as the null or hidden curriculum.

Although efforts to alter and embellish the traditional definition of curriculum as course of study have continued since the turn of the 20th century, the experience-centered range established by Dewey and Bobbitt remains largely intact. As the field of curriculum studies became more popular and complex during the past century, curriculum definitions continued to reflect Bobbitt's 1918 range—from course of study (or permanent school subjects) at one end to all learning experiences throughout life

at the other. For more than a century, curriculum scholars produced new working definitions of curriculum, creating the field's definitional largesse. However, definitions do not come from curriculum scholars alone: every pedagogue, parent, pundit, policy maker, and politician has one, too. Today's conflicting definitions reflect different vantage points from which curriculum is engaged as well as different philosophies and foci regarding the relationship between schools and society. Moreover, the field is complex and understood in contradictory ways. In other words, the multiplication of curriculum definitions is not an urgent problem to be solved, but rather a state of affairs to be acknowledged as inevitable.

So why should curriculum workers concern themselves with the inevitable? The real purpose or value of a definition is its ability to clarify and explain one's understanding or position regarding curriculum. Of course, the motivation behind setting out one's position is to persuade others to choose this position or definition over another one—or at least to invite others into a shared understanding of one's own preferred definition and position toward some particular end. To accept this premise (i.e., that carefully articulating one's understanding of curriculum is done with the hope of persuading others to understand and embrace it) suggests that a curriculum conversation is constantly taking place among not only those with differing definitions of curriculum, but also those with differing vantage points and forums of engagement with curriculum. And while significant differences exist among these conversationalists (often based upon the nature of the curriculum work that they do), the more important questions in relation to curriculum definitions (and their respective arguments) have to do with which curriculum workers are actively participating in this larger conversation and toward what ends.

Thus, curriculum definitions cannot be seen outside the contexts of the work of those defining curriculum. How curriculum workers use language to understand what they do is as critical for the doing as it is for the understanding. Because curriculum definitions pertain to curriculum work and because that work is necessarily connected to the field, it is essential that curriculum workers recognize the vitality (or lack thereof) of curriculum in relation to schools and conversations about

work in schools. In short, curriculum workers must recognize the ways in which their definitions and conversations invite the participation of others in the field. Without this recognition, definitional progress and regress does little to expand the continuing conversation's audience beyond a collection of entrenched and relatively homogenous partisan enclaves.

Toward this end, the curriculum scholar with an earnest desire to define the field needs to wrestle with two critical concerns: First, how do the academic conversations within the field intersect to ensure coherence and potential for future growth as a field? Second, to what degree do these intellectual conversations intersect with the conversations of practitioners? In other words, to what degree do intellectual and practical conversations converge in meaningful ways?

Complex, conflicting, and sometimes contradictory curriculum conversations can generate meaningful definitions to inform the field. There are common denominators across time and curricular orientations that emerge as defining elements of this thing called curriculum when those definitions are normative. To the degree that definitions of curriculum have meaning and these meanings have significance in relation to schools, the definitions say something about the field, and they say something to the field. Conversely, to the degree that definitions merely categorize work in schools and offer no normative moorings, they serve no purpose beyond themselves. Curriculum workers can look to Dewey's work in *Democracy and Education* regarding communities to recognize the importance of meaning in curriculum work. When curriculum definitions have meaning to a wide range of curriculum workers, they invite meaningful actions.

One such common denominator for the field stems from the foundational works of Dewey and Bobbitt, in terms of both definitions and work: curriculum as experience. Although Dewey stated that curriculum was a course of study, he argued that there should be no gap between this course of study and the child's experiences. Bobbitt's focus shifted from current to future desired experiences (of adult life). The distinctions he saw emerging within the field (intended, unintended, null, enacted, etc.) further characterize the kinds of experiences learners have, while Hollis Caswell

and Doak Campbell defined curriculum as all of the experiences children have under the guidance of teachers. Ralph Tyler focused on selecting, organizing, and evaluating experiences based on deliberate purposes. Joseph Schwab challenged curriculum scholars in particular to renounce the field's retreat into theory and to create experiences through the art of the practical. Reconceptualist orientations have extended notions of curriculum to focus on the individual's encounter with experiences as critical theorists in the field focused more on the social context of experiences and how relations of power influence curriculum work. Those in the field who hold to a school-based focus for curriculum also addressed experiences—often within the context of democracy.

Contemporary definitions of curriculum as well as their absence from much of the practitioners' conversations in recent years pose challenges to the field. Although the word *curriculum* was closely tied to schooling through the 1980s, its use in the work of schools has declined since then. Regardless of the definition, the term curriculum itself has been seen less and less in the most popular professional journal for practitioners, *Educational Leadership*. Between 1974 and 2006, *Educational Leadership* had a 74% drop in the number of articles addressing curriculum matters. Further, those articles written by curriculum scholars representing the professors of curriculum group declined by 86% during that time. Finally, although earlier published articles focus more on curriculum theory, those appearing since the late 1980s focus largely on what-works applications with little to no attention given to substantive principles and theory.

Percentages aside, the nature of curriculum conversations in leading practitioner journals and books—and by association, in schools themselves—is now focused on curriculum standards, reform models, and prescriptive practices of mapping and aligning. The normative grounding of the field—its very ideological soul—appears absent from school-oriented curriculum conversations. The contemporary absence of meaningful definitions of curriculum from the work of schools has implications for curriculum scholars and practitioners alike. With this in mind, the significance of the field's experienced-based definitions (or more importantly, the lack thereof) is far more

important to ponder at this point in the field's maturation than the multiplicity of curriculum definitions per se.

## CURRICULUM, HISTORY OF

---

The field of curriculum history, as the broader education history, is organized by traditions of intellectual and social history; the former is concerned with the organization and changes in ideas and the latter with ideas as representing institutional and social changes found in policy and the actual programmatic developments. Typically, the historical narratives are about the progressive hopes of democracy in national schooling and/or

its denials through issues of the social control and structural inequities.

Another approach is to view curriculum as a history of the present. Although it is easy and almost clichéd to say that the past is in the present and a historical understanding of schooling is needed, the placement of our self in time and space is a difficult and profound task. History is not the movement toward some form of reliable representation that tells us about children's growth, learning, or civic responsibilities. Nor is history the point that culminates in the present from which people learn about their domestication and that provides a temporal index for their future. History is the critical engagement of the present. Ironically, an effective history undertakes to suspend history itself by making visible the conditions that make possible the thought and actions of the present. For example, to talk about the child as a problem solver is not merely a category to help children learn and become better people. The pedagogical distinction of problem solving embodied a cultural thesis about a mode of living—that is, problem solving instantiates particular principles about how to order reflection and action. Historical rather than natural and inevitable, problem solving is a style of life historically produced and not something natural to the mind. As such, the principles ordering problem solving constitute the political nature of schooling by partitioning and governing the sensible (and sensitivities). Further, the rules and standards that order pedagogy embody comparative style of thought that differentiates, divides, and establishes differences in how one lives and should live. Today the narratives of the lifelong learner who problem solves differentiates the qualities of others who are spoken of as, for example, at-risk and disadvantaged, with the latter as different from the child who problem solves.

The discussion proceeds first with considering curriculum as converting ordinances, thinking of curriculum as related to Puritan notions of schooling as evangelizing and calculated designs on the souls of readers. The invocation of converting ordinances is to explore internationally the making of curriculum—narratives of national belonging and science coupled with salvation themes that generate cultural theses about modes of living. The early educational sociologies and psychologies of G. Stanley Hall, Edward L. Thorndike, and John

Dewey are discussed in the context of the pedagogy as converting ordinances. The second section discusses U.S. progressive education in a cross-Atlantic Protestant reformism concerned with the social question. The concerns of the social question were given expression in reform efforts. It embodied fears of urban moral disorder at the turn of the 20th century. Welfare policy and the new human sciences were to change the social conditions that also changed people—the poor, immigrants, and others of urban life. U.S. progressivism and progressive education cast the social question in expressions of reforms. The fears were double gestures of exclusion and inclusion. They expressed hopes of a cosmopolitan society and democracy through education; and simultaneously of the threats posed by the dangers and dangerous populations to that future. The final section explores the cultural theses generated in the formation of mathematics, literacy, and music curriculum.

This entry maintains that the history and study of curriculum are not merely the Spenserian question about what is selected, organized, and/or evaluated in schooling. Nor is it sufficient merely to ask the question “whose knowledge is of most worth.” Curriculum embodies particular systems of reason that generate cultural theses about modes of living. The study of curriculum history makes visible the grid of ideas, stories, and institutional practices through which principles are generated about what is known, done, and hoped for. Michel Foucault argues that an effective history is to deprive the self of the reassuring stability of life by uprooting traditional foundations and making fragile introduces discontinuity into our very being through taking what is commonplace and setting that knowledge, emotions, and instincts against itself. History is to cut rather than to understand. In this sense, the history of the present is simultaneously a strategy for curriculum study and curriculum theory.

### **Converting Ordinances: Providential Giving and the School Curriculum**

Schooling is designed to act on the spirit and the body of children and the young. If one looks at French and Portuguese pedagogy at the turn of the 20th century, the pedagogical sciences were constituted to observe and make visible the inner physical and moral life in order to map the spirituality

of the educated subject (the human soul). The new sciences of psychology were central to the design of the child. The French pedagogue Gabriel Compayré in 1885 asserted that pedagogy is an applied psychology and the sources of all the sciences are concerned with moral faculties. Pedagogy was the domain of psychology concerned with all the parts of the soul. The soul (re)visioned European religious concepts of the person as categories of the human mind. Changing the moral and rational qualities of the human mind through pedagogy was to ensure individual happiness and social progress.

The 19th century school was to systematically develop civic virtue in the actions of the individual. The pedagogy of the school, however, was ordered through (re)visioning the processes of the church’s confessional in early U.S. and European schooling. The confessional was a form of religious schooling by the preacher who provided pastoral care for the religious cultivation of the individual. In the new schooling, the catechism style of instruction of the confessional was transported into the state school as a technology of creating patriotic loyalty, morality, and republic civic virtue. The style of educating was to provide instruction in the concrete obligations of the individual and of the individual to others through the use of reason and science.

The catechism of Martin Luther’s Table of Duties, for example, provided a technology for Sweden’s modernizing of schooling until the 1800s. The Table of Duties was founded upon a patriarchal relationship between God and mankind as a father–child relationship in which the weak and sinful child needed education and guidance. Ecclesiastic and political estates were organized in a hierarchy of superiors to the economic estates of families and servants. The catechism of the tables instructed how husbands, wives, children, and common people would learn obedience and moral virtue to the patriarchal hierarchy of the estates. Heavily influenced by the Scottish enlightenment, Swedish moral philosophers presented the common duties of man as doctrines of knowing one’s duties to God, the individual, and to neighbors. Schooling was to provide for moral and civic virtues by producing agents of progress capable of self-guided rational action for the public good. The search for moral perfection also harbored fears about harnessing passions and self-interest that would work against the common good.

Nineteenth-century U.S. pedagogy was related to Puritan notions of education as converting ordinances in forming the greater corporate mission. The curriculum as converting ordinances reflected Puritan concerns with teaching as an evangelizing and calculated design on the souls of their readers. Drawing on John Calvin's notion of *curriculum vitæ*, or a course of life, education was to prepare children for the conversion experience that gave the individual moral behavior. Community was part of one's *curriculum vitæ*. The Puritans, for example, attached the status and attributes of personhood to an inner soul in which the ethical techniques of individual self-monitoring and control—consciousness and self-consciousness—were developed. Reason, logic, and method were learned to find proper restraint and moral behavior necessary for self-fulfillment and for the benefit of society as a whole. The individual's freedom was indivisible from the shared cultural world that gave unity to all of humankind.

The founding of the republic in the later 18th century inscribed pedagogy as converting ordinances. The nation was given providential character to the land and its people (or at least certain parts of its population) through religious phrases: the United States as the new world, its citizen as the chosen people, and manifest destiny. The providential character gave the new nation its exceptionalism in relation to other civilizations. It was the site of escaping the evils, disfigurements, and corruption of Old World Europe. The foundation stories in the beginning of the 20th century renarrated that exceptionalism as the nation as the apotheosis of cosmopolitan reason and the triumph of art and science in the liberation of the human spirit realized by the republic.

The new social and education sciences that emerged in U.S. progressivism embodied the foundation narratives of science and technology. U.S. exceptionalism, for example, was inscribed in the work of Charles Horton Cooley, an early sociologist who wrote about education. Cooley saw the United States as the spirit of the future order that would be totally different from anything before it. Evoking U.S. exceptionalism, Cooley wrote that the new industrial modernity of the United States was the first real democracy and was totally different from anything before it. The greatness of the nation was its emphasis on individuality and

innovation that was possible because the nation did not inherit the class culture and divisions of Old World Europe.

The narratives of the eternal promise of the nation were woven into child development and learning theories. Hall, a major figure in child studies, talked about the nation as the most advanced civilization that brings the completion of history through its ideals of freedom and democracy. For Thorndike, a leading educational psychologist, the goals of education followed the narratives of national exceptionalism. Science was discovering laws about the innate qualities of the individual to enable the U.S. Enlightenment hope of pursuing happiness. Education, Thorndike argued, was to shape the mind and the spirit so the individual can be responsible for her or his progress and trustful of her or his future.

The prophetic vision of exceptionalism was embodied in Dewey's pragmatism. Dewey saw no difference between a universalized notion of Christian values about the good works of the individual and the democracy of the nation. Dewey's prophetic vision of democracy linked the ethics of a generalized Christianity (Calvinism) to the progressive revelation of truth. Christianity as the ethical mode of reflection was embodied in democracy as the individual discovers the unfolding and conditional meaning of life.

The Christian Democracy, as Dewey called it in his early writing, emphasizes the triumph of reason and science in the calling of democracy. Analogous to Christ's teaching, democracy's spiritual meaning was in its notions of freedom as the continuous search for truth through loosening the bonds of tradition, wearing away restrictions of individual growth and development, and the breaking down of barriers and partitions that limit the possibilities of people. This relation of religion to democracy, Dewey argued, was to think of the latter's political process as a mode of life rather than as a machinery of government.

Dewey spoke of pedagogy through the prophetic language of Protestant reformism. Dewey declared that democracy is revelation, using a 19th-century belief in English moderate Calvinism. English Protestant Calvinists replaced rigidness with the coordination of doctrines of reason, natural religion, and revelation. Revelation rested on an awareness of God's accommodation or

condescension to time, place, and particular mentalities in creating the moral good. Democracy as revelation was to promote a mode of living ordered by an open mindedness. Dewey's habits of the mind and notions of problem solving, experimentation, community, and action, central concepts of pragmatism, gave a concrete form to curriculum as revelation and a converting ordinance to secure the possibilities of the future. Science was the process that enabled children to think and act democratically as moral beings in the search for truth in an uncertain world. For Dewey, the scientific method was to free individuals from the unreflective habits produced through subjection to instinct, appetite, and routines.

The educational sociologies and psychologies of progressivism, though having different epistemological relations to the individual and society, overlapped with the commitment to science as planning for the future and pedagogy as converting ordinances. Science, however, operated in two related qualities in the curriculum. First, science calculated and ordered the social administration of change. That planning for change also entered the curriculum as cultural theses about how the child is to and should live in everyday existence. This second quality of science was embedded in the theories of children's learning, development, and growth that ordered pedagogy to generate cultural theses about reflection and action in daily life, such as to learn or to design the future through problem solving. The curriculum, one might argue, made practical and useful scientific ways of thinking (habits of the mind) for ordering immediate and intimate interactions and relations.

### **The Social Question of Progressivism: Science and the Fear of Dangerous Populations**

Important to progressive education and its sciences of pedagogy was the social question. The social question, what German social theorists called *Die Soziale Frage* in the 19th century, focused on the moral disorder and fears of the city. European and North American reform movements were to ameliorate the physical, social, and moral conditions through planned intervention. Reforms would identify the causes of alcoholism, delinquency, and prostitution, among other practices, that violated the presumed norms of civility. Reform efforts

included poor relief, public ownership of urban transportation, city street planning and zoning, wage labor protection, public and modern housing, and mass schooling.

The social question provides a backdrop for the reason that order progressive education. It is not merely of the temporal index of the development of schooling, but within broader international social and cultural formations. Phrased in a democratic rhetoric, progressive schooling was an urban reform movement that responded to and embodied the social question. It was to produce a like-minded U.S. community and to make able, virtuous individuals who give the United States its destiny. The progressive desire for a virtuous society, however, continually inscribed threats to that community. Criticism of the school curriculum brought to the forefront questions about learning the skills and dispositions that would enable urban children to become productive citizens and brought simultaneously fears of the dangers and dangerous populations to the presumed social unity. The high failure rate and pressures on children not able enough, one critic of the teaching of algebra argued, produced pressures that injured the mind of the children, destroyed their health, and wrecked their lives. Others complained about disturbing harmony and consensus through, for example, teaching girls mathematics, which would make them lose their souls and their happiness and contentment in the home.

The pedagogical sciences of education, as part of the emergence of the social sciences, were directed to planning urban life by changing urban populations. The search for civic virtue and its dangers were embodied in Lester Frank Ward's *The Dynamics of Sociology*; he was a founding member of the Chicago School of Sociology and colleague of Dewey. Ward's sociology gave attention to efforts to artificially intervene and civilize the immigrant family. Ward argued that education needs to foster the universal and absolute values that would serve to neutralize noncivilized qualities or there would be a lowering of all of society. Education was to socialize the uncivilized classes and make the savage person whose emotions guide actions into someone who orders life through the reason of the intellect. Edward Ross, in *The Principles of Sociology*, saw the school as the most important instrument to contain the threat of the

growing diversity of the U.S. population. Ross argued that the United States relied on the little red school house to undo immigrants' modes of living and to disseminate the ideas and ideals embodied in U.S. exceptionalism. The social cohesion was to prevent disruptive ideas represented in the Bolshevik revolution or the idea of employers as exploiters. These dividing practices are to be counteracted with the pride in and spread of American ideas.

The moral reform of urban life was placed into psychological registers of pedagogy. Thorndike's studies of children's learning, for example, were bound to the social question. Education was to ensure that children study those subjects in order to provide them with health, to escape poverty, and to have a more decent life including engaging in more decent leisure activities. The good will of men can be created and intensified, Thorndike argued, through identifying the facts and laws that would order how races should be treated, guide the writing of legislation for criminals and their dependents, and to provide care for public health and family. Psychology was influenced by Darwinism in providing a science of the individual that directs statesmanship and social control. Thorndike's psychology incorporated a hereditary view of intelligence that was moral in character and functioned to differentiate races.

The concern with urban life brought into the foreground notions of community in the new sociologies and psychologies of the family and childhood. The notion of community in the Chicago School of Sociology, for example, adapted German social theories about the fall and resurrection of the city as a center of culture, belonging, and home. Embraced was a nostalgic pastoral vision of community where face-to-face interactions of neighbors established trust prior to modernity. That pastoral vision enabled individuals to come closest to nature and God in contrast with modern society where its abstract relations destroyed trust and the moral order. Cooley's concept of community, for example, was a regulatory principle to think patterns of small community interactions in urban relations that would eliminate the alienating qualities of modernity.

Dewey and his Chicago colleague George Herbert Mead placed the individual in processes of mediation and self-realization in domains of community. Mead's social interactionism revised

the pastoral image in an urban idea of community that would not do violence to liberal democratic values. Dewey's notions of intelligent action, problem solving, and community provided a strategy to link individual actions to face-to-face interactions and communications as a mode of life in industrial conditions.

The new sciences of pedagogy through which the curriculum was shaped and fashioned embodied inscriptions to govern individual lives, and to carry out responsibilities that are not only for self-development and growth, but also for standardized public virtues. The invention of a range of technologies enabled the family and the school to inscribe the norms of public duty while not destroying its private authority. These technologies linked public objectives about good health and the moral order of the social body with individual personal health and well-being.

The significance of the science of pedagogy as double gestures was not that it was the intent of the reforms to exclude or abjure. Just the opposite! What is at stake are the rules and standards of reason that ordered different strands of progressive education, such as given expression by Hall, Dewey, and Thorndike. The standards and rules that order the reason of pedagogy inscribed distinctions, differentiations, and divisions in a continuum of values. Schooling and its sciences of curriculum design instantiated a comparative style of thought that differentiated and divided.

### Alchemy of School Subjects

This entry now pursues the previous arguments through examining a central aspect of curriculum, the school subjects. Contemporary U.S. and European teacher education reform focus on the teaching of school subjects as important to improving the quality of teaching and for a more equitable school. The reforms call for teachers to have greater subject content knowledge and pedagogical knowledge. The view of school reform, some argue, takes for granted the system of reason that orders curriculum and its converting ordinances that embody cultural theses about who the child is, should be, and those outside the spaces of normalcy.

The idea of school subjects was, in one sense, an invention of the 19th century. The early decades of the 19th-century school curriculum were linked to

the names of the books read. For example, high school students were to read two books of Caesar and three of Virgil for the study of Latin. Colleges prescribed what books students should read in English for their admission and for the examinations that were given for entrance up to at least 1885. By the first decades of the 20th century, school subjects formed around particular disciplinary knowledge with the new sciences of psychology providing its pedagogical principles.

The changes in the principles organizing school subjects can be considered as analogous to alchemy of 16th- and 17th-century alchemists and occult practitioners who sought to transform base metals into pure gold. Like alchemy, pedagogy is a practice that magically transforms sciences, social science, and humanities into school subjects. Processes of translation are necessary as children are not scientists or concert musicians. What are at issue are the particular inscription devices or intellectual tools that translate and order school subjects.

When examined, the particular rules and standards for teaching school subjects of mathematics, literacy, music, and social studies education had more to do with the converting ordinances of pedagogy rather with pedagogies for learning disciplinary practices. The selection and organization of school subjects was, at one level, to bestow moral grace on the nation and the promise of progress. Although seeming far-fetched today, school textbooks in the 19th century taught geometry and chemistry as bringing progress to the lands of the west through their use in mining and smelting. Chemistry, wrote Edward L. Youman, a founder of *Popular Science Monthly*, taught individuals to be industrious through connecting science to daily experience and its conditions of life and death. The sciences, Youman argued, make visible the sublime plan by which God created and manages the world. Geology taught the truths of Genesis, and zoology provided learning of classifications that placed man at the top of nature's hierarchy. Children's understanding of scientific laws was to bring people closer to God and to increase their productivity through their learning about how life and death were shaped through the chemical process that started life and ended with dust.

With the turn of the 20th century, secular themes of salvation were embodied in school subjects. The curriculum of science, mathematics, literature, and

history were to improve mankind and develop a world community centered from the narratives of the nation and salvation themes of Protestant reformism. Mathematics education, for example, was seen as a practical subject that students needed for understanding everyday activities as well as necessary for practical pursuits of building homes, roads, and trade. Studies of arithmetic were to enable democracy to work through enabling people in the pursuit of happiness. Arithmetic provided a way to order life through bringing scientific reasoning and give relevance to the world through the logic of mathematical relations.

The teaching of school subjects in mass schooling was opened up to the inarticulate and illiterate of the working classes and immigrants. Thomas Jesse Jones, associated with the urban settlement house movement to assist immigrant and poor populations and chair of the 1916 report *The Social Studies in Secondary Education*, spoke optimistically of the "Negro and Indian races" as not being able to develop properly, but now able to do so through education. English as a subject in the English school has a similar historical trajectory. It was related to the governmental provisions for social welfare. The narrative structures and ethical messages of literary texts were to help the reader become a moral agent who embodied cosmopolitan values of civility. The rules of moral conduct were accomplished by making the stories of literature relevant to the everyday experiences of working-class children. Relevancy was to show how the rules and standards for moral conduct could be practiced in daily life.

Seemingly with different public priorities than science and social studies, the inception of school music in Boston during the 1830s linked the tradition of singing in Prussian schools to the governance of the urban child. Horace Mann, secretary of the newly created Massachusetts Board of Education, wrote in his 1844 "Report to the Boston School Committee" that the harmony of song in vocal instruction provided the child with the model for the child's own self-regulation in society. Mann discussed music education in relation to the risks of epidemic disease. Vocal instruction was to provide regimens to stimulate circulation that would give moral as well as physical health to poor urban populations. Teaching the proper songs would remove the emotionalism of tavern

and revival meetings and regulate the moral conditions of urban life with a higher calling related to the nation.

Music appreciation joined vocal instruction by the beginning of the 20th century. The curriculum was to eliminate juvenile delinquency, among other evils of society. Its prescriptions for comportment entailed the avoidance of degenerate characteristics associated with racial and immigrant populations. Physiological psychology about the proper amount of stimulation for the brain and body was coupled with notions of musical aesthetics, religious beliefs, and civic virtue. Singing, for example, was to give expression to the home life of industriousness and patriotism that was set against racial stereotypes of Blacks and immigrants. Minstrelsy, a satiric version of Black music and spirituals, was contrasted with the complexity of music of European civilization. A medical expert in the 1920s, employed by the Philadelphia High School for Girls, described jazz (by this time a rubric that included ragtime) as causing disease in young girls and society as a whole. Psychology was deployed to create a scale of value that compared immature or primitive humans' development with those of fully endowed capacity that corresponded to race and nationality. The attentive listener was one who embodied the cosmopolitan mode of the civilized life. In teaching manuals, the child who did not learn to listen to the music in a particular way was "distracted", a determinate category bound to moral and social distinctions about the child as a drifter, a name caller, a gang joiner, a juvenile offender, a joke maker, or a potential religious fanatic, having acute emotional stress and an intense interest in sex.

### The History in the Study of Curriculum

The focus on the system of reason is to make visible the overlapping of salvation narratives, sciences of the child, and providential quality of the nation in the curriculum. These different historical practices come together in the curriculum as cultural theses about modes of life. Further, curriculum embodied a comparative style of thought that generated double gestures of cosmopolitan hope for and fear of the dangerous populations. The study of curriculum as systems of reason also provides a strategy which to see the conditions that

connect and made possible different historical icons such as Hall, Dewey, and Thorndike.

The history of the present is a strategy to consider the very foundations of the present that are taken for granted and accepted as natural and inevitable. The possibilities of change are in locating the continuities and discontinuities in the rules and standards of reason. The double gesture of hope and fear, for example, brings to the surface the cultural theses that govern the present. This double gesture is spoken about today through the phrase that all children can learn. The *all* (re)visions the social question through recognizing and making difference. The intent of such phrases is for an equitable society. The unity of the whole inscribed in the word *all* instantiates and divides all children from the child who is urban, at risk, disadvantaged, and the immigrant.

This moving to the present, however, are not to suggest the repeating and replicating of the double gestures of the social question. The historical trajectories of today are not the sum of the parts, nor is there a singular evolutionary origin. Today's reason has different assemblies, connections and disconnections in the making of the child and differences.

The rules and standards of reason are the political of schooling. The political is embodied in the partitioning of the sensible as the distinctions and differentiations of the curriculum ordered what was seen, thought about, and acted on. This notion of the political is given expression by the anthropologist Paul Rabinow. Knowledge, he argues, is simultaneously conceptual, political, ethical, and aesthetic. It is conceptual in that one needs concepts to order and classify what is thought about and looked at. It is political in the sense that thought is directed to acting on life and the categories and distinctions of thought are made possible by social conditions. That practice of reflection may be singular, but it is never merely of the individual. Thought embodies the historical conditions in which thought is made possible. Knowledge is ethical, he continues, as it entails questions about what is good in life. And finally, all action is aesthetic as it is shaped and presented to others.

Although the focus was on the U.S. progressive education reforms, the reason of curriculum as converting ordinances was not merely a national phenomenon, but circulated in the formation of

the modern school, albeit with different sets of principles and historical connections. Focusing historically on the rules and standards of reason is a strategy to see the limits of the present through making observable the principles governing what is known, seen, and acted on.

## CURRICULUM, THE

---

John Franklin Bobbitt's *The Curriculum*, appearing in 1918, was the first book published in the United States on the subject of curriculum. It is the most frequently cited book on curriculum in the field of U.S. educational history.

When he published the book, Bobbitt was a professor of educational administration at the University of Chicago. He completed his PhD degree in education at Clark University in 1909 and then accepted a position at the University of Chicago, where he remained until his retirement in 1941. *The Curriculum* was heavily influenced

by the industrial context in which it was written. Bobbitt based his views on the work of Frederick Winslow Taylor, specifically his book *Principles of Scientific Management*. Taylor's text, published in 1911, was written to make industrial plants more efficient by generating more production from workers. Taylor advocated the use of time and motion studies, empirical research, and top-down management. Although intended for use primarily in industry (particularly steel plants), advocates of Taylor's system applied his views to numerous fields such as medicine, agriculture, and even the ministry. Bobbitt's *The Curriculum* was the first book to take Taylor's methods and apply them to curriculum.

Bobbitt begins the book by discussing contemporary controversies surrounding educational philosophy. He discusses two views that he sees vying for control over the purpose of schooling, one based on culture and the other based on utility. Proponents of culture as the end of education, says Bobbitt, argue that the goal of education should be to cultivate citizens who have the ability to live. These educators want to emphasize learning for its own sake and the strengthening of the powers of the mind. They also have little concern for utility or the practical outcomes of schooling. On the other hand, supporters of utility as the end of education propose that the goal of education is to create students who have the ability to produce. These advocates assert that schools should prepare students to perform their daily activities efficiently, so as to create practical citizens who can cooperate with their fellow citizens in effective and cooperative ways. Bobbitt states that both of these views hold value, but a complete reading of his book indicates that he was clearly on the side of those who favored utility. In the battles waged over the purpose of education, *The Curriculum*, in fact, was one of the most powerful books from the 20th century on the side of vocational training.

The most enduring aspect of *The Curriculum* can be found in his chapter titled "Scientific Method in Curriculum-Making." Bobbitt's plan has been repeated countless times, albeit in slightly different forms, since the time he published it. It can be summarized in five steps. The first is to study the daily activities of adults. The basis for curriculum is found in what adults do every day. Curriculum workers (or discoverers, as Bobbitt

calls them) are to study adult activities in order to catalogue what they do, including the knowledge they possess, the terms they use, the problems they solve, the skills they employ, and the ambitions they exhibit. In deciding who to study, curriculum workers, moreover, are to find the most efficient adults, not just anyone. The second step is to take the information that curriculumists have collected and prioritize this information into objectives for the schools. Third, curriculumists are to identify the students who, based upon ability and interest, will most likely fulfill the various adult roles upon graduation. Fourth, once these students have been identified using intelligence tests or other means, the curriculum is differentiated for each group of students so as to train them for their adult roles. Finally, curriculum specialists are to study students once they have become adults to assess whether or not the curriculum they completed prepared them efficiently for their daily activities. This evaluation is then taken into account when devising future curriculum plans.

*The Curriculum* was popular in the eyes of many educational reformers, but it also received criticism. Critics claimed that Bobbitt narrowed the ends of education by focusing so heavily on occupational training. Critics also charged that Bobbitt relied too heavily on the current activities of adults and thereby left little or no room for social change. In a book he published in 1941, *Curriculum of Modern Education*, Bobbitt acknowledged these shortcomings and even repudiated much of what he argued in *The Curriculum*. Nevertheless, the system he describes in the book has remained influential for almost a century.

## CURRICULUM AND PEDAGOGY CONFERENCE

---

The Curriculum and Pedagogy Conference is a small North American conference with the stated goal of bringing together curriculum theory with curriculum practice, academic discourse with the discourse of K–12 school practitioners, and teacher educators with teachers, school administrators, and graduate students and doing so through larger themes of the arts, social justice, and public moral leadership. In addition to these goals for the content of the conference, organizers also sought to ensure that the process of running the conference reflected democratic values through elections, transparency of finances, and procedures. It was organized by a small group of curriculum scholars including James Sears, Dan Marshall, Jim Henderson, Kathleen Kesson, Patrick Slattery, Kris Sloan, Louise Allen, Tom Kelly, and Susan Edgerton, as an outgrowth of the Conference for Curriculum Theorizing (also known as Bergamo Conference) and in collaboration with the Arts-Based Research in Education special interest group from the American Educational Research Association, Division B, Curriculum.

The first conference took place in October 2000 and was held at Camp Balcones Springs Retreat and Conference Center outside of Austin, Texas. Since that time it has been held annually at several different locations, usually in October. The conference moves to a new location every other year. Revenue comes from registration and membership fees, which include the price of the published proceedings, and from sponsorship of various academic institutions that change from year to year.

Each year the conference selects a theme. For example, the title for 2001 was “In(Ex)clusion: (Re)visioning the Democratic Ideal.” Each year’s conference is further organized into strands, with the 2001 strands being collaborative writing project, social action project, and arts-based research project. The title for 2008 was “Complicated Conversations and Confirmed Commitments: Revitalizing Education for Democracy,” which was concerned, in part, with the conflict between discourses of standardization and the values of progressive education for democratic values. Strands that accompanied this theme were arts and

alternative inquiry for social change, mentoring, public moral leadership, social action then and now, theory in motion, transformative curriculum development, and making meaning of research, measurement, and assessment.

The conference has also published a book each year with Educators International Press consisting of selected, peer-reviewed papers or presentations based on the year's conference theme. An elected governing council selects the coeditors of the book each year on the basis of submitted proposals. A new peer review committee is also selected each year. The conference also sponsors the *Journal of Curriculum and Pedagogy*, which has been published twice a year since 2004.

## CURRICULUM AND TEACHING DIALOGUE

---

*Curriculum and Teaching Dialogue* is a scholarly journal of the American Association for Teaching and Curriculum. As such, it is one of several key journals that advance curriculum studies through provision of refereed articles on curriculum studies. Other major journals that deal exclusively

with curriculum studies are *Journal of Curriculum and Pedagogy*, *Curriculum Inquiry*, *Journal of Curriculum Theorizing*, and *Journal of Curriculum Studies*. *Curriculum and Teaching Dialogue* began to be published in 1998 and emphasizes five types of manuscripts: selected conference papers, open submission papers, book reviews, letters to the editor, and a dialogue column.

The journal guidelines for submitting manuscripts include the following: one original hard copy of the manuscript with the title, submission category, name, and contact information of the author; one abstract of 75 words or less; biographies of the authors; an electronic copy of the manuscript, abstract, and biography (in Word format) sent via e-mail to [ctdjournal@jmu.edu](mailto:ctdjournal@jmu.edu); use of a 12-point font, double-spaced text, and page limits depending on category of submission; references in American Psychological Association style; any tables, figures, or graphs should be attached at the end of the manuscript with specific program used to create them noted and with place in manuscript indicated; and a self-addressed, stamped envelope for notification of manuscript arrival.

This journal's uniqueness is that it acknowledges a transactional quality between curriculum and teaching that is captured by the term *dialogue*. This assumption holds that curricular attributes are embedded within teaching and that teaching implicitly and explicitly embodies curricular positions. In order to understand curriculum and teaching, curriculum studies must explore the dynamic interplay between these two powerful conceptions in theory and in action. Pieces published in *Curriculum and Teaching Dialogue* focus on exploration and inquiry pertaining to such matters.

## CURRICULUM AS PUBLIC SPACES

---

Curriculum as public space can be thought of as an attempt to broaden the sense of education in a way such that every member of society can develop and use all of his or her capacities and powers without

infringing upon the basic conditions or rights of others. The classroom—society itself—becomes an association in which the free development of each is the condition for the free development of all.

In 1963, a young civil rights worker proposed to create a network of Freedom Schools across the South as a way to re-energize and refocus the civil rights movement. He noted that although Black people had been denied many things—decent facilities, fully trained teachers, forward-looking curriculum—the fundamental injury was a denial of the right to think for themselves about the conditions of their lives, how they came to be the way they were, and how they might be changed. This idea initiated a public curriculum of questions: Why are we in the freedom movement? What do we want that we do not have? What do we have that we want to keep? Pursuing these questions, teachers taught the three R's (reading, writing, and arithmetic) and so much more: how to take oneself seriously as a thinking person; how to locate one's life in the contexts of culture and history, political power, and economic condition; and how to imagine and then actively work toward a new society.

Over the next several years Freedom Schools were launched all over the country, and not just in schools, but in community centers, churches, parks, and coffee shops—in fact, in any space where people gathered together to face one another in dialogue. It was sometimes wild and unruly, always noisy and diverse, and yet it had several common edges: teachers and leaders became students of their students, the extraordinary ordinary people; students were active participants in their own learning rather than the inert and passive receptacles of someone else's ideas; consumers became citizens and objectified people transformed themselves into subjects and history makers; teaching and learning was recast as having a larger purpose than occupational training—the fullest participation possible in the world we share, including the development of capacities to change ourselves and to change that world. People got a taste then of curriculum as public space, curriculum characterized by its open access and its propulsive midwifery properties.

In many ways, Martin Luther King, Jr. was the emblematic practitioner of curriculum as public space. He performed on a vast stage, and indeed his classroom was all of society; he asked in a thousand ways what was of most value, what was

fair and just; he urged voyages and transformations for himself and for participants in the Black freedom movement and for all within the sound of his voice or the sight of his activities; he grew and changed as conditions evolved and developed.

Curriculum is, of course, never neutral—it always has a value, a position, and a politics. For humanists, the value of education and curriculum is its identity with the general quest for human enlightenment and human liberation. Its driving principle is the unity of all humanity, the conviction that every human being is of incalculable value, entitled to decent and universal standards concerning freedom and justice and education, and that any violations, deliberate or inadvertent, must be resisted.

The relationship between education, curriculum, and freedom is deep, intrinsic, and profound—they are essentially the same thing. Both concern themselves with the fullest expression of human development. To the extent that people reflect upon their lives and become more conscious of themselves as actors in the world, they insert themselves as subjects in history, constructors of the human world, and they enact and express themselves, then, as free human beings.

Curriculum and education are arenas of struggle as well as hope—struggle because they stir in us the need to look at the world anew, to question what we have created, to wonder what is worthwhile for human beings to know and experience—and hope because they gesture toward the future, toward the impending, toward the coming of the new. This is where we ask how we might engage, enlarge, and change our lives, and it is, then, where we confront our dreams and struggle over notions of the good life, where we try to comprehend, apprehend, or possibly even change the world. Curriculum as public space is a natural site of contestation—sometimes restrained, other times in full eruption—over questions of justice.

## CURRICULUM AS SPIRITUAL EXPERIENCE

---

The phrase “curriculum as spiritual experience” can be defined as whatever brings an individual into heightened awareness of her or his relationship with the Infinite, the reality that lies beyond all thinking. However, many other definitions are both possible and plausible, depending on differing points of view about underlying ideas, beliefs, and assumptions.

The curriculum is commonly conceived as identical to or synonymous with the course of study, a body of material presented to the student to learn. As such, it is something that can be planned and written down, can remain forever unchanging, and can exist independently of the consciousness of the student. However, as John Dewey made clear during the first half of the 20th century, the curriculum can also be conceived in a deeper way, as the experience of the student in response to the course of study (or, in a larger sense, in response to the entire environment of the school, or even in the largest possible sense, in response to everything that happens to an individual throughout an entire lifetime). In this latter conception, the curriculum is the individual, ever-changing, and sometimes conscious experience of the student. A major dilemma for the field of curriculum studies lies in determining which of these two concepts to adopt. What, for example, is gained and lost by each? Can, in fact, both concepts of curriculum be held simultaneously or sequentially? What do such questions about the fundamental nature of curriculum studies imply about classroom practice?

All curriculum is experience, and all experience is spiritual. This statement is not conjecture based on Dewey. It is true because any curriculum is a way of apprehending the world, and all ways of apprehending the world are incomplete. Thus, there is always some sense of mystery about experience, something that is beyond human perceptions or ability to comprehend, such as the infinitude of time and space within which each person lives a finite life. Spiritual experience—or

more simply, spirituality—is that part of one’s life that brings one into increasing awareness of one’s relationship with the Infinite. The relationship is always there, within the mystery of individual experience whether one is aware of it or not. The task of any specific curriculum is to draw the student into a deepening awareness of the student’s relationship with the Infinite, reality, God, or any other name one chooses to put upon that fundamental, underlying truth about living. Depending on the dispositions of individual students, this task may be approached in a variety of ways. For instance, one student may be captured by the beauty and logic of mathematics; another, by the complexities of Shakespeare’s worldview.

To be spiritual means three things: being in a relationship, being aware of that relationship, and being open to change because of that relationship. The relationship is with the Infinite, of course, the never-ending expanse of time and space, of everything beyond oneself that cannot be fully comprehended rationally. Some people recognize the relationship more directly and fully than do others. Those who most recognize the relationship stand in awe before the ultimate mysteries of the universe. When this recognition has reached a sufficient level of intensity, that which may have been recognized intuitively and directly may become conscious awareness. As Maxine Greene has pointed out for curriculum studies, intuitive experience, conscious experience, and aesthetic experience can merge into one grand way of comprehending reality. Therefore, curriculum studies must conceive itself as comprehensively as possible and remain ever-attentive to how students may be led toward increasingly transcendent forms of experiencing.

Conscious awareness of this spiritual relationship, therefore, opens the individual to change, an inevitability of living. Among writers within curriculum studies, Dwayne Huebner has most profoundly described the full sequence of relationship, awareness, and change, noting that the curriculum should provide opportunities for students to encounter Otherness, the potentially frightening unknown, but which, once embraced, leads on to ever-deeper transformations of experience.

## CURRICULUM AUDITING

---

Curriculum auditing refers to the practices, language, and values of audit culture as these are applied to curriculum, defined as the design, delivery, and evaluation of the formal content of K–higher education. Although the first known use of a curriculum audit, titled an educational performance audit, occurred in 1979 in the Columbus, Ohio, school district, curriculum auditing was initially formulated in the early 1970s as a way to establish public trust in schools by introducing auditing practices used in financial sectors. These practices were meant to ensure objectivity in evaluating the efficiency and performance of school curriculum. A curriculum audit replaces questions about the truth, beauty, and goodness of a curriculum and its social and political context, with questions about the planning, evaluation, effectiveness, and efficiency of the curriculum. In other words, a curriculum audit does not concern itself with the content or context of curriculum, but with how and to what extent curriculum is developed and successfully implemented. Furthermore, the measures used to monitor implementation and determine success are numerical and require the emplacement of a regulatory system that monitors the system itself. In other words, not only must there be in place practices that generate numerical data, but a self-monitoring system must exist to aggregate, disaggregate, make sense of, and employ the data produced to improve the curriculum and its delivery.

Informed by effective-schools research and organizational theory, both of which evaluate school practices and policies in terms of curriculum design and delivery and draw conclusions about curriculum quality control, a curriculum

audit typically involves monitoring the extent to which particular standards are met. These standards are generally phrased in terms of the following: control, which refers to the clarity and flow of information within the overall chain of command of a school's curricular decision-making process; curricular direction, which refers to the overarching and specific performance objectives designated within and shaping the curriculum; connectivity and equity, which refer generally to the alignment between policy and operation and more specifically the alignment among courses, methods, outcomes, and to the equitable division of resources among all students; feedback or assessment, which refers to the data aggregation system that provides feedback and drives curricular decisions; and production, which refers to the extent to which the budget is driven by curricular needs.

A curriculum audit measures to what extent these standards are met. In order to measure success, each standard is broken down into discrete elements that can be measured. In other words, to answer, for example, whether there is proof that the chain of command used data generated by assessments to improve the curriculum, there needs to be evidence not only of change in curriculum but improvement based on quantitative data. To determine whether courses are aligned such that performance indicators incrementally demand more at each grade level, evidence must be produced of syllabi including performance objectives and of developmental consistency of objectives across grade level. To show that a feedback loop is in place such that teachers can benefit from data produced by standardized assessments, interpreted within the chain of command and returned to those teachers, improvement across time on scores on individually benchmarked assessments might be asked for.

Some curriculum theorists have been critical of curriculum audits for several reasons. They argue that the emphasis on performance indicators that can produce numerical data leads to an overdependence on tests as assessments. They suggest that a curriculum audit is part of the larger audit culture that promotes and is informed by neoliberal and free market economic interests that contradict the ideals of public education. They suggest that by applying fiduciary auditing practices to the curriculum, the curriculum audit reduces knowledge and

learning to information, test performance, and numbers. They argue curricular audits perpetuate instrumental and bureaucratic logics that sacrifice content for efficiency and privilege a cost-benefit analysis of curriculum. Finally, they argue that contrary to the objectivity claimed by supporters of curricular audits, a curriculum audit elides the historical, political, ethical, aesthetic, and social influences shaping the curriculum and thus perpetuates the status quo. Proponents of the curriculum audit counter that standards and accountability are central to developing the curriculum and that because the best approach to the curriculum continues to utilize versions of the Tyler Rationale, a scope and sequence approach, and performance outcomes, a curriculum audit that measures these remains the most efficient way to evaluate curriculum.

## CURRICULUM BOOKS

---

Surely it is must be a daunting task to write about 100 years of curriculum books. But in the second edition of their seminal work, *Curriculum Books*, William H. Schubert, Ann Lynn Lopez Schubert, Thomas P. Thomas, and Wayne M. Carroll offer at once a masterful resource for those studying curriculum literature while at the same time providing scholars and practitioners with a reflective work on the study of curriculum as grounded in social history. Each chapter of the book details a

decade of curriculum history combining the information along with the social, political, and the cultural events of the time period. The first edition also presents a categorization of three dominant schools of curriculum thought and a fourth category was added in the second edition. These schools of thought remain as viable today in analyzing schooling in general and curriculum work in general.

The authors set forth in their introduction the premise that curriculum is focused on the human journey that produces learning as a result. In addition, they state that the work puts forth a historical consciousness for curriculum inquiry. They ask the reader to consider the needs of learners and the content of the activity that can help them acquire the experiences that will prompt further learning. This type of learning then should ideally result in not right answers but rather in providing insights to further points of inquiry and to more questions. They end their introduction with a series of queries that are even more poignant today than when the second edition was published in 2002, culminating with this point: Will there continue to be histories about curriculum thought in the twenty-first century?

Given the political environment that has engulfed public education since the last decade of the 20th century, the view of curriculum thought between the scholar and practitioner is now as wide a chasm as ever when examined within the context of the field's history of the past 100 years. Schooling has been co-opted by the corporatization of U.S. education through book publishers, testing companies, and the federal government's No Child Left Behind Act (NCLB) that has now established that learning is all about taking a test and getting the one right answer. Many see education and by extension, curriculum, as ripe for change. Educational management organizations are often touted as the answer for underperforming schools in poor school districts, with the emphasis on financial returns rather than on learning and developing students as critical members of society. Perhaps ironically, the various schools of curriculum thought still tend to be in evidence today—some more so than others, especially the social behaviorist tradition because there has been an obvious bonanza for testing and publishing companies that create test-taking packages as well as supplemental service providers such as

Sylvan and Kaplan, whose revenue has doubled since NCLB was passed.

In this environment, there is no room for multiple questions or multiple right answers. The power and influence for crafting lessons and curriculum now rests with those far removed from the classroom. Even when practitioners confront some version of curriculum study in a graduate program, many are confounded by its lack of specificity, its lack of one and only one definition of curriculum, and initially see no connection between schooling and democracy. They seek what has come to be the comfort of the chains of standards, testing, and pacing guides that regiment their times with students in bowing to the all-mighty achievement test.

In considering the current state of curriculum, one then might answer the authors that there will be few, if any, histories about curriculum in the 21st century. But if we believe that curriculum is focused on the human journey, then we know the information age offers hope because there are so many new avenues other than schools through which to acquire knowledge: television, the Internet, video, music, the arts, and museums. To remain a practical field, then, in this century and beyond, curriculum workers must keep alive the questions of what is worth knowing, doing, and being with the greater quest being how to learn to live a moral and just life with others. Yes, there will be curriculum histories but they will likely have a broader vision of schooling than the first 100 years of the field has done.

## CURRICULUM CANADA, PROCEEDINGS OF THE CANADIAN ASSOCIATION FOR CURRICULUM STUDIES

---

Curriculum Canada, Proceedings of the Canadian Association for Curriculum Studies is a publication series of selected papers presented by curriculum researchers at Curriculum Canada national invitational symposia. The main objective of the symposia was to stimulate and foster focused discussion and debate on the field of curriculum studies in particular relation to the context of Canada. The symposia and the published proceedings are significant for the field of curriculum studies, because they represent a concerted departure by Canadian curriculum scholars from foreign curriculum models. Within the symposia and their proceedings, curriculum scholars highlighted locally meaningful definitions of curriculum and the field of curriculum studies, illustrated various methodologies for conducting curriculum research, considered some of the challenges of curriculum practice and theory in Canada, and disseminated findings of Canadian curriculum inquiry.

The Canadian Association for Curriculum Studies sponsored seven Curriculum Canada symposia between 1979 and 1986 in conjunction with funding support from the Social Sciences and Humanities Research Council of Canada. The symposia aimed to provide an independent and informal national venue for dialogue among curriculum scholars, and invited participants represented a cross-section of universities in Canada that spanned across the Canadian provinces. Participants at the later symposia also included members of boards of education and professional organizations for teachers. The symposia and their proceedings endeavored to include contributions in French and English from both Anglophone and Francophone curriculum specialists.

The proceedings of the Curriculum Canada symposia of the Canadian Association for Curriculum Studies were published following each symposium. The titles of the seven texts are *Curriculum Canada: Perceptions, Practices, Prospects*; *Curriculum Canada II: Curriculum Policy and Curriculum Development*; *Curriculum*

*Canada III: Curriculum Research and Development and Critical Student Outcomes; Curriculum Canada IV: Insiders' Realities, Outsiders' Dreams: Prospects for Curriculum Change; Curriculum Canada V: School Subject Research and Curriculum/Instruction Theory; Curriculum Canada VI: Alternative Research Perspectives: The Secondary School Curriculum; and Curriculum Canada VII: Understanding Curriculum as Lived.* Overall, the published series of proceedings present deliberations over an array of pertinent issues in curriculum studies from a diversity of Canadian vantages.

To trace how curriculum changes, one must understand the evolution of the field itself. It was born during the early 20th century when control, management, and measurement were the driving forces in various academic fields, such as political science, sociology and the natural sciences. Its early leaders, John Franklin Bobbitt and William Charters, presented the field as a science based upon empirical studies with objective results. Showcasing how curriculum could be a process for meeting society's needs, Bobbitt's work, *The Curriculum*, was viewed as a scientific contribution to U.S. education. The study of curriculum then slowly became a field populated by scholars who eventually viewed it from different perspectives.

The seeds of this growth were actually fermented in the progressive reform movements of the 1890s as the country went through massive changes in its social, cultural, and economic foundations. Civic leaders and educators slowly recognized these great seismic shifts and how they were impacting schools and schooling. The country was becoming increasingly urban as people left the rural farms behind to seek work in the factories of the Northeast and Midwest. This increasing industrialization, along with both mass journalism and railroads, was penetrating every town, village, and hamlet across the country. At the same time, the country had to absorb 14 million new immigrants, and they were quite unlike the original settlers who were White, Anglo-Saxon, and Protestant. These newcomers did not look like, sound like, nor believe like those who already lived here.

Therefore, school became an important institution that served as a mediator between the family and the shifting social and cultural worlds of the changing cities and towns. It became the place where norms and values would be taught by and through the curriculum. Because curriculum is at the heart of schooling, it has changed over the past 100 years as the various forces have battled for dominance in deciding what should be taught, to whom, and when.

Leaders of the various schools of curriculum thought viewed it from the perspective that schools should focus on what was good for society, or what was good for the child, or what subject or discipline was more important for an educated person, or lastly, how a combination of each of these factors, the child, the subject, and the society,

---

## CURRICULUM CHANGE

---

In order for schools and curricula to be responsive to new students and new societal conditions, scholars and practitioners alike must also understand the forces of change and how those forces impact and shape the curriculum.

would work best. There are many curriculum scholars who worked from within just one perspective and whose work had great impact on the field, but there are two whose scholarship and influence is so important that they have transcended the times and are still seen as preeminent in curriculum work today.

One of these is Bobbitt's student at the University of Chicago, Ralph Tyler, who developed a curriculum planning model in 1949 that is still being used today. Tyler was a scientist and believed that you could measure all activities and outcomes in education, and his Tyler Rationale is representative of that philosophy. In stark contrast to Tyler is John Dewey. Dewey was a contemporary of Bobbitt, and his scholarship was based upon his work at The Laboratory School at the University of Chicago where he watched children learn from tasks set up in model communities.

Each of these men then represent two contrasting views of curriculum: Tyler focused on behavioral objectives in the curriculum planning process and came to symbolize the school of curriculum thought known as social efficiency. Dewey, on the other hand, believed that schools were where the U.S. ideal of democracy should be taught, modeled, and lived. He saw the school as an embryonic community where children could learn skills experientially from books as well as from working cooperatively together in a democratic society. Rather than focusing on behavioral objectives as Tyler did, Dewey concluded that individual learning was important not only for the sake of each child, but it was even more important for the good of the community. Although some educational historians classify Dewey as a progressive educator, and others saw him as a social meliorist or social reconstructionist, he rejected such labels.

As noted earlier, the curriculum first came into focus during times of great change in the country, during the 1890s. From then until the late 1920s school leaders and university professors were in a tug-of-war with local businessmen who came to dominate local school boards. The business mindset became the mantra for fixing the curriculum, fixing the schools, and fixing the students. Once the Great Depression arrived, the corporate world had less impact upon schools where educators once again crafted curriculum in ways that met the needs of the students and the community. After World War II,

public schools were again under attack as not preparing students for the workforce. And by 1983, when *A Nation at Risk* was published, the stage was set for reform that would eventually reach far beyond just the corporate definition of schools, but to federal intervention into the curriculum.

With the 21st-century emphasis on high-stakes testing and accountability, there is a nationwide trend toward reducing the curriculum to only subjects that are being tested. If it is not tested, then the subject tends not to get taught. The curricular content is now determined more by high-stakes tests than by students' needs and interests. So once again, we see a curriculum change based upon who is in control of the schools.

## CURRICULUM CONSTRUCTION

---

W. W. Charters's *Curriculum Construction* was among a handful of books that pioneered the emerging field of curriculum studies during the first few decades of the 20th century. *Curriculum Construction* became popular with advocates of vocational training and others who were seeking to establish an empirical basis for professions ranging from nursing to teaching to pharmacy. Charters completed his PhD degree in education at

the University of Chicago in 1904 where John Dewey supervised his dissertation. He later served as a professor of education and educational researcher at numerous universities, including the University of Missouri, the Carnegie Institute of Technology, the University of Pittsburgh, the University of Chicago, and Ohio State University. In *Curriculum Construction*, Charters applied the new social science techniques that were sweeping fields such as economics and political science to the field of curriculum.

A thoroughgoing advocate of evolutionary theory and specialized training for occupations, Charters was part of the larger progressive education movement that held considerable power during the 1910s and 1920s. Throughout *Curriculum Construction*, Charters argues against the traditional view that curriculum should be rooted in the conventional subject matter disciplines. Instead, he argues that curriculum should be tied to the various occupations and adult activities that citizens perform during their daily lives. Subjects are only as good as they help us to complete our daily activities more efficiently. Like his one-time University of Chicago colleague John Franklin Bobbitt, Charters was a strong advocate of vocational training in K–12 schools and in universities. Charters argues that curriculum development should begin with activity analysis, which involves the exhaustive study of adult activities in order to create curriculum content. The empirically based plan for activity analysis that Charters describes in *Curriculum Construction* was used in dozens of professional fields, including nursing, pharmacy, and construction. Charters himself applied his system of activity analysis to the profession of teaching in a major study called the Commonwealth Teacher Training Study, which was funded by the Commonwealth Fund. The study resulted in the publication of a book, *The Commonwealth Teacher-Training Study*, that includes “Master List of 1001 Teacher Traits.” Charters argues that these traits, which were based upon the system that he outlines in *Curriculum Construction*, should become the basis for teacher training curriculum throughout the country.

*Curriculum Construction* is divided into two parts. The first includes a detailed description of Charters’s method of curriculum development and planning. He discusses the role of ideals in

curriculum making, how to analyze activities to determine their most essential components, and how to determine the relative importance of different pieces of curriculum content. To increase his audience and the influence of the book, Charters included examples that relate to elementary schools, high schools, and universities. In part two, Charters draws upon the work of curriculum specialists and practitioners, for example superintendents, to describe the best methods for creating curriculum in the various subject matter fields. He includes separate sections on the subjects of mathematics, language, history, geography, vocational training, and spelling. Charters’s goal with the second part of the book was to provide curriculum developers with the best techniques available for creating curriculum in these various fields.

The view of psychology that Charters advocates in *Curriculum Construction* is also significant. He was on the cutting edge of changes in psychology. He strongly criticizes the idea of formal discipline, which held that traditional subjects such as mathematics and Latin trained the mind to think in powerful ways, specifically strengthening the ability to reason. Proponents of formal discipline believed that reasoning ability, once it had been strengthened by the traditional subjects, could be transferred to other areas of human life. Charters rejected this view in favor of the new functional psychology that emphasized evolutionary development and measurable behaviors, not eternal ideals or the training of the mind.

Critics of *Curriculum Construction* (and Charters’s work as a whole) claimed that he overemphasized the utilitarian aspect of knowledge and simultaneously diminished the role of traditional subjects in the curriculum. Critics also claimed that Charters relied too heavily on the empirical aspects of curriculum and teaching, thereby destroying the idea of curriculum making and teaching as forms of art.

## CURRICULUM DESIGN

---

A curriculum is a series of activities in which students engage with subject matter. Because everything cannot be studied at once, these activities must be orchestrated in some way. This arrangement is called curriculum design. Whether the subject is geometry, visual arts, or map skills, it is arranged in ways that emphasize some aspects and implications of the subject and neglect others. In this way, curriculum design is among the most powerful tools educators can use to influence what students learn.

Curriculum design can be viewed as an arrangement of materials prepared in advance and intended for instruction. Alternately, it can be considered as what emerges from interactions among teachers, students, and materials. In either case, however, a given design suggests conscious planning and brings with it a predisposition to what subject matter and instructional arrangements count as educationally significant.

No definitive taxonomy of curriculum designs exists. Several design types, which are among the best known, are considered here: school subjects, social, personal relevance, and intellectual development. John Dewey's ideas on design are included, too, because of both their lasting impression on curriculum thought and to cast other designs into relief. Finally, the hidden curriculum is briefly considered.

### School Subject Designs

The school-subject approach has a long lineage. Its familiarity, however, can mask shifts in what counts as a subject or an academic discipline as well as its boundaries with other subjects. By the 1890s, for instance, progressive thinkers were referring to the old education giving way to the new. The latter both brought in new subjects and

redefined old ones. For example, living languages such as French and German were introduced alongside Latin and ancient Greek, much of what had been considered geography in the 19th century was annexed by history, and the sciences of physics and chemistry, with laboratory methods extolled, entered the curriculum. Such modern methods for the enactment of curriculum, indeed, went hand in hand with modernization of the content of the curriculum.

The rapid rise of popular secondary education at the close of the 19th century took the form of the high school. It made urgent answering questions of what should be taught. The Committee of Ten on Secondary School Studies in 1893 was the first major attempt at standardizing high school curriculum in the United States. Was the traditional classical curriculum in private academies, which prepared young people for college, adaptable to high schools that enrolled a broader swath of society? What kinds of curriculum design served the purposes of general education for this relatively heterogeneous population?

Although the Committee of Ten does not appear to have questioned that subjects should be the organizing principle of the high school curriculum—in contrast to practices of contemporaries such as Jane Addams—they saw themselves as a modernizing force. For example, the committee afforded history considerable space in the secondary curriculum while simultaneously tying the subject to the task of citizenship education. An academic subject arrangement, they insisted, was a good education for young people whether they were next headed to college or the workforce. A half century later, however, influential curriculum designer Ralph Tyler vigorously disagreed. He described the committee's recommendations as too narrow for purposes of general education, even charging that the committee had actually designed a program for educating subject specialists.

### Dewey's Design

Three years after the after the committee, Dewey founded what came to be called the Laboratory School at the University of Chicago. He experimented with curriculum for the elementary grades. Like the committee, Dewey was consciously breaking with the old education although his rejection of

it was more sweeping. The remnants of scholasticism evident in the committee's proposals had no place in Dewey's design. Instead, he proposed an alternative relationship between the child and the curriculum. He drew an analogy with an explorer traveling through an uncharted wilderness: The explorer fords rivers, scales mountains, encounters unfamiliar plants and animals, sees how people there live, and so on. Upon return, the explorer constructs a map of the journey. To Dewey, traditional curriculum represented giving children the explorer's map rather than experiencing the journey for themselves. Experiencing the journey, of course, meant that curriculum could not be fully specified in advance of instruction.

In place of a preestablished curriculum, Dewey conceived the school as an embryonic community in which children cooperated in occupations such as weaving, gardening, cooking, and carpentry. This was not some form of technical or vocational training for future jobs, but purposeful activity intended to show how people cooperate in basic social activities, which he saw as a cornerstone of democratic living. It was through children's experience with occupations that subjects such as geography, history, and science entered the curriculum. Thus, for instance, geography emphasized the Earth as the home of human occupations, which led out to the history of how settlers in the English colonies faced the challenges presented by different regional environments and to science with, for instance, its application to chemical processes involved in colonial life such as bleaching and dyeing. Disembodied study of the three R's (reading, writing, arithmetic), Dewey insisted, was an improper organizing principle for elementary curriculum. In Dewey's design, the three R's and other skills would be acquired in context as needed while children worked to solve problems. Thus, Dewey did not abandon the traditional subjects, but the lines between subjects became fluid and subordinate to the demands of inquiry.

### Social Designs

Social designs emphasize that schools are essentially institutions created to serve the interests of society. This view extends back to at least Plato. Social designs overlap with Deweyan designs—he believed education required the stimulation of the

individual in social situations. Subject designs can be oriented, too, in social ways.

Adopting a social perspective does not answer whether the aim is to educate toward the prevailing social order or to reform it or, more commonly, some of both.

The former perspective was influential by the start of the 20th century: Efficiency was prized. Strongly influenced by time and motion studies in industry, scientific curriculum designers applied an industrial design to schools: A systematically designed program, including tracking and testing, would efficiently sort students by aptitude and achievement. For example, pioneer curriculum maker Franklin Bobbitt surveyed the knowledge, skills, and values possessed by successful adults in Los Angeles. He regarded this as discovering the basis for a curriculum through which youngsters would imbibe the knowledge, skills, and attitudes they would later need in their adult walks of life. Bobbitt gave precedence to subjects he believed held direct utility in daily life, such as spelling and arithmetic. He contended that the social utility of subjects such as history, geography, and literature needed more satisfactory demonstration.

Scientific curriculum designers wanted to sort and track students into groups headed for certain kinds of jobs in the adult workforce. Schools should distinguish future workers from future professionals. Dewey saw this as undemocratic and, in any case, believed it was impossible to predict precisely what knowledge and skills would be needed in the future. The only sound way to prepare for the future was living to the fullest in the present, he insisted. The assumptions underlying scientific curriculum making have persisted into the 21st century through such means as national standards and standardized testing.

Advocates of social reconstruction believed schools should participate in building a new social order. Dewey, too, had often described schools as a path to social reform, but the social reconstructionists took it a step farther. Whereas Dewey always championed free inquiry, social reconstructionists flirted with—a few such as George Counts even embraced—curriculum designs that indoctrinated in order to build a more just society.

Although Counts is well remembered for his theory, the social reconstructionist who arguably had most influence on practice is Harold Rugg. He

designed, constructed, and disseminated a series of social studies materials that embodied his educational principles. By chance, the publication of his textbooks coincided with the onset of the Great Depression, which was a time of pointed social criticism. The purpose of these materials was for young people to form a realistic understanding of modern life, particularly problems facing U.S. society. Right-wing critics—mostly from business and self-appointed patriotic groups—labeled Rugg a radical. They roundly attacked his treatment of national problems that they claimed undermined belief in national accomplishments. Rugg's materials, which were bestsellers, were routed from the schools and, in a few communities, burned. Although authoritarian patriotism was not new then and has periodically been behind attacks on progressive curricula since, censorship of the Rugg materials may represent its most striking success.

Social change has never entirely disappeared from the discourse of curriculum studies (e.g., critical theory), however, it is hard to point to comparably widespread effects on curriculum design since Rugg's time. A possible exception is intercultural/intergroup education, more or less the forerunner of multicultural curriculum designs. Though multiculturalism can serve various purposes, it is one of the few tangible influences on curriculum design in recent decades with considerable potential for social change. Nonetheless, as its theorists have recognized, multicultural subject matter can be directed at social adaptation as well as change. It is also unclear whether multicultural designs are best as stand-alone programs or as integrated in the standard school subjects. As far back as the 1940s, intergroup and intercultural education pioneer Hilda Taba recognized that this new material sometimes found readier acceptance when introduced through established school subjects.

### Personal Relevance

Design from the personal relevance perspective can take several directions. One direction that has periodically been popular is open or informal education. Drawing on a tradition of child-centered education stretching back to at least Jean-Jacques Rousseau, open educators look to the root meaning of education as bringing out and developing what is already within the student. This implies a

curriculum design tailored to the individual's aptitudes and interests. By the same token, faith is placed in collateral learning leading in educationally fruitful directions. One of the best-known examples of open education occurred in England in the 1960s and 1970s.

Plowden-oriented primary (i.e., elementary) schools placed a premium on the quality of the child's engagement with subject matter. Although this limited advance planning of the curriculum, at the same time it capitalized on pursuit of individual interests. This scheme of things, as Dewey had noted of child-centered progressive curricula years before, risked undermining sequence in learning, what he called continuity of subject matter. Plowden-oriented educators seemed confident, however, that an educative sequence of learning would emerge from the child's genuine engagement. As with sequence, subject boundaries were subsidiary to connecting ideas, and acceptable modes of expression (e.g., drawings, stories, poems, collages) were relatively unconstrained. As would be expected, the subject matters as well as learning outcomes of Plowden-oriented programs could be diverse.

As with social designs, personal relevance can be construed in contrasting ways. For example, personal relevance can also be construed as programmed learning where, as in open education, there is individualization of the curriculum. But unlike open education, the interests and motivations of the student are not primary in programmed learning. Rather, emphasis is on efficiently directing students to master the same body of subject matter. A main distinguishing feature of the design of one student's curriculum versus another's might be the amount of time needed for program mastery or, perhaps, an individualized arrangement of the material suited to a student's preferred learning style. For all its emphasis on the individual, this standardization of subject matter holds some resemblances to scientific curriculum designers such as Bobbitt as well as to later national curriculum standards.

### Intellectual Development

The intellectual development design focuses on building fundamental understanding of concepts and relationships in the learner. Swiss scholar Jean Piaget is often considered its progenitor. Intellectual

development adherents argue that typical curricula are superficial, resulting in periodic media stories about how some groups of college graduates are unable to explain, for instance, how the earth's movement around the sun is related to the seasons. It is unlikely these graduates failed to encounter relevant information in their studies but they failed to develop understanding of its conceptual basis.

In intellectual development designs, primacy is assigned to reasoning about some question in order to develop a satisfying answer. This process, as Eleanor Duckworth points out, involves trial and error, takes time, and places the question at hand in context—all of which conflicts with efficiency-oriented curriculum designs. Intellectual developmentalists counter that building an explanation is the major and motivating learning task versus merely reciting the outcome of someone else's thinking process.

Perhaps more than most curriculum designs, the almost clinical role for teachers in intellectual process designs as they guide student inquiry creates special pedagogical demands. In particular, teachers must wield a wide knowledge of topics to be taught and at the same time be sensitive to the learning demands of the topic. To Duckworth and others who follow similar lines, this suggests the prevailing separation of subject matter and professional preparation in teacher education programs is a mistake.

### Hidden Designs

Although the hidden curriculum is different in kind from the designs considered thus far, it may be no less educationally significant. All designs contain tacit dimensions as well as what is made explicit; however, the hidden curriculum is by definition unannounced. Thus schoolchildren learn, for example, to respond to bells, obey teachers' instructions, raise their hand to ask a question in the classroom. These behaviors are seldom publicized as educational objectives, but habituation to them makes their effects telling, as Philip Jackson underscored in *Life in Classrooms*.

Much of the hidden curriculum is, at least when pointed out, apparent to all and challenged by few, prompting some observers to refer to it in this sense as implicit rather than hidden as the latter connotes conspiracy. But there can be grim motives for and results of hidden curriculum. It can, for

instance, disadvantage individuals and groups along lines of social class, gender, race, ethnicity, sexual orientation, religion, and nationality. Curriculum materials can be implicitly framed to portray groups or individuals unfavorably or to sanitize controversy. Some of the most ambitious proposals for curriculum reform, such as that by Nel Noddings for a program based on an ethic of care, seem as much a response to the hidden as the explicit curricula of schools.

## CURRICULUM DEVELOPMENT

---

The formalization of curriculum development as a practice in the U.S. public schools can be traced to

the early 20th century and the defining principles embodied in the work of John Franklin Bobbitt. Using a technique known as activity analysis, Bobbitt tried to identify activities in the school that he believed prepared the learner for specific tasks in life—among them vocational, sociocivic, familial, and intellectual tasks. His effort to connect the main activities of life to the actual conduct of the school represented an early systematic approach toward organizing and ultimately exercising some control over what got taught in schools. This desire to find a way to deliberately and consciously direct the conduct of the school became the driving principle behind the rise of the curriculum field and the valorizing of a process that has since become known as curriculum development.

Today the idea of curriculum development is still associated with the design and operation of schools, although disagreements exist over just what comprises the details of the curriculum development process. Many educators still equate curriculum development with subject matter organization, believing that the curriculum is improved by changing or otherwise reorganizing what gets taught. The bias inherent in such a characterization of curriculum development makes a distinction between the term *curriculum* and the term *instruction*, implying at least some analytical separation between what is taught (the curriculum) and how it is taught (instruction). The curriculum development process, however, is organic and comprehensive in its outlook. It makes it clear that any determination about how to teach has to be done in relation to what gets taught and that any determination about what gets taught has to be understood in relation to wider learning purposes and accompanying learning effects.

Fortunately, the curriculum studies field has yielded a historical model of curriculum development that accounts for the comprehensive dimensions of the school experience. General consensus, embodied in the work of, among others, J. Wesley Null, Daniel Tanner and Laurel Tanner, and Peter Hlebowitsh, points to a procedural definition of the curriculum development process that includes the tasks of planning, implementing, and evaluating the school experience. Such a view necessarily accounts for some conceptualization of what gets taught (via subject matter, values, and skills) as it intersects with teacher decisions over how to teach

and how to demonstrate whether learning has actually taken place. Originally articulated by Ralph Tyler, and later by Hilda Taba, such a view of curriculum development can be conceived as a three-part process that includes (1) some statement of purposes (embodied as specific objectives and content organization), (2) some instructional response on how to teach in relation to explicitly articulated purposes, and (3) some program of evaluation of outcomes.

As indicated, this procedural model for curriculum development is historically associated with the work of Tyler, who used four key questions to outline the continuum from purposes to experiences to evaluation:

1. What educational purposes should the school seek to attain?
2. What educational experiences can be provided that are likely to attain these purposes?
3. How can these educational experiences be effectively organized?
4. How can we determine whether these purposes are being attained?

Tyler's questions, often referred to as the Tyler Rationale, set the foundation for the design of the school curriculum, as evidenced by later efforts to expand upon the four questions, notably in the work of Taba, who identified a seven-step curriculum development process that included (1) diagnosis of needs, (2) formulation of objectives, (3) selection of content, (4) organization of content, (5) selections of learning experiences, (6) organization of learning experiences, and (7) determination of way to evaluate. The Tanners assert that Tyler and Taba worked out of a progressive tradition that had its ancestry in John Dewey's phases of reflective inquiry, which helped to frame the idea of curriculum development in relation to a problem-solving process.

The act of curriculum development, however, requires thinking that goes beyond its procedural nature. Obviously, some theoretical direction has to be provided to help educators navigate through the curriculum development process so that when educators are faced with the prospect of, say, converting purposes into classroom experiences they have some theoretical direction for decision

making. To this end, Tyler articulated the need for the curriculum development process to be filtered through three screens, adumbrated as (1) studies of the learner, (2) studies of contemporary life outside of school, and (3) suggestions from subject specialists. According to the D. Tanner and L. Tanner, Tyler's screens are isomorphic with a trinity of factors, again rooted in the work of Dewey, a condition that accounts for the nature of the learner, the values of the society, and some contemplation of worthwhile knowledge or subject matter. These three factors, when taken together, represent a complementary theoretical framework for decision making in the curriculum development process. The framework has the direct effect of forcing educators to weight their decisions in the light of the learners' interests and developmental needs, in the spirit of the ethical foundations of democratic living, and in the context of socially and intellectually worthwhile knowledge. These fundamental factors have been debated by D. Tanner and L. Tanner and Bob Jickling as paradigmatic to the field.

Curriculum development also has a component to it that deals with issues of implementation and deliberation. Good implementation requires the main agents of the curriculum to be in general agreement with the normative tasks at hand and to have the resources, time, and insight to complete their work, while also understanding that their work is rooted in an ongoing evaluative effort to improve the school experience. Joseph Schwab described a process of group deliberation for the design of the curriculum whereby various participants in the operation of the school are involved in ongoing discussion and debate over what needs to be done. He put a premium on the idea of deliberation in order to make the point that the curriculum should not be viewed as a technocratic process that reduces itself to a manual of instructions (often written by agents outside of the school community and the educational situation). The advantages of curriculum development through deliberation are obvious. Where group deliberation prevails, the curriculum is necessarily kept connected to the particularities of the local situation. Group deliberation also pays a democratic dividend and gives the curriculum the benefit of drawing ideas from multiple perspectives of expertise and experience. In addition, the key players in

the curriculum development process, most notably the teachers, take practical possession of the school curriculum because of their part in determining it.

Finally, it should be noted that the term curriculum development is also loaded with political meaning, especially among a growing rank of scholars who have broadened the meaning (and the use) of the term curriculum in a way that leaves it with a weakened connection to schools. William Pinar, for instance, believes that curriculum needs to be understood as symbolic representation, as institutional and discursive practices, structures, images, and experiences. Such a characterization of the curriculum undeniably represents a distancing from the construct of curriculum development. Pinar and others, in fact, have explicitly waged battle against the Tylerian idea of curriculum development, proclaiming it to be no longer relevant to the work of the curriculum scholar. The problem, as they see it, is that the act of curriculum development is tied to an administrative (and patriarchal) impulse to impose unreasonable control and authority on school teachers and school children. Such a criticism has had a considerable following in the curriculum field and has led some scholars to reject the term curriculum development as an oppressive and imperialistic construct.

The normative design and general operation of the school experience cannot be accomplished without engaging in the act of curriculum development. The idea of translating purposes into experiences that yield effects needing to be understood in relation to originally stated purposes is at the heart of curriculum development. The entire process is screened against a theoretical framework that requires all judgments to be made in relation to the nature of the learner, the values of the society, and some judgment of worthwhile subject matter. This is a principled view of curriculum development sanctioned by a long line of work emerging mostly from the progressive educational literature.

## CURRICULUM DEVELOPMENT

---

In 1962, Hilda Taba's synoptic text *Curriculum Development: Theory and Practice* was published. The textbook focuses on building a step-by-step rational model for understanding curriculum development, design, and implementation. Taba asserted that all curricula are composed of a statement of aims and of specific objectives, selection and organization of content, patterns of learning and teaching, and a program for evaluation of the outcomes. The textbook follows this model for curriculum development. It begins with building an understanding of the function of schooling and education in a modern, industrial society by opening with a brief discussion of the crisis in education, citing many of the same complaints that are voiced today, for example, schools are criticized

for softness, anti-intellectualism, progressivism, egalitarianism, lack of emphasis on fundamentals and academic skills, and emphasis on life adjustment and emotional development. Taba then builds a case for a theory of curriculum development examining relevant literature beginning with the belief that choices must be made about the mission of the schools. This argument is done in a foundational section titled the "Current Conceptions of the Function of School." From there, Taba moves to chapters containing an analysis of culture, including the implications of the analyses. She then proceeds to theories about learning, child development, intelligence and mental development, transfer of learning, social and cultural learning, extension of learning, and the nature of knowledge. These chapters, 3 through 12, constitute the first 193 pages of her textbook and examine the then-current research from sociology, anthropology, psychology, social psychology, and educational philosophy to build their case.

Once the scientific foundations are in place—a rational understanding of the components underlying the factors involved in schooling—Taba moves to "Part Two: The Process of Curriculum Planning." The opening chapters of this section relate to the function and determination of objectives across the academic content: knowledge, skills, and affective or attitude domains. The chapters move to diagnosis of achievement, students, and curriculum problems. This diagnosis includes a chapter on diagnostic devices, both formal and informal. Ideas based on action research and qualitative in addition to quantitative measures are inferred in this chapter. Once the diagnosis is complete, then curriculum experiences can be designed.

For Taba, curriculum experiences refer to both the content and the instructional strategies necessary for the mastering of that content. She believed strongly that different content called for specific strategies to yield desired results. The concerns in Chapter 17, "The Selection of Curriculum Experiences," focus on balancing breadth with depth and on creating thematic and conceptual understanding for students. The problem is to find content that is valid by searching for fundamental knowledge. The more fundamental an idea, the greater will be the breadth of its power and applicability. The search for fundamental knowledge allows educators to distill curriculum into concepts

and generalizations. These curricular concepts would then be developed vertically rather than moving laterally from idea to idea and subject to subject in a disconnected manner. Thus, Taba believes that less is more, suggesting that students study a limited number of carefully selected concepts or generalizations that constitute the basic core of a subject and then use these ideas as the criteria for sampling rather than attempting to cover everything known on a topic. Ideally, these concepts or generalizations would have applicability over a range of academic disciplines, bringing integration and unity to the curriculum.

Once the concepts, generalizations, and units of study have been determined, the students' learning experiences or activities would be decided upon by the teacher(s). Taba firmly believed that each learning activity required pedagogy appropriate to the achievement of the generalization that students were supposed to acquire. In almost every case, the pedagogy of choice was active and inductive—concept development and concept attainment are two of the instructional strategies most often associated with this curriculum approach. Thus, the instructional strategies used by the teachers to facilitate the acquisition of the specific content, skills, and attitudes defined by the curriculum are of paramount importance and are not seen as separate from the curriculum. The next chapter addresses evaluation focused on the ability to use the understandings, skills, knowledge, and attitudes in ways consistent with today's construct of authentic assessment tasks—the Taba curriculum is based on depth and understanding to assist students in making sense of and creating meaning for the world around them. Part Two closes with a chapter on developing a teaching–learning unit.

“Part Three: The Design of the Curriculum” and “Part Four: The Strategy of Curriculum Change” cover more specific aspects of curriculum development, including the call for an overall conceptual framework for curriculum development and strategies for curriculum change, including a chapter on working with groups. Thus, this 500-page text attempts to blend theory and practice with an aim toward improving curriculum development and design by providing both the research base and the specific instruction on how to complete the tasks. For those currently concerned with issues such as curriculum alignment,

the content of this text is as relevant today as when it was published.

## CURRICULUM DISCOURSES

---

The contemporary field of curriculum studies draws together scholars who are interested in a wide range of ideas. Throughout the 20th (and now 21st) century, several schools of thought have emerged from the many conversations among curriculum studies scholars. These conversations have come to constitute forms of discourse. The contemporary field of curriculum studies now reflects scholarly discourses on an ever-expanding range of topics.

### Traditionalist Discourse

Traditionalists believe that education should require students to learn about the great ideas and events of the Western, intellectual, social, and political heritage and should focus on the basic skills of reading, writing, and math. These scholars argue that all children should be taught the same content, and learning should be measured by standardized, high-stakes tests. As a result, drills, recitation, and memorization are viewed as central to learning. Under the George W. Bush administration's No Child Left Behind policies, basic skills have become the core of education, and in some schools, the

only curriculum. It remains to be seen whether this emphasis will be altered by future administrations.

### **Sociopolitical Discourse**

One of the most prolific discourses in curriculum studies focuses on the relationship between the curriculum and the sociopolitical context within which education takes place. Many curricularists note the influence of the U.S. market economy on the curriculum. For example, they argue that the curriculum should not just prepare students for their possible occupations or to improve the power of the United States, but rather curriculum should broaden and deepen our democracy and make our society more socially just. These scholars also critique the ways other powerful societal influences such as religion or popular culture effects curriculum.

### **Antiracist Discourse**

Another vigorous discourse focuses on issues of race. These curriculum studies scholars point out that racism in the United States is far from eliminated in spite of the success of the civil rights movement. Although more subtle and difficult to detect, they point out the insidious ways children of color (particularly African Americans) are still victims of racial discrimination in schools. Many of these scholars have studied the way conventional curriculum has failed to address the societal needs or intellectual health of children of color. For example, several have called attention to the ways educators teach language arts to children of color suggesting that a focus on skills, without the proper context, will likely continue the poor showing that these children make on standardized tests. Antiracist discourse notes that correct English is merely a social construction and the dialect of those in power. Curricularists who engage in this discourse suggest that these skills (along with the content found in most schools) would be best taught as codes of power rather than as the correct way to speak or write. Others note how schools often segregate students of color through policies such as tracking and special education.

### **Feminist Discourse**

Feminist scholars call attention to the influence of patriarchy on school curriculum and research in

curriculum studies. For example, several of these scholars have noted the role patriarchy has played in the deskilling of teachers as this occupation became accepted as women's work by society and the destructive ramifications of this development. Other topics of interest have been the absence of addressing issues of gender in the curriculum, the experiences girls (and female teachers) have in schools, the way research methodology has been dominated by a masculine perspective of knowledge generation, the unique ways girls might learn as opposed to boys, and the ways women (or girls) might view morality as opposed to the ways most men (or boys) do.

### **Postmodernism and Pragmatism Discourses**

Many curriculum studies scholars have utilized postmodernism and pragmatism as frameworks for understanding curriculum in the United States. One central thesis of these scholars is a questioning of grand theories such as Marxism that try to explain all of social phenomena. Postmodernism and pragmatism emphasize the social construction of reality including education. It challenges taken-for-granted notions of just about everything including what it means to be human. A primary form of this scholarship is called deconstruction, which is a type of historical inquiry. In every society there are ideas that the vast majority of people merely accept as fact, and postmodern and pragmatist scholars seek to understand the social conditions in which these ideas emerged. Deconstruction challenges the very notion of normalcy. For example, many educators and lay people might view the notion of learning as the memorization of information. The postmodern scholar would trace the origins of this idea and illustrate the contingent historical events that made this idea commonly accepted. Once these contingencies are identified, the implication is that because learning is a socially constructed idea, we (e.g., educators, society at large, lay people) can change it. Postmodernists and pragmatists refuse to take anything for granted as real or true. Much of this work within curriculum studies has helped scholars explore the ways curriculum is used as a form of social control and to question many of the common everyday rituals and expectations associated with the education of children. Although postmodern scholars emphasize critique of social norms,

pragmatists also point out the importance of reconstruction, arguing that redescription of the possible and realistic reforms are also crucial.

There are many other conversations found within the field in addition to the ones discussed above, including queer studies, historical inquiry, and the internationalization of curriculum studies. No doubt that in the future, many more discourses will emerge as we face the challenges of educating children in our complex and fast changing society.

## CURRICULUM EVALUATION

---

Simply put, curriculum evaluation refers to the process of placing value on a curriculum. Evaluation may focus on a curriculum's design, including content and process; its implementation; or outcomes. It may take place on a broad scale, for example, evaluation of the scope and sequence of a state's K–12 curriculum in all subject areas. Or it may be more specific, as in the evaluation of textbooks adopted for a school district's spelling curriculum in Grades 1 through 6, or a teacher's own test of a curriculum's outcomes. Evaluation may be national or local; external, involving outside reviewers or internal; or involving teacher and student judgment. Although curriculum is ordinarily associated with schools, curriculum evaluation occurs within any institution that educates through a formal curriculum, for example, religious organizations, businesses, hospitals, museums, and libraries. Curriculum evaluation is often thought of as summative, but usually involves both formative and summative procedures. It may

be informal, drawing on a variety of teacher-made techniques or a formal process that utilizes standard procedures and instruments.

Curriculum evaluation schemes reflect different philosophical stances regarding education and range from highly rational and objective to interpretive and subjective approaches. In a rational process, curriculum evaluation is tied to objectives. Evaluation determines whether or not objectives and the learning experiences designed to achieve them produce desired changes in student behavior. Interpretive models are intentionally subjective and rely on observing and recording of experience, immersion of the evaluator in a situation, interpretation, and judgment. The goal is to disclose events, their worth, and quality.

### Purposes of Evaluation

Purposes of evaluation vary and range from the teacher's informal assessments of how students are engaging with materials to standardized tests given at the termination of a curriculum to measure and compare student outcomes. The results of evaluation are used in curriculum design, adaptation, revision, and to inform policy. Results inform decisions about goals, content, organization, learning materials and experiences, methods of assessment, and the teacher's role. The teacher's role in curriculum is an important part of evaluation because some designs call for the teacher to be an active agent who makes decisions about goals, content, organization, and the like. Other designs expect the teacher to focus on instruction, taking a more passive role in regard to the actual design. Although teachers usually gather evaluation data in ongoing assessment and revision of curriculum and to improve their own classroom practice, evaluation data that are gathered on a district-, state-, or nationwide basis becomes more public and political in nature as student outcomes are compared and implications are drawn from the results by the press, the public, and politicians. Hence, evaluation also influences local, state, and national education policy. Likewise, it may influence educational policy within institutions that educate. Public education has seen an increasing emphasis on summative curriculum evaluation through standardized testing in order to hold schools accountable and make them responsible for closing the achievement

gap between children from differing social, cultural, and economic circumstances. Curriculum evaluation, then, informs a social and political process that, in turn, influences curriculum design.

In evaluation of a design, congruence between curriculum goals, organization, recommended learning experiences, methods of instruction, teaching materials, and assessments is considered along with significance and appropriateness of content and its suitability for the target audience. Evaluation of implementation focuses on the ease with which teachers use a curriculum, skills necessary for its implementation, appropriateness of methods and materials for users, the correspondence between design and use, and whether variations from the design meet objectives and student–teacher interactions. Evaluation of outcomes focuses on the extent to which students achieve curriculum objectives and may also include attention to objectives students arrive at for themselves through its enactment.

Broad-scale evaluation is important when a ministry of education, state department of education, local school system, or other institution that educates is interested in curriculum revision or improvement, wishes to determine the extent to which education policies are implemented, or formulates new policy. Such evaluation may be focused on a subject while remaining broad in scope, for example, articulation of a nation’s social studies curriculum between elementary, middle, and secondary schools or appropriateness of an international service organization’s literacy curriculum for women in developing countries. It may be directed toward processes, for example, cooperative learning in a state’s K–12 curriculum or a religious organization’s Sunday school curriculum. On a more micro-level, evaluation of a state’s primary school writing curriculum might focus on writing assessments. Or a national bank might narrowly focus on its training scheme for loan consultants through assessing performance of consultants at one branch. Evaluation, then, may be directed toward the planned curriculum, its implementation, its outcomes, or all of these.

### Formative and Summative Evaluation

Formative evaluation includes needs assessment (or diagnostic evaluation). At the design level, it

helps to refine aims in light of actual needs of a target population. It may be built into the design to help teachers tailor implementation to the interests, background knowledge, skills, and values of their students. Formative evaluation also involves ongoing collection of information that allows designers to test the congruence between a curriculum’s assumptions, means, and ends as it is being used. Ideally, it provides designers with an opportunity to see whether what works on paper actually works in practice. Formative evaluation helps designers realign objectives, organization, methods, materials, and assessments. It assists in the implementation process as an indicator of whether the curriculum requires teacher skills that need to be developed, materials that are not readily available, and the like. Teachers find formative evaluation critical in furnishing ongoing evidence of student progress toward planned goals. It also helps teachers determine how to make adjustments in light of emergent goals that are the result of adaptations made during a curriculum’s enactment. However, when designers expect a curriculum to be implemented with fidelity to the design, its eventual success or failure may be viewed as a result of correct or incorrect implementation or unplanned adjustments by the teacher rather than as a need for revision in the design. Hence, evaluation of the implementation process and the problem of implementation are often considered separately from the design and its outcomes. Both needs assessment and ongoing evaluation of the planned curriculum as it is being used allow for adjustments in teaching strategies and materials and even in the aims of a curriculum. Formative evaluation may be informal in nature, for example, teacher observations and notes, or formal, as in analysis of work samples following a rubric or administering a diagnostic test.

Summative evaluation attempts to determine curriculum effectiveness at its endpoint when instruction is complete. It is often thought of as measurement of student attainment of objectives through standardized tests. However, summative evaluation may be focused on the design or implementation of a curriculum as well. And it may be broad in scope with multiple windows on student achievement of knowledge, skills, dispositions, and values that are called for in a curriculum design. For example, teachers may also assess student

portfolios that include written work, descriptions of creative projects, student self-assessment, and the like; involve students in practical performance tasks or projects that allow them to demonstrate their knowledge and skills; or invite critical friends from outside the classroom to participate in the review. Summative evaluation may be informal as well as formal, for example, student self-reporting or a teacher's record of ongoing observations. Results of both formative and summative curriculum evaluation are used as evidence in revision of a curriculum, adaptation of implementation processes, and making judgments about both institutional and teacher effectiveness and student achievement.

### Differences in Perspective on Evaluation

There are sharp differences of opinion about curriculum evaluation that reflect perspectives on curriculum, teaching, and learning and that reflect differences in values, beliefs, and commitments of those who have an interest in the outcomes of a curriculum. Some educators differentiate between curriculum evaluation and assessment, claiming that evaluation implies judgment, whereas assessment is an objective report of achievement. Nevertheless, the terms evaluation and assessment are often used in interchangeable ways. For some, evaluation means collecting and interpreting evidence of student attainment of the objectives set forth by a curriculum and is most efficiently done through standardized tests. Both formative and summative evaluation are then a highly prescriptive, linear process in which behavioral objectives for students, the organization, and the execution and evaluation of a curriculum are all focused on attaining measurable changes in student behavior.

For others, evaluation is a process of putting together a careful, comprehensive, and informing portrayal of the consequences of a curriculum to demonstrate attainment of multiple purposes, including those set by the student in response to the curriculum as it is experienced. As important as how well students are achieving curriculum objectives is whether the goals are worth achieving. Both formative and summative evaluation are then open ended and may include observation and reporting of outside observers and a collection of artifacts such as work samples, anecdotal records

made by the teacher, questionnaires, observations of critical friends from outside the classroom or school context, students' journals and their records of self-evaluation, and objective measurement instruments.

Tests of student achievement may be norm-referenced, comparing student achievement, or criterion-referenced tests that show how students compare to external criteria. Although many who prefer more constructivist approaches to the curriculum tend to favor criterion-referenced testing, the necessity of finding criteria that can be specified in advance can be problematic and consequently may place limits on enactment of a curriculum, as can finding criteria that are appropriate for students of varying backgrounds and cultural perspectives. In the end, criterion-referenced tests are often used in the same way as norm-referenced tests, comparing student achievement of criteria.

Questions of the worthiness of curriculum goals, methods, and materials are usually addressed in a pilot of the curriculum's design and extensive field testing that give designers an opportunity to adjust a curriculum before it is disseminated. Although a curriculum design may include specific content to be taught, some designs focus on process, leaving specific content to the discretion of local schools and teachers. Many curriculum designs are created by experts away from the context in which they will be used and are intended to be implemented with a high degree of fidelity to the curriculum goals, organization, and methods. Other designs are intended as guides for teacher and student adaptation and invention. Still others emerge as a result of teacher and student involvement in an ongoing process of coconstruction of classroom events and activities. Evaluation takes on a different meaning in each of these cases. Failure of the design to produce anticipated outcomes may be seen as a failure in implementation and linked to teacher motivation, skill, materials, and the like. Or when a curriculum design is intended as a guide, evaluation is an ongoing process of engagement and adaptation in response to collection of evidence about student learning. Student achievement is one indicator of the effectiveness of a curriculum, and students themselves are involved in accumulating evidence as to their strengths and areas of needed improvement, appropriateness of objectives, and the like.

Judgments about worthiness of curriculum content (e.g., the subject to be taught) are made separately when a design is process oriented. For example, a curriculum design that focuses on cooperative process in the classroom may be intended for use with any subject matter. Evaluation of the process-oriented curriculum, whether at the design level or at the point of student outcomes, will focus on whether the process is clear, easy to implement, and produces higher student achievement in any content or subject matter. For example, evaluation of a curriculum that focuses on cooperative learning will not be about whether a particular content is worth learning, but whether it is learned more effectively through use of cooperative processes.

### Critics of Standardized Methods of Evaluation

Critics of standardized testing—whether norm or criterion referenced—point to increasing control of the state over the content of the curriculum through legislation of standardized tests in the name of educational equity. Standardized testing does not inform those interested in curriculum outcomes about the conditions and context in which a planned, intended curriculum is enacted. Furthermore, when the curriculum of the schools is driven by evaluation, important student opportunities that are not easily measured by objective tests are in danger of becoming peripheral to the school program, for example, music, aesthetics, creative expression, civic responsibility, and caring for self and others. Thus, curriculum evaluation can be seen as a mechanism of social regulation in which the capacities necessary to engage in participation in and critique of democratic society are denied those at the bottom end of the social scale. They are drilled in a narrow curriculum that prepares them to do well on tests, but does not equip them with the knowledge, skills, and dispositions necessary to live well and to participate in a democratic society. It also serves to fix blame on the curriculum for a larger social failure to deal with economic conditions and social arrangements that trap segments of the society in cycles of failure.

Some critical theorists assert that curriculum design in itself is an oppressive structure that is used to subjugate students and demean teacher competence; hence, evaluation of curriculum is an

instrument of oppression. From this perspective, curriculum evaluation ought to emerge from critical questioning about the realities of the local situation and be specific to those who are creating and using a curriculum that is locally constructed out of the needs and realities of the people.

Curriculum evaluation, whether of design, implementation, or student outcomes, is never a purely objective process in which the suitability and effectiveness of a curriculum are determined. It can become a social, political process in which differences of purpose, beliefs about where the locus of control should be in education, and conceptions of schooling vie for influence.

### Persistent Questions

Purposes and uses of curriculum evaluation beg persistent questions: (a) Does curriculum—hence its evaluation—encompass methods and teaching? (b) To what extent and under what conditions should teacher discretion trump goals and strategies of a curriculum's design and how does that affect design evaluation? (c) To what extent is evaluation of the curriculum an evaluation of the teacher's skill? (d) In what ways do the context and cultural expectations in which a curriculum is introduced influence its success or failure? (e) To what extent does the testing industry influence the primacy of standardized testing in curriculum evaluation?

## CURRICULUM IMPLEMENTATION

---

Curriculum implementation is a many layered concept that originates in a seemingly straightforward problem of how to effect educational change by successfully installing a new curriculum. Typically, much political capital, subject area expertise, and design capabilities are expended in the development of a new curriculum. The resulting curriculum reflects both education traditions and some newly mandated public policy for schools. The implementation question often arrives as an afterthought of the curriculum development process and is framed, in the first instance, as an issue of communication: How are teachers to understand the new curriculum in a manner that is faithful to the intentions of the new curriculum?

Viewed simplistically in these terms, curriculum implementation becomes a matter of effective and efficient communication between the developers and teachers. The communication is one way; ideally, the developers try to convey the intentions of the new curriculum as clearly as possible by providing the necessary inservice education and supporting teaching resources, while the teachers expect detailed practical help and the necessary support materials to ensure successful implementation. Difficulties with communication are to be expected both in terms of inadequate support from the side of the developers and resistance to change, or poor professional development on the part of the teachers, but in principle these can be addressed through improved communication and practice.

This model of curriculum implementation as being essentially a problem of communication between producers and consumers of curriculum held sway in the curriculum field during the 1960s and 1970s. At the time, a flurry of research literature appeared reporting on the successes and failures of implementation efforts. These were followed by other publications—many by the same authors—that applied the findings to give advice on how to improve future educational change efforts. Historically, much of the original impetus for this flurry of research resulted from the 1975 RAND Change Agent Studies that reported the results of efforts to effect educational change

through the ambitious national curriculum projects of the education decade, which had been inaugurated by the Kennedy administration in the early 1960s. Although the volume of curriculum writing that specifically addresses technical concerns with the mechanics of implementation has waned in the past several decades, a plentiful literature remains with respect to the associated topics of effecting institutional change and school improvement and teacher development.

During the 1980s, and influenced at least in part by curriculum reconceptualism, a movement began to rereunderstand curriculum implementation critically and hermeneutically. Building upon Ernest House's 1979 critique of development and diffusion models of curriculum change and Egon Guba and David Clark's call to set aside unified systems views of curriculum and instruction, Ted Aoki called for a rethinking of curriculum implementation as situated praxis. The lived experience of teachers, Aoki has argued, is always an indwelling between the mandated curriculum (curriculum as plan) and the curriculum as lived with actual students, colleagues, and communities.

A hermeneutic interest in understanding curriculum implementation stands in sharp contrast with a technical interest in the management of change. Although curriculum research with a technical interest was concerned with understanding and ultimately controlling the processes of individual and organizational change occasioned by the introduction of a new curriculum, hermeneutics is concerned with understanding the event of change. Understood hermeneutically, implementation is marked by the arrival of a new curriculum that questions previously taken-for-granted assumptions about teaching. And although a new curriculum is not necessarily an unwelcome intrusion for teachers, its implementation is unavoidably an interpretative event. The RAND studies more or less confirmed this phenomenon after surveying 293 local adoptions of national curriculum projects in which they concluded mutual adaptation reflecting the implementation process.

Over the next several decades, the critical and hermeneutic turn has taken curriculum implementation in a variety of practical and intellectually productive directions. Declining to position teachers as agents delivering a curriculum, the teacher as researcher movement, as developed by Lawrence

Stenhouse, took root in the United Kingdom, producing networks of local teacher directed curriculum development projects. Although the movement suffered setbacks with the Margaret Thatcher government's introduction of the national curriculum in the 1980s, it continues to flourish and has become internationalized through associations such as the Collaborative Action Research Network. Vibrant traditions of narrative inquiry, life history, phenomenological description, and autobiography form alternative discourses of teachers' engagements with curriculum, which serve to counter continuing political pressures to hold educators accountable for implementing ever more narrow and prescriptive curriculum.

Understood narrowly, as instrumental action, the trope curriculum implementation can contribute to the oppression of teachers, especially in the present age of accountability and audit culture in public education. An alternative focus, which understands implementation as interpretive action, fits well with a contemporary curriculum scholarship that is concerned with subjectivity and teacher identity. To teach means to be engaged pedagogically in public service, and as such, teachers will always be required to connect with curriculum change. Whether curriculum implementation is conceived as instrumental action or interpretive action is an open question that hinges on how politics and scholarship are taken up in the teaching profession.

## CURRICULUM INQUIRY

---

Drawing from multiple disciplines in diverse fields of studies, curriculum scholars have developed a wide array of forms of inquiry. More forms of curriculum inquiry emerge as curriculum inquirers continue to challenge traditional ways of engaging in and interpreting research and perceive curriculum inquiry as a form of liberatory or radical democratic practice. This liberatory and radical democratic orientation of curriculum inquiry vitalizes heated debates and complicated conversations among curriculum theorists. From these debates and conversations, a contested conception emerges that curriculum inquiry and curriculum studies are synonymous.

In addition to the interdisciplinary, transdisciplinary, and sometimes counterdisciplinary quality of curriculum studies, another aspect of curriculum inquiry is the broad conception of what counts as inquiry. Elliot Eisner states that this increased breadth is not a license for anything goes, but a recognition that the roads to understanding are many and that a narrow view of method is likely to lead to limited understanding of how curriculum works in schools and societies. More and more curriculum inquirers have not only questioned whose knowledge should be considered valid and how experience should be interpreted, theorized, and represented, but also have confronted issues of equity, equality, social justice, and societal change through research and action.

### Traditions of Forms of Curriculum Inquiry

Curriculum inquirers draw on a wide array of research traditions filled with controversies, contradictions, and complexities. As early as 1938, John Dewey developed logic: the theory of inquiry in which matter and form are intertwined in a flux of continuous movement among the past, present, and future situated in contexts. For Dewey, conception without perception is empty and perception without conception is blind. Human importance should

be the primary purpose of inquiry. A separation of matter from form, conception from perception, operations from humans, or inquiry from contexts leads to cultural waste, confusion, and distortion of human condition. Dewey's theory of inquiry is the foundation of forms of curriculum inquiry.

Parallel with Dewey's democratic ideas, the work of W. E. B. Du Bois, Anna Julia Cooper, and Carter G. Woodson also greatly influenced curriculum inquiry with activist orientations that connect the personal with the political, the theoretical with the practical, and research with equity, equality, and social justice. For instance, research on teachers that flourished during the progressive era promoted Dewey's democratic ideal in education and many aspects of life; action research in social sciences originated by John Collier and Kurt Lewin in the 1940s counteracted racial prejudice and promoted more democratic forms of leadership in the workplace.

Prior to the 1970s, Joseph Schwab created three important concepts for curriculum inquiry: the practical, the four commonplaces of curriculum (learners, teachers, subject matter, and milieu), and two forms of inquiries—stable inquiry and fluid inquiry. Ambiguous, incomplete, and fluid aspects of inquiry that focuses on changing real-life situations and contexts rather than on pre-established theories is central to curriculum inquiry. In the 1970s, various forms of curriculum inquiry flourished as the field was reconceptualized. Dwayne Huebner introduced phenomenology to curriculum studies and called for an exploration of experience of curriculum through five value frameworks: the technical, the political, the scientific, the aesthetic, and the ethical. Like Huebner's, James Macdonald's work provoked the Reconceptionalization Era, influencing generations of curriculum scholars. Macdonald perceived education as a societal pivotal point to explore oneself and the broader human condition in a meaningful context.

As early as 1979, drawing upon Dewey's theory of experience, aesthetics, and education, George Willis perceived phenomenological inquiry as a form of interpretative inquiry into human perceptions and the aesthetic quality of human experience. Ted Aoki explored curriculum through phenomenology, poststructuralism, critical theory, and cultural criticism. In the 1980s, David Jardine

further developed phenomenological inquiry as a way not only to help understand the world, but also to change the way we live. Since the 1970s, Max van Manen used a hermeneutic phenomenological inquiry to research lived experience. Phenomenology became central to *currere*—a driving force for emerging forms of curriculum inquiry during the Reconceptionalization Era.

William Pinar and Madeleine Grumet linked phenomenology with autobiography and advanced *currere* as an autobiographical form of inquiry to study one's experience in the past, present, and future and the impact of social milieu on experience. A wide array of curriculum inquirers began to engage in a variety of inquiries to critically examine social and political forces enacted on curriculum. In 1977, Paul Willis established critical ethnography to portray the experience of poor and working-class youth rebelling against school authority who prepared them for working-class jobs. Paulo Freire pioneered a critical participatory inquiry to assist the oppressed Brazilian peasants to liberate themselves by telling their own life stories. Drawing from critical theories of the Frankfurt School spanning from Karl Marx to Jürgen Habermas and Freire, Michael Apple, Henry Giroux, Peter McLaren, Jean Anyon, and many others engaged in critical participatory inquiries to study the life in schools, communities, and societies. Elizabeth Ellsworth countered the repressive myth of critical inquirers and advocated critical feminist inquiry that perceives curriculum, teaching, and learning as contradictory, partial, and irreducible knowledge. Grumet and Janet Miller developed activist feminist inquiry to study the stories and democratic practices of women teachers.

William Watkins, built on the work of Du Bois and James Anderson, advanced Black protest thought, and developed Black orientations to curriculum inquiry that focus on Blacks' experience of inequities, racism, racial subordination, oppression, discrimination, White supremacy, marginal curriculum, and practices of scientific racism. Drawing from post- and neocolonial feminism and Black feminist thought that hold that sexism, class oppression, and racism are inextricably bound in experience, Patricia Collins and Angela Davis utilized the intersection of race, gender, and class as a framework to explore the experience of the Blacks.

Since the 1970s, multicultural theorists such as Geneva Gay, Gloria Ladson-Billings, and Sonia Nieto and critical multicultural theorists such as Christine Sleeter, Peter McLaren, and Cameron McCarthy have influenced curriculum inquiry by bringing issues of race, gender, and class to the center of concerns in inquiry. Kathryn Au, Gay, Ladson-Billings, and Jacquelyn Irvine have developed various inquiries to explore culturally congruent, relevant, and responsive curricula for disenfranchised and underrepresented individuals and groups. Jean Anyon, Lois Weis, Michelle Fine, and Laurie Olsen have brought critical inquiry into classrooms and school-based research.

Since the 1980s, Jim Cummins has brought critical pedagogy into the exploration of experience of language, culture, identity, and power of marginalized and disfranchised individuals and groups. Many researchers, such as Lourdes Diaz Soto, Guadalupe Valdés, Angela Valenzuela, Chris Carger, Grace Feuerverger, Stacey Lee, Kelleen Toohey, JoAnn Phillion, Ming Fang He, and Guofang Li, have been exploring the experience of language, culture, identity, and power—the curricula immigrants and their children live in families, communities, and schools—as a significant form of curriculum inquiry.

Pinar, William Reynolds, Patrick Slattery, and Peter Taubman have developed multiple ways of understanding curriculum. William Schubert has discovered that curriculum inquiry is vitalized between the dynamic interplay among curriculum paradigms, perspectives, and possibilities: inquiry paradigms (empirical–analytic, hermeneutic–practical, critical praxis, postmodern), emergent eclecticism (practical inquiry, curriculum evaluation, existentialist perspectives, hidden curriculum, critical theory, counterculture teachers, teacher action research, reconceptualist theorizing, curriculum history), and contemporary venues of curriculum inquiry (intended curriculum, taught curriculum, experienced curriculum, embodied curriculum, hidden curriculum, tested curriculum, null curriculum, outside curriculum). Drawing from Dewey and Schwab, Michael Connelly and later on joined by He, Phillion, and Candace Schlein contend that the breadth, diversity, and complexity of the field and its practical relevance are central to a wide array of educational thoughts reflected in contested curriculum theories, practices, and contexts.

In 1991, Edmond Short featured diverse forms of curriculum inquiry including conventional disciplinary forms of inquiry such as philosophical, historical, and scientific inquiries; some interdisciplinary forms such as theoretical, normative, critical, and deliberative inquiries; and some qualitative inquiry forms such as ethnographic, aesthetic, narrative, phenomenological, hermeneutic inquiries, and action research. In the same year, Willis and Schubert, drawing from arts and humanities, called for curriculum inquirers to reflect upon their understanding of curriculum, teaching, and learning through the influence of arts in their lives. Although Dewey's theory of inquiry and Schwab's three concepts for curriculum inquiry—the practical, the four commonplaces, and two forms of inquiries (stable and fluid)—are foundations of curriculum inquiry, the conceptual frameworks created by Pinar, Schubert, Connelly, and Short have been most influential for emergent forms of curriculum inquiry in the field.

Since the 1970s, Maxine Greene has been inspiring generations of curriculum inquirers to connect arts, passion of pluralism, and narrative imagination with inquiry to provoke political awakening, cultural empathy, social activism, and social justice to build a participatory community to create hopes, dreams, and possibilities for forgotten and disfranchised individuals and groups. Since the 1970s, drawing from the works of Dewey on art, experience, and education, Eisner has brought the significance of arts, aesthetic knowing, and imagination to curriculum, teaching, and learning and perceived artistic-aesthetic dimension of experience as an enlightened eye of curriculum inquiries. In the 1980s, Eisner and Tom Barone formulated arts-based educational research as a form of curriculum inquiry that expands an unfolding orientation to curriculum inquiry that draws inspiration, concepts, processes, and representational forms from the arts as Gary Knowles and Ardra Cole advocate in their work.

Self-study in the teacher research movement parallels the development in life history research of Cole and Knowles and teacher lore research of Schubert and William Ayers in which the teacher is perceived as researcher engaged in deeply reflective practice to change the curriculum and the world, as also shown in the work of Donald Schön. Researchers engaged in participatory inquiry,

originating in Latin America, Africa, and Asia and closely associated with adult education and literacy movements represented by Freire, Donaldo Marcedo, and Budd Hall, work with oppressed groups and individuals to empower them so that they take effective actions toward more just and humane conditions.

### A Turn to Narrative and Contested Forms of Curriculum Inquiries

In response to the contradictions, diversities, and complexities of human experience, as Robert Coles called for in 1989, curriculum inquirers incorporate narrative, story, autobiography, memoir, fiction, oral history, documentary film, painting, and poetry into inquiries. Narrative inquiry, pioneered by Connelly and Jean Clandinin, flourishes in the research on curriculum, teaching, and learning. Narrative work can also be found in life-based literary narratives drawing upon the notion of narrative or literary imagination in the works of Greene and Martha Nussbaum. Narrative is also becoming prevalent as researchers such as Ladson-Billings, Laurence Parker, Donna Deyhle, Sofia Villenas, Sandy Grande, and David Stovall draw on critical race theory to tell hidden and silenced narratives of suppressed and underrepresented groups to counter the preconceived metanarrative represented in scientific-based research that often portrays these groups as deficient and inferior.

In addition to a turn to narrative in the field, there are emergent contested forms of curriculum inquiry that move beyond boundaries, transgress orthodoxies, and promote cultural, linguistic, intellectual, and ecological diversity, justice, and complexity. For instance, James Sears and Pinar developed queer theory in curriculum studies built upon gender studies emerged from the fields of gay and lesbian studies and feminist studies heavily influenced by Michel Foucault and Judith Butler. Through a reflexive and reflective inquiry into one's personal experience, queer inquirers deconstruct categorizations and fixed notions of gender, sexuality, and identities. This fluid aspect of identity and sexuality connects with the work of George Lakoff and Mark Johnson on body and mind connection, Martha Nussbaum on literary imagination and love's knowledge, and Ruth Behar on vulnerable observer. This complex and fluid quality of

experience influences generations of qualitative researchers in cultural studies such as Marla Morris in psychoanalysis, Patti Lather in postmodern feminist research, Pauline Sameshima in pedagogy of parallax, John Weaver in postmodern science and narrative, Greg Dimitriadis in performing identity-performing culture, and Hongyu Wong in the third space to honor the fluidity and complexity of bodily knowledge in curriculum studies.

More researchers draw upon the work of Du Bois, Edward Saïd, Freire, Ayers, and many other critical, liberatory, and democratic thinkers and engage in activist and social justice oriented research in curriculum studies. There is a burst of oral history research in curriculum studies drawing upon frontier women's oral history research in 1975 led by academic feminists and feminist activists such as Sherna Gluck, Margaret Strobel, Sherry Thomas, Susan Armitage, Judy Yung, Daphne Patai, and many others documenting the lives and experiences of women collected from health clinics, rape crisis lines, battered women shelters, displaced homemakers programs, women's legal services, welfare rights organizations, and women labor organizations. The oral history research also draws from oral narrative research engaged by Africana (African and African American) women scholars such as Georgia W. Brown, Kim Marie Vaz, Renée T. White, and many others. More curriculum inquirers, particularly a large group of practitioner inquirers in the South and Midwest, led by He and Phillion, engage in personal-passionate-participatory inquiry that employs critical race oral history, critical race geographical narrative, documentary research, or oral narrative research method to explore the narratives and experiences of repressions, suppressions, subjugations, and stereotypes of Southern women, Blacks, and other disenfranchised individuals and groups, and the force of slavery, racism, sexism, classism, religious repression, and other forms of oppression and suppressions on the curriculum in the South.

There are emergent critical and indigenous methodologies, led by Linda Tuhiwai Smith, Sandy Grande, Teresa McCarty, and Tsianina Lomawaima, that connect critical theory with indigenous knowledge and sociopolitical contexts of indigenous education to develop transcendent theories of decolonization and advocate the liberty of indigenous language and cultural rights and

intellectualism. There is also an emergent form of post- and neocolonial feminist inquiry, led by Trinh T. Minh-ha, Chandra Talpade Mohanty, Uma Narayan, Kwok Pui-lan, Gloria Anzaldúa, and Chela Sandoval, that explores repatriarchal historical analysis, spirituality, migration, displacement, slavery, racism, sexism, classism, imperialism, colonialism, heterosexism, ageism, ableism, anthropocentrism (i.e., human supremacism), speciesism, and other forms of oppression.

## CURRICULUM INQUIRY

---

*Curriculum Inquiry*, housed at the Ontario Institute for Studies in Education in Toronto, Ontario, Canada, is one of few academic journals dedicated specifically to issues in curriculum studies.

*Curriculum Inquiry* grew out of the *Curriculum Theory Network (CTN)*, founded in 1968 by 12 professors of education. *CTN* started out as a newsletter in which professors of curriculum exchanged ideas with each other and their graduate

students. Their goal was to encourage professors to take risks and to contribute original ideas even if unorthodox or unfinished. Eventually, the newsletter turned into an occasional publication and then a quarterly publication in 1974. *CTN* became *Curriculum Inquiry* in 1976 and extended its intellectual purview to include philosophy, history, literary criticism, and almost any style of inquiry that explored problems concerning curriculum theory, development, and evaluation. At this time too the journal switched from an in-house publication to John Wiley and Sons.

The spirit of *CTN* continued in *Curriculum Inquiry*, and the major issues of the day confronting curriculum studies could be found by reading the four editions that came out yearly. A “Dialogue” section in most editions devoted to specific topics allowed for discussion and debate as did the “Editorial Essays.” Readers of the journal are likely to have their own favorite dialogues and essays, and though it is impossible to list all of them, a few ought to be mentioned to provide a sense of the kinds of topics that arose.

Particularly memorable was a 1984 editorial by Roger Simon, “An Open Letter to Michael Connelly on the Occasion of Reading his Editorial: ‘The Henry Giroux Episode,’” on Henry Giroux’s denial of tenure at Boston University and the responses the editorial ensued, one of which was by Giroux himself. At the heart of this discussion were issues concerning academic freedom, communication, and power.

In 1989, there was a spirited reaction by D. C. Phillips and Elliot Eisner from different perspectives to A. Alexander’s essay about relativism, absolutism, and curriculum. Epistemology is at the center of this dialogue. What counts as knowledge? Eisner and others would raise epistemological issues in regard to objectivity and subjectivity in research in several 1992 editions and again in 1994.

Peter Hlebowitsh’s Spring 2005 essay, “Generational Ideas in Curriculum: A Historical Triangulation,” in which he argued that Joseph Schwab is more aligned with Franklin Bobbitt and Ralph Tyler than some scholars have suggested raised provocative reactions to his thesis. At stake in this issue is an understanding of the curriculum studies historical trajectory.

There were of course countless other groundbreaking articles and discussions that marked the

journal's pages. Today, the journal is published by the British-based Blackwell. In 2008, the journal expanded to five issues per year to have one edition dedicated to book reviews. There have been a number of associate editors, series editors, and book review editors over the years, but it is Michael Connelly's vision that steered the journal. Connelly was the coeditor in 1980 with Roger Simon and became the sole editor from Winter 1982 to Spring 2005. Other editors have included Leonard Berk, Joel Weiss, Roger Simon, Ming Fang He, JoAnn Phillion, and Dennis Thiessen.

## CURRICULUM INQUIRY AND RELATED SCHOLARSHIP (WEB SITE)

---

Curriculum Inquiry and Related Scholarship is an academic bibliography Web site with over 3,000 annotated citations organized and compiled by Edmund Short. Curriculum inquiry was conceived by Short as a congregation of intellectual approaches to variously understand, interpret, and create knowledge. These approaches differ in their intellectual origins, the kinds of curriculum questions asked, their immediate practicality, and their apparent compatibility to other methods of inquiry. In his edited volume, *Forms of Curriculum Inquiry*, published in 1991, Short identified 17 research approaches to curricular considerations, arguing for scholarly acceptance of alternative modes of inquiry beyond those that were conventionally practiced in curriculum development.

Making the case that the complex practical, relational, and holistic nature of curriculum study

invites multi- and transdisciplinary scholarship, Short contended various inquiry forms are needed to answer different questions. Thus, a form of inquiry should not be judged by its immediate practicality or its relationship with conventional forms used in the social sciences, but rather by its reliability as demonstrated by the expert skill of the researcher in use of techniques in the method, transparency of the inquiry process for review and criticism, and the strength of the research as an argued response to the stated questions.

From Short's lifelong research in the area of curriculum inquiry, he proceeded to compile a massive bibliography with seven components. These fields include the full citation, an annotation of content, a descriptor of topical focus of the study (for which there are 23 terms), a designated research field from which the research is drawn, mode of inquiry (for which there are 22 different modes), the type of study (including single study, collection of studies, status study, research synthesis, survey, case study, bibliographic compilation), and content descriptions (for which there are 108 descriptors). The bibliography selections draw from studies that were first conducted during the 1960s; the Web site is constantly updated.

## CURRICULUM KNOWLEDGE

---

Curriculum knowledge can be taken to mean a number of things: the subject matter that falls within the curriculum of a school or college, the

substantive learning acquired by students upon engaging in a program of study, and the expertise possessed by professionals who specialize in designing, maintaining, or changing curricular programs in educational settings. In this encyclopedia entry, curriculum knowledge refers to none of these meanings, but rather to the kind of knowledge that results from deliberate inquiry into curriculum research questions. It is the product of attempting to gain understanding of quandaries related to curriculum through formal, acceptable knowledge-producing inquiry processes. This kind of inquiry seeks curriculum knowledge on virtually anything that might be relevant to thinking about or making practical decisions on curriculum matters. Curriculum knowledge construed in this fashion intends to be useful in informing curriculum practice.

The practice of curriculum, therefore, becomes the starting point for creating curriculum knowledge and is ultimately the setting in which curriculum knowledge is utilized. What counts as curriculum practice? Curriculum practice refers to all those practical activities necessary to conceiving, justifying, explicating, enacting, and evaluating educational programs. These activities entail making a myriad of practical decisions, ideally coherent across these various processes, to actualize an educational program over a particular span of time in a particular institutional setting for a certain set of students. The practice of curriculum is not an easy undertaking and requires more than guess work, good hunches, trial and error, and merely prudential considerations; it requires knowledge of circumstances, alternatives, effects, and specialized knowledge pertaining to curriculum practice itself—knowledge that can inform these decisions. Consequently, trustworthy curriculum knowledge must be sought by methods of sound curriculum inquiry.

Curriculum practice is a shared responsibility—one that involves many different people: visionaries and policy makers; experts in academic, technical, and practical fields of knowledge; school officials and funders; teachers; pupils; and curriculum-practice professionals, coordinators, and process managers. The need for curriculum knowledge varies considerably depending upon which of these persons is doing what part of the necessary curriculum practice activities.

The burden on those who do curriculum inquiry is great. If they are to undertake to provide the curriculum knowledge needed by all these participants in curriculum practice so that they can make the best decisions possible for their particular settings and circumstances, they need to know what curriculum questions to attempt to answer. If these researchers are located outside the realm of curriculum practice, they must immerse themselves as fully as possible in the practice of curriculum in order to be able to identify the curriculum research questions that need to be examined. Or they must constantly ask participants what questions their activities raise on which they would welcome research to be done. Alternatively, in lieu of relying upon professional researchers to conduct all needed inquiry, local participants can conduct their own inquiries on their own curriculum questions in their own settings. This is becoming quite common and is often referred to as collaborative action research. This method has the advantage of knowing that the results are pertinent for the decision setting where the research is to be used. Findings produced by outside researchers sometimes do not address local needs because of their broader, more general focus and thus require scrutiny for relevance to local needs and circumstances. Still, there is a role for professional researchers to identify and pursue curriculum research questions that potentially could have value for curriculum practitioners in a number of different settings.

The body of curriculum knowledge produced in the past may not include a great deal that is still useful to contemporary users. Circumstances change. Choices curriculum practitioners must make about purposes, content, structure, teaching, and evaluating the curriculum also change. Many generalizations or even specific findings from past research simply no longer apply. New research is needed. Identification of current curriculum questions that need to be researched is a continuing challenge. Convenient electronic communication of such questions to those doing curriculum inquiry is possible, but not yet institutionalized. Reporting the results of curriculum inquiries to potential users via print and online journals is now commonplace, but searching for needed curriculum knowledge within them is still difficult and more adequate search methods need to be devised. When curriculum practitioners cannot find relevant

research to inform their curriculum decisions, they must do their own inquiries or make judgments in the absence of curriculum knowledge. A very wide range of inquiry modes may be employed in creating curriculum knowledge. Scientific, descriptive, narrative, and evaluative modes of inquiry can answer certain limited curriculum questions with precision, empirical validity, and referential adequacy. Historical and philosophical inquiry can provide very valuable perspectives on current curriculum decisions. Political, sociological, anthropological, psychological, and critical inquiry can establish factual circumstances related to a number of dilemmas faced in curriculum decision making. Doing syntheses of research on particular curriculum research questions is also an invaluable form of inquiry. Deliberative action inquiry remains the most accessible form of curriculum inquiry for curriculum practitioners and can be done in almost any setting. Theoretical inquiry creates curriculum knowledge that defines the nature and conceptual structure of curriculum and curriculum practice, which in turn is used by all others who engage in curriculum inquiry and in curriculum practice. Curriculum inquiry takes many forms—disciplinary, interdisciplinary, and transdisciplinary—and through it, curriculum knowledge is derived.

## CURRICULUM LEADERSHIP

---

There is a wide range of possible definitions of curriculum leadership given the fact that there are

over 100 interpretations of curriculum in the curriculum studies literature and over 200 interpretations of leadership in the leadership studies literature. However, despite this potential proliferation of meaning, there are very few specific definitions of curriculum leadership in the current literature; and with a couple of exceptions, these definitions do not reflect a disciplined understanding of contemporary curriculum studies. For purposes of this entry, curriculum leadership is defined as practical explanation, justification, guidance, and demonstration of a disciplined theoretical position on innovative curriculum work. This definition is appropriate for this encyclopedia for two reasons. Over the past 40 years, a strong majority of scholars in the curriculum studies field have championed educational innovation over business as usual, and they have done so in highly diverse ways. At its inception, this avant-garde trajectory was characterized as the reconceptualization of the curriculum field. Because this encyclopedia is an artifact of this reconceptualist heritage, a definition of curriculum leadership focusing on innovative work is appropriate. In April 2006, at the business meeting for the American Association for the Advancement of Curriculum Studies (AAACS), William Pinar argued that it was time for curriculum scholars to begin to think carefully about the disciplinary nature of their field. His argument was accepted by the AAACS membership and served as a key starting point for that organization's ongoing curriculum studies canon project. It is, therefore, also fitting to provide a definition of curriculum leadership, stressing disciplined theoretical work.

This entry elaborates on key distinctions of the definition of curriculum leadership provided here. Next, the entry discusses the Curriculum and Pedagogy Group, whose mission is to advance such a definition of curriculum leadership. Finally, this entry examines the role of curriculum leadership for education of quality.

### Key Distinctions

The definition of curriculum leadership provided in this entry is based on three key distinctions: (1) the difference between curriculum leadership and curriculum management, (2) the difference between curriculum leadership and instructional leadership, and (3) the difference between disciplined and

undisciplined curriculum studies. Many educational scholars distinguish management from leadership with the focus of the former on efficiently maintaining a current system and of the latter on influencing others to engage in innovative change. In general, a management orientation relies on positional authority, whereas a leadership orientation is based on moral authority. Because those in positions of power may not be recognized as moral or ethical, it should not be surprising that leadership is a distributed phenomenon. As applied to education, this would mean that curriculum leadership is a collaborative undertaking involving administrative leaders, teacher leaders, student leaders, parent leaders, community leaders, and other potential leaders who have a stake in curriculum decisions. It would not be unusual for a group of teachers and their students to initiate a particular curriculum leadership project and then attempt to influence and inspire other curriculum stakeholders, particularly administrators and parents. In such a case, the teachers and their students would serve as the initiating educational leaders.

The management–leadership distinction raises an important critical question with reference to a wide range of curriculum study projects. Do these projects advance curriculum management or curriculum leadership? In effect, do they serve business efficiency or do they encourage educational innovation? For example, one of the most visible projects in the history of curriculum studies has been Ralph Tyler’s 1949 rationale for curriculum development. Prior to the late 1960s and the reconceptualization of the curriculum studies field, there was a great deal of literature applauding Tyler’s rationale as an important leadership strategy. Most scholars working out of the reconceptualist heritage criticize the Tyler Rationale as a top-down management strategy; however, there are contemporary curriculum scholars who still defend Tyler’s curriculum development approach as pragmatic leadership. The Tyler Rationale debate raises three questions. To what degree do positions on such topics as curriculum development, curriculum evaluation, and curriculum implementation advance curriculum management, not curriculum leadership, and how is this distinction understood? If the topic of this entry were curriculum management, would there be more educational projects to discuss and analyze?

The distinction between curriculum and instructional leadership is straightforward. Instructional leadership focuses on advancing innovative teaching practices. The best-practice literature in education is quite voluminous because it includes the well-researched and well-articulated instructional positions of all of the major subject matter professional associations such as the National Council of Teachers of Mathematics (NCTM), National Council of Teachers of English (NCTE), National Council for Social Studies (NCSS), and National Science Foundation (NSF). Curriculum leadership focuses on advancing innovative curriculum work that situates instruction in a larger ecological framework that includes such matters as conceptualizing educational philosophy, policy, standards, and goals; designing programs; planning and coordinating instruction; engaging in comprehensive evaluation; and organizing the work culture.

The instructional–curriculum leadership distinction raises important critical questions with reference to the advocacies in the subject matter professional associations. To what degree do their officially sponsored research projects and resulting policies advance curriculum leadership? Do these associations understand the complex, interrelated nature of the fundamentals of curriculum practice? Do they understand that teaching is only one fundamental of curriculum work? For example, are the constructivist best-practice policies of NCTM, NCTE, NCSS, NSF, and other professional associations appropriately ecological? When these professional associations provide guidance to educators on how to teach for subject matter understanding, do they consider the systemic reform implications of their constructivist advice? Do they encourage deliberations that incorporate all of the commonplaces of curriculum work? Have they studied the work of such curriculum scholars as Joseph Schwab, and as a result, are they engaging in the broadly based decision making that curriculum leadership requires?

These critical questions are informed by an understanding of the difference between disciplined and undisciplined curriculum studies. As mentioned earlier, Pinar has recently advanced this distinction. He argues that curriculum studies are disciplined in two important ways, and these two forms of discipline can be conceptualized

along horizontal and vertical axes. The horizontal axis refers to the current contexts of curriculum work. Curriculum scholars display a horizontal discipline in their studies when they address a wide range of educational subtexts: political, cultural, psychological, ethical, aesthetic, spiritual, and so on. This multitextual approach is attuned to the complexities of current curriculum problems. Pinar notes that a presentation on the current state of the curriculum field would be an illustration of the horizontal discipline. The vertical axis refers to the intellectual history of curriculum studies. Curriculum scholars display a vertical discipline in their studies when they draw upon historically significant concepts within their field. Their studies incorporate such topics as the hidden curriculum as well as many other leading ideas in curriculum studies. Pinar notes that an argument for curriculum theorizing that is grounded in key curriculum concepts would be an illustration of the vertical discipline.

The disciplined–undisciplined study distinction raises several important critical questions with reference to any particular theoretical position on innovative curriculum work. Is the innovative idea properly situated in current educational circumstances? In effect, has the curriculum scholar(s) carefully considered the relationship between theory and practice? The theory–practice distinction has bedeviled curriculum studies throughout its history, particularly since the reconceptualization of the field. In 1969, Schwab, who is one of the curriculum field’s leading theorists, complained about the “flight” to theory in curriculum studies. A horizontally disciplined curriculum study project would thoughtfully link theory and practice. Formally speaking, the theory–practice binary would be deconstructed, and the project would not be perceived as academic speculation, disconnected from the real world of education. Specific guidance for the enactment of the theoretical position would be provided or at least suggested.

The vertical discipline in curriculum studies raises other critical questions. Is the theoretical project thoughtfully informed by the history of curriculum studies, or does it attempt to advance a short-term fad? Faddism is a persistent problem in education and has been thoughtfully discussed and documented by a host of curriculum scholars. Experienced teachers are quite aware of this

problem, and they know that if they do not like a particular curriculum innovation, they can usually wait it out. They understand that, generally speaking, their profession is mired in a shallow presentism—a preoccupation with one superficial theoretical idea after another. A vertically disciplined curriculum study project would advance only innovations that have enduring value. Formally speaking, past–present, past–future, and present–future binaries would be deconstructed. In effect, the particular innovation would be grounded in a curriculum wisdom orientation. Specific guidance for the enactment of a holistic practical artistry directed toward enduring personal and social goods would be provided or at least suggested.

### Curriculum and Pedagogy Group

The Curriculum and Pedagogy (C&P) group, which holds an annual Curriculum and Pedagogy Conference, sponsors a peer-reviewed publication titled *Journal of Curriculum and Pedagogy (JCP)*. The first issue of this biannual journal was published in summer 2004. The C&P’s mission statement is a more developed articulation of this entry’s definition of curriculum leadership. Patrick Slattery and James Henderson, who are the coeditors of *JCP*, have analyzed the key parameters of the C&P’s mission statement in their editors’ introductions for each *JCP* issue, and their examination has identified a five-part agenda. First, the C&P community building must be grounded in the horizontal and vertical dimensions of curriculum studies. Without this grounding, specific C&P efforts will not be properly disciplined; they would lack practical breadth and historical depth. Second, particular theoretical positions should address the vital relationship between educational experience and deep democracy. Addressing this relationship would ensure that the curriculum theorizing would be oriented to enduring values, not superficial fads. Third, the theorizing should be informed by diversified inquiries inspired by a particular arc in John Dewey’s philosophical scholarship. Early in his career, Dewey articulated his pedagogical beliefs and demonstrated how these beliefs could be practiced in a lab school work environment and other educational contexts; then throughout the rest of his career, Dewey proceeded to undertake a

diverse set of studies (epistemological, ethical, aesthetic, psychological, sociological, political, etc.) into educational experience with reference to the dynamic relationship between learning through experience and building a democratic culture. Near the end of his long and productive career, Dewey considered substituting culture for experience as the key organizer for his work.

Fourth, the C&P community's curriculum leadership agenda should address the challenges of practicing deliberative judgment. Otherwise, there is the possibility that a particular theoretical position would not promote well-informed decision making, which would then be inconsistent with the C&P's mission to link contemporary curriculum studies with pedagogical artistry. Finally, the C&P should be concerned with inspiring the public imagination. Inspiring the public imagination is quite important because educational practices are currently dominated by standardized management policies. As a consequence of this historical condition, the vast majority of the current public equates quality education with standardized test scores. In terms of public educational policy, this uninformed public makes no distinction between a limited form of assessment and the complexities of curriculum evaluation. Specific individuals may not practice such superficial judgments in their personal lives, particularly when it comes to the education of their own school-age children, but they readily embrace testing accountability as the solution to educational problems.

### **Curriculum Leadership for Education of Quality**

This entry concludes with a concise reiteration of what constitutes good curriculum leadership in societies with democratic ideals. Specific projects that are self-identified as curriculum leadership would take an ecological approach to educational innovation, would be guided by a critical and historical analysis of contemporary society, would be informed by the history of curriculum studies, and would encourage deliberative judgments that advance the enduring values of democratic living. There are few such projects in current education, but many hope this will change in the future. There could come a day when an analysis of curriculum leadership would incorporate a wide range of

current illustrations of disciplined curriculum theorizing that is well grounded in practical explanation, justification, guidance, and demonstration.

This entry's definition of curriculum leadership raises a number of key critical questions that could be asked about any educational project. Because education has historically been coded as a low-status female occupation, does the particular project challenge this sexist heritage? For example, does the project challenge the prevailing assumption that education is not an autonomous profession but a semiprofessional craft in which all teachers need to be carefully managed? Does the project encourage and support a democratically distributed approach to educational leadership? In particular, does the project promote the emergence of and authentic collaborations between administrative and teacher leaders? Does the project encourage and sustain well-informed, moral judgments? Are the educators being challenged to deliberate and reflect on real learning problems with appropriate breadth and depth? If so, is their moral orientation consistent with a democratic social contract? Do they understand that their professional responsibilities extend beyond subject matter instruction? Do they understand that they occupy a vital public intellectual role in their society? Are the educators working out of a comprehensive, ecological approach to curriculum work? Do they understand the systemic nature of their innovative efforts?

There is no particular ideological agenda attached to these critical inquiries. However, there is a deep commitment to treating curriculum leadership as the vital component of quality education, and there is a deep commitment to advancing education as the vital profession in societies with a democratic social contract and mission. This entry's definition of curriculum leadership might not yet be understandable and relevant in societies lacking a curriculum studies heritage, but this historical circumstance is changing as the curriculum field undergoes a fairly rapid internationalization. An increasing number of societies around the planet can now draw upon the local expertise of disciplined curriculum theorists who advance clearly explained, well-justified, practical applications of their innovative theoretical ideas.

## CURRICULUM POLICY

---

There are three kinds of curriculum policy: *formal*, *implicit*, and *prudential*. Formal curriculum policy is the official, mandatory statement of what is to be taught to students. Such statements are expressed in widely different ways by those responsible for policy development, for example, philosophical vision, goals, subject matter knowledge, student standards, and what students know and should be able to do. Curriculum policy takes on broader implicit and prudential meaning during implementation. Implicit curriculum policy refers to policies at various administrative and government levels that influence curriculum practices. For instance, the United States, No Child

Left Behind Act (NCLB) is an education policy with significant impact on local curriculum practices, though NCLB is not a formal curriculum policy. Implicit curriculum policy also refers to statements, documents, suggestions, advice, and other matters that often accompany formal curriculum policy and that do not, officially, carry the weight of mandatory requirement, but that are treated as such in practice. Prudential curriculum policy refers to the prudence, practical wisdom, and practical knowledge used by teachers, school administrators, school board staff, and elected trustees as they adapt formal and implicit curriculum policy for local situations. In many jurisdictions, formal and implicit curriculum policy is established by provincial/state governments. School boards and schools implement these policies in various ways depending on their communities and the variation among communities within the jurisdiction of the school board.

These three kinds of curriculum policies interact in different ways under different forms of government. In the U.S. presidential republican system with a strong central government educational policy role, at least in recent years, implicit curriculum policy may drive state and local formal curriculum policy and may override prudential policy. This possibility is evident with NCLB. In parliamentary systems such as in Canada and in Australia, education is the constitutional responsibility of the provinces and states. The result is that implicit curriculum policy may be formulated closer to school curriculum practice and in closer conjunction with formal curriculum policy than is the case in a presidential system. Ministers of Education in Canada regularly bring curriculum policy to a cabinet of other ministers, some of whom may administer policies impinging on curriculum and that, therefore, function as implicit curriculum policies. There are Canadian examples of financial leverage to implement implicit and formal curriculum policy. For example, in Ontario, schools not achieving provincial content standards receive additional support. In centralized, nonelected governments, for example, China, less is known about the mix of policy forms. Implicit and prudential curriculum policy is likely of less importance in nonelected systems with the result that there is a more direct connection between formal policy and practice than is the case in elected government systems.

### Names for Formal Curriculum Policy

Formal curriculum policy appears in documents with a variety of names, the most common being curriculum guide or curriculum guideline. A similar term, *curriculum syllabus*, is used in Australia. Syllabus also has a more restricted meaning of course outline. In Ontario, the term *curriculum documents* is used to define what students are expected to know. Other common names given to curriculum policy are curriculum goals, curriculum vision, curriculum philosophy, and content and performance standards.

The name given to formal curriculum policy documents, and the language in which they are cast, tends to reflect a mix of currently popular professional educational language and the language of popular discourse. For example in recent years the language of standards, with associated terms such as *benchmark* and *rubric* and the phrase “what students should know and be able to do,” is popular both professionally and publicly and may appear as the name of curriculum policy documents or as an important organizing term for policy documents called by another name. In the examples discussed below, the state of Missouri refers to its curriculum policy as Show-Me Standards, and the province of Ontario refers to its curriculum policy as curriculum documents.

### Practical and Political Functions

Curriculum policy has two principal functions: to guide practice and to establish a position on competing political positions, often by reflecting a government view. The definition of curriculum policy and the discussion of the three kinds of curriculum policy above refer to the practical function. Most, if not all, formal and implicit curriculum policies appear in the practical guideline form. They are designed to be read as directions for the content and outcome of school curriculum. Everything in a formal curriculum policy document refers directly or indirectly to student outcomes of schooling.

The process of writing curriculum policy is political. Curriculum policies are the outcome of competing discourse by a variety of stakeholders. Within the critical curriculum theory literature, the question of “What knowledge should be in the curriculum?” has become “Whose knowledge should be in the curriculum?” The shift reflects the political

function of curriculum policy that, these theorists argue, normally serves the interests of social elites over the socially disenfranchised. Curriculum policies represent concrete political positions and answers on the knowledge question.

The curriculum policy development process may, in some circumstances and situations, not appear to be political. Suppose an elementary school mathematics policy has been in existence for several years and suppose, furthermore, that there is no public or mathematics professional association debate over elementary school mathematics. Periodic updates and revisions to the policy may happen quietly and by the action of a small number of appointed curriculum policy writers, including teachers. The process appears to be academic and bureaucratic. But consider the professional mathematics wars over the kind and purpose of school mathematics and the public debate that periodically surfaces over mathematics literacy and achievement. The appearance of an apolitical elementary school mathematics curriculum is a function of a relatively quiet period in political debate over the mathematics curriculum.

Some curriculum policy development processes originate in public debate, sometimes by coalitions of parents or by advocates for a specific issue, for example, the environment, rather than with the cyclic need to update curriculum policy. For instance, public debate over literacy and numeracy—generated, perhaps, by international comparative achievement studies, widely discussed statements by public intellectuals, or rising international tension and competition—may show up as planks in political party platforms at election time. The political promise to revise or to create new curriculum policy may be an important factor in the election of a particular government. When elected, the Education Department or Ministry oversees the follow-up curriculum policy development process. Policy revised and created in this way is political in character and functions to justify voter trust in the political party. From this perspective, curriculum policy is political not only in the sense of being a practical resolution to public debate, but also in the party sense, meaning that curriculum policy is a two-sided entity that functions both to guide practical curriculum activity and to temporarily resolve political debate. Curriculum policy is best thought of as a fulcrum

balancing the practical guideline function with the political resolution of issues function.

### Curriculum Policy for Curriculum Policy

Curriculum policy statements exhibit variation from political jurisdiction to political jurisdiction. They not only vary in the name given to curriculum policy and in the terms used to organize and structure policy, but also vary within jurisdictions. For example, an elementary school science curriculum policy may, apart from the content covered, exhibit different features than a secondary school curriculum policy for the same jurisdiction. The decision over what a policy should be called, how it should be organized, with what terms, and in what detail is a political process. For instance, The Queensland Studies Authority recently commissioned a team of researchers to review worldwide literature on curriculum policy and to draft a syllabus design prototype for all Queensland syllabus documents from PreK–12. This report was then subjected to a public review and development process in which various features of the report were debated. Depending on how this process ultimately unfolds, Queensland may be said to have a curriculum policy for curriculum policy.

Some jurisdictions have, as part of their overall curriculum policy, a policy on the process of revising curriculum policy. Part of such a policy is the specification of the basis for evaluating and revising curriculum policy. Such policies may require a scan of professional, academic, and public opinion and will normally specify review committee composition, timeline, and feedback mechanisms for proposed changes. These are special kinds of formal curriculum policy because they are directed to the education bureaucracy rather than to schools and school boards. With frequent government changes in elected systems, the formal authority of such policies is muted.

### A Neglected Topic

Curriculum policy is neglected in the research literature, though it appears as an overview topic in textbooks and handbooks. For example, it appears in neither the table of contents nor the index in the two-volume *International Handbook of Educational Policy*. One reason for this neglect is that

policy analysts tend to be administrator scholars rather than curriculum scholars. Their expertise is curriculum context and their interests tend to system process over curriculum practice. Another reason is that the writings that do exist on curriculum policy by curriculum scholars tend to be on philosophical and ideological concerns rather than on policy analysis. For instance, there is a recent curriculum policy literature on the impact of national testing and accountability policies, but the literature tends to be ideologically concerned with what is perceived to be the harmful influence of policy.

### Curriculum Policy Examples

#### *Missouri Show-Me Standards*

The language of standards is widespread in recent years, and curriculum policy now appears in documents called standards, for example, the Missouri Show-Me Standards. The Show-Me Standards are an outcome of Missouri's Outstanding Schools Act of 1993 and reflects Washington, D.C.'s national education agenda. The development process was initiated by the state governor's following consultation with business leaders. Three key groups were involved: the Education Workgroup, which wrote the standards; the Commission on Performance, which monitored the process; and a series of public reviews and forums. The final statement of curriculum policy reflected the interactions of these three players.

The statement of standards begins with a note to readers concerning what high school students should know and be able to do. The standards are divided into four goals and six subject areas. For example, the goal calling for students to gather, analyze, and apply knowledge is broken into 10 subgoals that are to be demonstrated by students both within and across the subject areas. Altogether there are 73 statements for the four goals and six content areas, the Missouri standards are presented in a slim two-sided, one-page document with goals on one side and content areas on the other.

#### *Ontario Curriculum Documents*

Formal curriculum policy documents and policy associated documents are known as *The Ontario Curriculum*. The document *Language, Grades 1–8* is a policy document that describes to the public

what is to be expected of students from the elementary language program. In contrast, *The Ontario Curriculum, Grades 1–8: English as a Second Language and English Literacy Development—A Resource Guide* is a resource document supporting the Grades 1 through 8 language policy. The complexity of documents, their close relationship on the Web site, and the suggestive language used in the resource documents blur the boundary between curriculum policy and resource documents. The Ontario resource documents are examples of implicit curriculum policy.

Ontario has no overall statement of curriculum policy. Policy is organized by subject within elementary (Grades 1–8) and secondary (Grades 9–12), with 9 and 18 documents, respectively, resulting in over 500 secondary school courses. Each document has a general subject overview; a general statement of expectations by grade groupings, 1 through 8 and 9 through 12; a breakdown by grade; a section on student assessment and evaluation; another on program planning; and a glossary. The language document noted above is 160 pages, and its implicit curriculum policy support document is 122 pages.

The organizing terms are *strands, expectations, knowledge categories, levels of achievement, and provincial standard*. Strands are organizing categories for knowledge and skills expectations. Expectations are divided into overall expectations and specific expectations and appear as detailed lists of subject by grade. For instance, reading is a language policy strand, and reading expectations are described overall for Grades 1 through 8 and in detail by grade. For assessment and evaluation purposes, a chart of knowledge categories by achievement level is provided. Each knowledge-level cell contains a description of what students can do. There are four levels. Level 3 is the provincial standard below which students are performing below expectations and above which they are performing above expectations. These are broad descriptions, and by policy, teachers are expected to use discretion on which general and specific expectations should be the basis for the assessment and evaluation of individual students.

*The Ontario Curriculum* describes the process for writing and revising formal curriculum policy. Curriculum policy documents are revised on a 7-year cycle. Wide consultation with the profession, academics, other ministries, parents, students,

nongovernmental organizations, business, and others in the public is combined with reviews of other jurisdictions and of the disciplines to determine needed revisions. Writing teams drawn from school boards are appointed.

## CURRICULUM PURPOSES

---

Curriculum purposes typically include the goals, aims, and objectives of an educational program. As such, purposes have long played a central role in curriculum studies. For Franklin Bobbitt, curriculum purposes focused on those skills necessary to adult life, but which were unlikely to be learned effectively outside of school. Ralph Tyler, unlike Bobbitt, did not argue directly for purposes that would concentrate on preparation for adulthood. Rather, his approach sought to identify the sources useful in formulating curriculum purposes. These

sources included studies of learners, studies of contemporary life, suggestions by subject matter specialists, and philosophy—thus providing a broad basis for addressing Tyler’s central question: What educational purposes should the school seek to attain? More recently, the objectives movement of the 1960s and 1970s took up the logic that any educational program should begin with a clear determination of what that program was to achieve. This emphasis on outcomes has also been evident in the standards and accountability movements that followed the publication of *A Nation at Risk* in the 1980s and the U.S. federal government’s efforts to establish definable outcomes in education.

In all of these examples, curriculum purposes have been intended to guide the outcomes of schooling. Nevertheless, purposes and outcomes are not necessarily the same. It is conceivable that a curriculum could deskill students or reinforce social prejudices even with admirable purposes. Whatever the outcomes of a program, its purposes are usually ameliorative; they seek to improve someone or something. On this point, two broad and overlapping traditions have characterized curriculum thought. One tradition focuses on social needs and the other on individual development. Both are considered below.

### Social Needs

Using social needs to determine curriculum purposes represents a longstanding practice. Plato adopted this approach when discussing the role of education in his ideal state, the Republic. Plato argued that youth should be taught according to their capacities to serve the city-state in one of three roles—that of artisan, guardian, or ruler. By doing so, both society and individuals would benefit, but in Plato’s view, the needs of society were prominent. The legacy of this approach is again seen in contemporary educational thought. One common example is the persistent belief that schools could serve as a melting pot to Americanize various ethnic and immigrant groups. The historical functions of endeavor were to ensure harmony among social groups and strengthen national stability. From the common school movement to the post-*Sputnik* Educational Defense Act of 1958, schooling has been touted as essential to the nation’s welfare.

These examples suggest a vision of social needs that seek to maintain the unhindered functioning of society. Such needs reflect society as it is. Thus, vocational education is often viewed as supplying the nation with a competent workforce, just as elite colleges are viewed as producing future leaders. A social needs approach, however, may also be based on a desire for social change. Such needs reflect society as it should be. This approach is often referred to as social reconstructionism. Its exemplars include George S. Counts’ book, *Dare the School Build a New Social Order?* Other examples of social reconstructionism include programs that seek to reduce discrimination based on race, class, gender, sexual orientation, and religion. Programs that promote peace education and teaching for ecojustice may also follow this approach.

### Individual Development

Curriculum purposes based on individual development, like those based on social needs, have a long history. The educational ideas of Jean-Jacques Rousseau and later those of John Dewey are often associated with this tradition. Both Rousseau and Dewey recognized the social nature of education and the needs that arise from conjoint living. However, they insisted that these needs be balanced with a person’s needs for self-actualization. Capable individuals guided by their particular interests and who can exercise their individual abilities and talents are regarded in this approach as the cornerstone of a good and just society.

However, to achieve these social goals, education cannot begin with general social needs or the broadly conceived national concerns. Instead, education must look to the individual students at hand. Their impulses, needs, desires, and motives serve as the driving forces behind curriculum purposes. From this starting point, Dewey believed that an individual’s education would develop to approximate social needs and genuine preparation for adult life. Yet adult conceptions of needs are usually distant and intangible from the interests and lives of children. Thus, educators guided by social needs must often coerce students into learning seemingly irrelevant content. Through rewards and punishment students can be compelled to imitate skills and to memorize all sorts of information, but the result leaves their education superficial.

Both the social needs and individual development traditions noted here embrace a wide range of aspirations and values often mentioned in relation to curriculum purposes. Some of these aims are more strongly associated with one tradition over the other, but few are exclusive to either tradition alone. The aims of multicultural education, for example, are often couched in the language of social reconstructivism. This perspective seeks to prepare students to contribute to a pluralistic society; one free of racism, sexism, and other forms of discrimination. Yet multicultural understandings may also build on and broaden the personal experience of students thereby promoting individual development. Character education, on the other hand, has usually been based on the importance of moral development as part of self-actualization. At the same time, strong arguments can be made for character education as essential to social restructuring. Critical thinking is an example that serves both traditions, but again in different ways. Some see critical thinking as developmental and necessary to how individuals derive meaning from their private and public lives. Others view critical thinking as a tool for social and democratic reform. This range of examples suggests that although curriculum purposes are not self-evident, they still are significant contributions to the design and evaluation of educational programs.

## CURRICULUM STUDIES, DEFINITIONS AND DIMENSIONS OF

---

Curriculum studies deals with a robust array of sources that provide the following: (a) *perspective* on questions about what curriculum is or ought to be, (b) alternative or complementary *paradigms* of inquiry that enable explorations of such questions, and (c) diverse *possibilities* for proposing and enacting responses to the questions in educational theory and settings of educational practice. This tripartite emphasis on perspective, paradigm, and possibility depicts substantive concerns of curriculum studies and serves as the organizing structure of this entry. A necessary beginning is to clarify the origins of curriculum studies.

### Origins

The term *curriculum studies* evolved during the past half century from its forerunner known as curriculum development, a term that emerged in the 1930s to designate a field that evolved at the beginning of the 20th century to facilitate curriculum (courses of study) for schools in the expanding project of universal schooling. Curriculum studies is a term that designates a shift of theory and practice as scholars sought understanding of curricula as phenomena of interest and societal import in contrast with sole concentration on service to leaders of practice in schools. By the early 1970s, widely recognized curricularists determined that their work should not primarily provide a basis for curriculum development in schools. They realized that if they simply served the will of schools, they were inadvertently supporting the will of those who made policy for schools. Such policy was thought to misrepresent public interests because it was conjured to fulfill the interests of the most wealthy and powerful members of society. This argument brought a wide range of scholarly sources to the forefront, such as diverse philosophies, literary and artistic works, and a range of social, political, and economic perspectives. Interests of equity and social justice, as well as self-realization and identity, have emerged as major topics of emphasis. The cause of societal maintenance that schools had long served was deemed limited if not puerile as a reason for scholarship.

Thus, the guiding questions of curriculum studies are pursued relative to whatever configurations of human association or community lend themselves to such pursuits and are not relegated to school alone. By 1982, the scholarly area of curriculum studies was fully instantiated by the educational research community, symbolized by the renaming of the curriculum division of the American Educational Research Association (AERA) as Curriculum Studies rather than Curriculum and Objectives, which was the name that had prevailed for the previous two decades.

The following sections discuss each of the three main topics of curriculum studies: perspective, paradigm, and possibility.

### Perspective

Curriculum studies derives perspective from the following: key questions it pursues, the field of inquiry, and its history, context, philosophy, and policy.

#### *Key Questions*

Introduced above, questions about what is worthwhile for human beings to grow into fully functioning individuals and contributors to the advancement of their social worlds is the central purpose of curriculum studies. Although pursuit of such questions traditionally has been considered a problem of schooling, it is now deemed a problem of any association of human beings or relationship among human beings that addresses these questions. To address these questions requires familiarity with bodies of knowledge accumulated by curriculum scholars and often summarized and reconceptualized in synoptic curriculum texts. Acquisition of such knowledge derives from a legacy of socialization into practical and scholarly dimensions of the field of curriculum studies. However, such socialization is not statically reproductive; rather, it embodies a strong call to imagination that builds on, and even departs from, the legacy of previous curriculum studies to create novel extrapolations. For instance, debate has ensued for many years about fairness and justice relative to answers afforded questions of worth. For instance, whose version of worth is being promoted or denied at a given time and place? The assumption is that other questions of education

(e.g., pertaining to management, finance, psychology of learning, remediation, subject matter learning, policy formulation and implementation, teacher education, professional development, change, or reform) are contingent upon questions of what is worthwhile.

In claiming the centrality of addressing the question of worth, curriculum studies ironically offers an equally strong caveat about doing so: Questions of worth are so complicated and complex that the greatest minds throughout history have been unable to answer them fully. Thus, curriculum studies is an area that staunchly advocates asking the most difficult questions about what human beings and their society are and should become and simultaneously realizes that answers to such questions can at best be partial. Nevertheless, children, youth, and adults abound in every culture, and they need to come to greater realization of who they are and might become—thus, the what, why, who, how, where, and when of that which is worthwhile. Because situational needs change often, these matters must be addressed continuously, realizing that answers to such questions cannot fully be known. Controversy abounds as experts do their best to partially answer what-is-worthwhile questions and as all human beings are admonished to ask such questions for themselves.

#### *Field of Inquiry*

The formal field of curriculum studies consists of many scholarly and practice-based organizations. There are too many to identify comprehensively, though most may be located in this encyclopedia. Larger associations range from the highly scholarly AERA to the practitioner-oriented ASCD (Association for Supervision and Curriculum Development), which caters primarily to curriculum leaders in schools. In addition, cutting-edge interests have led to the growth of numerous smaller organizations, such as the Bergamo Curriculum Group, Curriculum and Pedagogy, The Society for the Study of Curriculum History, the American Association for Teaching and Curriculum (AATC), and the International Association for the Advancement of Curriculum Studies, along with its numerous national affiliates. Several of these groups have their own journals. Three major curriculum studies journals (*Curriculum Inquiry*, *Journal of*

*Curriculum Studies*, and *Journal of Curriculum Theorizing*) have existed for several decades. Others have existed more briefly and include *Journal of Curriculum and Pedagogy*, *Curriculum and Teaching Dialogue* (by AATC), *Journal of Curriculum and Supervision* (by ASCD, but now discontinued), and one major curriculum journal for practitioners, *Educational Leadership* (by ASCD). Curriculum organizations are found in many different countries as well. Insofar as origins of curriculum studies reside in the foundations of education, many curriculum scholars turn to publications and meetings of the American Educational Studies Association, the John Dewey Society, the Philosophy of Education Society, and the Society of Professors of Education. Such associations and their publications constitute organizational foundations of curriculum studies. Journals such as *Harvard Educational Review*, *Teachers College Record*, *American Journal of Education*, and AERA journals carry key articles on curriculum studies, though they publish articles on many other educational topics. In addition, major publishers of educational books (e.g., Peter Lang, Routledge, Taylor Francis, Teachers College Press, SAGE, ASCD, Jossey-Bass, Information Age, Corwin, State University of New York Press, and other university presses) often have sizable holdings or book series in the area of curriculum studies.

### *Curriculum History*

Curriculum history can be construed as the history of curriculum studies as a realm of inquiry, or it can be considered as a source of perspective for engaging in curriculum studies. As a realm of inquiry, curriculum studies emerged in the late 1970s when scholars in the field revealed inequities and injustices of educational opportunity based on such factors as socioeconomic class, race, gender, age, language, ethnicity, culture, sexual orientation, and nationality. They no longer saw their mission as simply doing research on how to more efficiently and effectively develop, design, implement, and evaluate curriculum that perpetuated inequities promoted by state and the corporate interests. Therefore, these scholars studied and exposed the values and assumptions implicit and explicit in policies and practices that led to

unjust learning experiences in schools and other organizations. Similarly, they portrayed and proposed practices that overcame injustice. Today, curriculum studies scholars continue efforts to expose injustice, illuminate possibilities, and enhance pursuit of that which is worthwhile. They hope such work leads to more fully functioning persons and greater experiences of goodness and justice for human beings.

History of efforts to seek that which is worthwhile can be traced to time immemorial in innumerable proposals or countless ponderings of parents and communities about how to induct the young into life. Any of this is precedent for curriculum studies. Documentary and interpretive work within the relatively short history of universal schooling provides an abundant source for curriculum scholars to tap as they attempt to analyze, interpret, critique, and advocate for improved curriculum theory policy and practice.

### *Contextual Studies*

Considerable perspective for those who work in curriculum studies derives from sociology, anthropology, psychology, economics, political science, geography, ecology, cultural studies, and other areas of study that enable increased understanding of contexts in which curricula are embedded. The study of such factors from a curriculum studies framework is much different than it was during the curriculum development era that preceded it. In the curriculum development era, contextual factors were studied for the purpose of overcoming them in order to efficiently implement already determined curricular purposes. Scholars in the curriculum studies era resisted this instrumentalist purpose of research, seeing context not as enemy or impediment, but as a source of understanding. Hence, today curriculum studies hails study of contexts of schools or any other institutions of education as sites of critique and sources of understanding. Moreover, curriculum studies holds multiple dimensions of context as curricula worthy of intensive study—forces that interact with human agency to shape lives and relationships with the world.

### *Philosophy and Curriculum Theory*

Because curriculum studies focuses on that which is or ought to be deemed worthwhile, it

turns to philosophy, the realm of assumptions. In traditional philosophy, assumptions are often categorized according to perennial realms of metaphysics (nature, including human nature), epistemology (conceptions of truth and diverse ways of knowing), axiology (bases of value), ethics (conceptions of good and evil), aesthetics (theories of beauty or pattern), politics (positions on how to live together), and theology (beliefs concerning deified or spiritual realms). During the curriculum development era, theorists tried to discover pragmatic means of achieving preordained ends, often using empirical and analytic methods of inquiry. Drawing from John Dewey's more complex notion of pragmatism, however, those in curriculum studies seek to understand through attention to a holistic range of consequences—from intended to unintended. Further, curriculum studies builds on philosophies of idealism, realism, naturalism, and theology, as well as on more recent perspectives (e.g., existentialism, radical psychoanalysis, phenomenology, critical theory and critical race theory, deconstruction, and postmodernism) in attempts to understand human conceptions of what is worthwhile and actions upon it. Even if philosophy is not consciously engaged, certain assumptions rule human affairs by default in the sense that everyday volitions and actions are built upon habit, policy, resistance, deliberation, and imagination. In turn, all of these are contingent upon philosophical assumptions. So by taking a proactive posture, curriculum studies exemplifies a central assumption that all educational inquiry and endeavor should be accompanied by thoughtful philosophical considerations. One might say that engaging in curriculum studies is to embrace a never-ending quest wherein philosophy is embedded in action for the purpose of making life more worthwhile.

### *Curriculum Policy*

Curriculum policy is usually a function of social policy and large educational policy. Positively, it is a construction drawn from careful analysis of the key questions, resources of the field, history, context, and philosophy pertaining to curriculum studies. Negatively, it is an autocratic imposition orchestrated for the benefit of wealthy power wielders, who manipulate curriculum and educational

situations to sustain their own advantage at the pinnacle of the societal sorting machine.

Policy analysis in curriculum can focus on explicit, intended policy and how it is implemented and evaluated. In addition, it can focus on covert policy designed to control the poor, middle, and professional classes for the benefit of the elite classes. The intended curriculum, overt or covert, may be productively analyzed and interpreted relative to the extent that it is effectively carried out—a process known as treatment specification and verification. Or it may be interpreted more subtly in terms of how participants began with an initial sense of direction or disposition and through ongoing self-evaluation enabled policy to evolve new forms more tailored to the needs and interests of participants most closely involved with it. In either orientation to curricular policy, a number of curriculum venues emerge for analysis, interpretation, critique, and evaluation. One of these is hidden curriculum, which has at least three meanings: first, subtle messages that educators intend to convey, such as politeness or interest in learning; second, subtle messages that educators convey without intent due to personal mannerisms, such as screaming that learners should treat one another with compassion or autocratically teaching principles of democracy; and third, conveyance of structural attributes of the larger society in which the educational organization is embedded, thus perpetuating racism, classism, sexism, ageism, and the like. Curriculum policy analysis might also focus on the null curriculum—that is, that which is not taught (philosophy, alternative political systems, economic understandings, and human relations) or that which is given short shrift and first to be excluded from the budget (the arts, music, health programs, and ecological awareness). Policy, in this regard, might best be reflected in budgetary proportions of emphasis. The taught curriculum, too, can be analyzed to show multiple interpretations of how the intended curriculum is purveyed differently by different teachers. The tested curriculum bespeaks a limited band of emphasis on all that is learned, the learned curriculum, in any educational setting. Moreover, the learned curriculum might be quite different from *the embodied curriculum*, or that which is internalized and becomes part of a person's lived experience.

## Paradigm

The term *paradigm* has been appropriated from the history of science, particularly the work of Thomas Kuhn, and applied to many fields, including curriculum studies. It refers to a composite of values that shapes thought that governs inquiry in a given field. Accepted inquiry in a field of science governed research in that realm for a time, standardizing practices, until anomalies emerged in significant proportion to require alteration of the paradigm, promoting moves from Newtonian to quantum physics, from pre- to post-Darwinian biology, from pre- to post-Euclidian geometry, from Ptolemaic to Copernican astronomy.

In curriculum studies and in psychological and social sciences, there has been domination by the empirical-analytic paradigm, which is challenged by the hermeneutic-practical paradigm, the critical praxis paradigm, and the postmodern antiparadigm. In some ways, paradigm is closely related to ideology, which is a complex configuration of perspective forged from historical, cultural, social, ecological, economic, political, religious, and philosophical contexts combined with personal and communal acts of agency of acceptance, contestation, resistance, adaptation, reconceptualization, reconstitution, and reconstruction. Thus, categories of curriculum thought that represent ideological differences merge in complicated scenarios with paradigms of curriculum inquiry that represent orientations to inquiry or epistemological bases. Although space does not permit analysis of interactions between paradigm and ideology in this entry, paradigms are briefly depicted below, and readers are encouraged to meld them with ideologies as represented in different category schemes of curriculum theory and practice.

### *Empirical-Analytic Paradigm*

Dominant during the curriculum development era and still today in policy circles, advocates of this paradigm seek credibility by imitating their impression of research done by natural scientists, social scientists, and psychologists. One strong root of curriculum development traces to the rise of experimental psychology at the beginning of the 20th century. Another root traces to foundations of education, particularly to pragmatist philosophy derived from work by Dewey, William James,

and Charles S. Peirce. Pragmatist roots relate to practical and critical paradigms, which are discussed next. Empirical science builds upon the psychological roots and as a basis of credibility touts discovery and application of basic principles or law-like propositions to guide curriculum development, instructional delivery, and evaluation that involve significant forms of tests and measurements. Built within a structure of control that includes many layers of supervisors and workers, couched within a means-ends or process-product linear rationality, this paradigm is used to serve the rationale for large-scale policy endeavors such as *No Child Left Behind* (2000) and *A Nation at Risk*. These U.S. efforts bespeak assumptions of control and certainty that fuel the empirical-analytic paradigm, even if it is more often rationalization for subtle political and economic maneuvers than genuine rationale to enable pursuit of that which is publicly deemed worthwhile. It sports the appearance of careful definition and analysis and treatment specification and verification and treats research and knowledge as value free and objective, reliable, valid, and replicable. Emphasizing test scores as a key indicator of success or failure, advocates of this paradigm display their regard for parsimony and acceptance of constructed social and intellectual reality as a reality as virtually unattainable. It continues to be the dominant approach used by those who design instructional materials, advocate accrediting compliance, and design and follow lesson or unit plans rather than enable them to evolve through faith in participants' abilities to discover their situational needs.

A four-part conceptualization of principles of curriculum, derived from the work of Ralph Tyler, has been appropriated since the early 1950s by those who function in the empirical-analytic mode. Self-appointed disciples of Tyler have made his principles more linear and recipe-oriented than he intended. Despite the fact that Tyler clearly stated that his topical considerations were not to be followed as a recipe, but rather addressed needs emerged in the spirit of pragmatic philosophy, most adherents saw them as the following recipe: clarify purposes, select learning experiences to achieve the purposes, organize learning experience to horizontally and vertically deliver purposes, and evaluate to determine how well the purposes were achieved as a basis for curriculum revision. Although

applied most often to school curricula, this procedure was offered for any kind of educational setting—large or small, formal or informal. Since the 1950s, scholars of many ideological and intellectual persuasions and paradigmatic orientations have debated interpretations of central elements within the Tyler Rationale. They have considered the relative value of global or broadly stated purposes, behavioral or specific observable and measurable objectives, expressive objectives that seek imaginative surprise, and evolving purposes that begin with a sense of direction and change through inquiry by those in grassroots situations. Debate often rages over how sources of purpose should be balanced, identified by Tyler and augmented by many subsequent scholars: philosophy, psychology of learning, learner interest, social need, and subject matter interpretation. Such topics trace back to Dewey and other educators at the conclusion of the 19th century, when the curriculum field was in its infancy. In addition, debate centers on criteria for selecting purposes, both substantive (socialization, achievement, personal growth, social change) and procedural (representation, clarity, defensibility, consistency, feasibility). Although dimensions of these debates could be exclusive to the empirical–analytic paradigm, many relate more to the hermeneutic–practical paradigm and to the paradigm of critical praxis. Debate and deliberation have also continued on the other three topics identified by Tyler (learning experiences, organization, evaluation), turning dynamically and often dramatically on criteria for selecting positions within each. Curriculum scholars have attempted to clarify assumptions upon which selection is based and judgment about the impact of consequences of acting on them. Since the 1950s, scholars in curriculum studies have identified a host of contextual factors that have strongly influenced criteria and selection of purposes, learning experiences, organizational patterns, and modes of evaluation. Alternative paradigms have emerged to explore these matters and to seek other topics for consideration in addition to those within the Tyler Rationale.

### *Hermeneutic–Practical Paradigm*

Hermeneutics traces back to Judaic theology and practices of reinterpreting sacred texts.

Through phenomenological and existential thought, hermeneutics in the contemporary era has referred to interpretation of the metaphoric texts of one's life world. In curriculum studies, the notion of hermeneutics, then, becomes the interpretation of diverse discourses of experience that give meaning to one's life. Coupled with practical inquiry, which derives from both the practical deliberation of Joseph Schwab and the pragmatism of Dewey, curriculum becomes a quest for understanding where we come from, who we are, who we hope to become, and how we hope to live in and contribute to the world. William Pinar, Madeleine Grumet, and others have called this *currere*, the verb form of curriculum; *currere* is an active effort to understand through interaction with the world rather than through detached induction and deduction about it. Such inquiry seeks situational insight that enlightens ethical, aesthetic, and political decision and action within lived experience. *Currere*, then, is considerably different from conventional notions of curriculum as a journey or production set out in advance to be followed; it is an experiencing that evolves with pursuit of understanding.

### *Critical Praxis Paradigm*

Although curriculum studies scholars of this paradigm respect the ideals of *currere*, they argue that it is impossible to engage in interaction that is not politicized by unequal power relationships. Injustices, inequities, and oppressions of power need to be exposed as embedded in false consciousness and productive of unfair advantage. It is deemed necessary to critically question such matters at the grassroots level. Paulo Freire argues that it is necessary to engage in theorizing in the course of action that liberates from the bonds of oppression—political, social, economic, cultural, and psychological. In the early 20th century such questions were asked by educators, both within and outside the curriculum field. Within the field there were such scholars as Harold Rugg and George Counts, who along with Dewey, raised consciousness about the need to reconstruct society into a less greedy, acquisitive, and warlike place. Outside the field, sadly kept outside by racial prejudice of the day, there existed similar questioning of oppression raised by African American scholars, such as

W. E. B. Du Bois and Carter G. Woodson. During the move from preoccupation with curriculum development to curriculum studies, Michael Apple and Henry Giroux were two prominent voices from the 1970s to the present who urged curricularists not only to ask questions about what is worthwhile, but also to explore who decides what is worthwhile and consequences that accrue from alternative images of what is worthwhile. Critical praxis has been influenced considerably by Freire's challenge to read and write their worlds. An ideal, then, is to move toward new conceptions of public spaces, to use Maxine Greene's language, through the re-creation of learning webs that Ivan Illich proposed should evolve in free and democratic spaces. The point is to replace autocratic, oligarchic corporate governments that purvey ideologies of domination and seek global colonization (often under labels of freedom, democracy, and justice) with grassroots participatory democracy that has been largely an unpracticed platitude. Movement toward democracy and justice requires modes of inquiry that are decolonized and listen to subaltern voices, such as advocated by Linda Tuhiwai Smith.

### *Postmodern Antiparadigms*

Drawn from work by such philosophic thinkers as Jacques Derrida, Michel Foucault, Ferdinand de Saussure, Jacques Lacan, and James C. Scott, curriculum studies scholars such as William Doll and Patrick Slattery offer a caveat about master narratives of many kinds, including the idea of paradigms. Holding with some advocates of critical praxis that grassroots public spaces are the rightful seedbeds for curriculum studies and for social practices that emanate from them, postmodernists argue for a plurality of simultaneous narratives. This position counters the issue of which paradigm or ideology should dominate because all can be critiqued as master narratives. Nevertheless, postmodernists could be criticized facetiously for holding a master narrative that claims there are no master narratives. Some argue that eclecticism is a natural ally of postmodernism, whereas others hold that eclectic matching or tailoring of theory and research to situational needs is still too mechanistic for the shimmering waves of narrative that can barely be experienced, let alone grasped and applied.

### **Possibility**

Possibilities for curriculum studies are derived from diverse perspectives and paradigms. Some of these are encapsulated below, often as questions or lines of inquiry being studied today.

- What is worthwhile? This key question is addressed by farsighted curriculum leaders in schools and other educational institutions as well as by theorists in curriculum studies, as has been shown by James Henderson and Kathleen Kesson, among others.
- What is worth knowing, experiencing, doing, needing, being, becoming, overcoming, sharing, and contributing? Variations on such questions are finding their way into the curricular experiences of children and youths through innovative educators who realize that when curricula are organized around these existential human interests, learners seek to grow without manipulation or extrinsic motivation. Narratives of Sylvia Ashton Warner, Vivian Paley, Herb Kohl, Jonathan Kozol, Brian Schultz, Greg Michie, and Michelle Foster provide vivid examples.
- What can be done to increase meaning, goodness, and happiness in lives of young persons—in all our lives? William Ayers and others have urged focus by educators on building curriculum and teaching upon strengths as an antidote to the traditional propensity to build upon deficits.
- What prevents focus on meaning, goodness, justice, and happiness in schooling and in other forms of education? Apple, Linda McNeil, Alex Molnar, Susan Ohanian, Peter McLaren, and Angela Valenzuela are among those who show that interests of wealth and cultural domination too often create mandates that push emphasis on meaning, goodness, justice, and happiness in human lives to the sidelines of concern.
- How does the nexus of power (corporate, military, governmental, religious, and media) that strives for empire prevent progressive educational practices? Noam Chomsky, Joel Spring, John Willinsky, Pauline Lipman, William Watkins, and Giroux are among those who call for understanding of the immense power that has coagulated to perpetuate a worldwide culture that makes the wealthy wealthier and

even places them into leadership of a new world government.

- How can alternative forms of inquiry and modes of expression counter hegemonic practices? Narrative, biographical, autobiographical, and artistic forms of inquiry as advocated by Greene, Elliot Eisner, Sarah Lawrence Lightfoot, Thomas Barone, Ming Fang He, JoAnn Phillian, Michael Connelly, Jean Clandinin, Freema Elbaz, Max van Manen, Janet Miller, Craig Kridel, and George Willis offer a diversity of examples in this regard.
- How do class, race, culture, gender, ability, health, membership, age, appearance, place, belief, ethnicity, sexual orientation, status, nationality, reputation, and other factors influence education and other opportunities? Work against prejudice based on one or more of these factors of domination is exemplified in writings of William Watkins, Michele Fine, Lois Weis, He, Luis Moll, Grumet, Carl Grant, Nel Noddings, Jean Anyon, James Anderson, James Banks, Cherry Banks, and William Reynolds.
- How can the lore of educators (including parents and students) contribute to insight about matters mentioned in these questions? The voices of all of these, especially from those in-between cultures, form numerous curriculum scholars: He, Chris Carger, Bernardo Gallegos, Lisa Delpit, and Ayers.
- How can we focus more broadly on education, seeing schooling as one of several educative forces that create us and our sense of identity?
- How can we better understand intended, taught, null, hidden, and learned or embodied dimensions of curricula in schools and outside-of-school venues (e.g., in homes, families, churches, gangs, peer groups, radio, television, movies, computers, video, videogames, popular print, sports, stores, clubs, dance studios, music, art, hobbies, jobs, and more)? Countless authors abound, many in fields adjacent to curriculum studies, as well as within it.
- How can we understand each other's autobiographies and aspirations empathically? Work by William Pinar, Grumet, Janet Miller, Susan Edgerton, He, and Mary Catherine Bateson are exemplary.
- How can we build on strengths with faith in the goodness of human potential?

This last question, as well as those that precede it, is an invitation to readers to imagine their own responses and to create more questions of worth because that illustrates the spirit of curriculum studies.

## CURRICULUM STUDIES, THE FUTURE OF: ESSAY 1

---

We can think of six specific traditions of analysis that have had and will continue to have an impact on curriculum studies: technical, aesthetic, autobiographical, ethical, political, and historical. The first, technical, is concerned with what works—that is, its primary impulse is to examine the ways in which curricular and pedagogical goals are met. The second, aesthetic, treats curriculum as a construction that is best understood through the lenses of the arts so that it participates in the drama of creating meanings. The third, autobiographical, asks what curricula mean in terms of the actual experience of students, teachers, and others involved in the educational encounter. The fourth, ethical, is deeply concerned with curriculum as a moral encounter. It asks educators to treat others in a manner in which they would agree to be treated, in essence, to do unto others as one would do unto oneself. The fifth, political, is involved in questions of social justice. It is grounded in a clear commitment to equality; to asking about the differential class, race, gender, and other effects of our assumptions, policies, and practices; and to constructing curricula that interrupt dominance. Its guiding questions tend to be, “Whose knowledge is taught? To what effect?” Finally, the sixth tradition, historical, is dedicated to documenting the ways in which each of these other traditions has a significant past, a past that is filled with limits and possibilities.

Indeed, an important part of dealing with the future of curriculum studies is a firm recognition of the varied nature of its past. Many of the questions that are currently on the agenda of curriculum scholars have a long history. Although the theories that guide current research are at times more elegant and nuanced than past work, current and future scholarship becomes much more meaningful if it is connected to the issues and concerns that have guided the field since its inception. Thus, part of our task is the continual restoration and broadening of collective memory and to raise the question of who participated in or was marginalized by these historical processes and events.

Each of these six is and will continue to be crucial. Each serves as a corrective to the others. And each requires increasing levels of qualitative, quantitative, theoretical, and analytic sophistication, as well as a keen sense of the complexities involved in the practical matters of creating curricula in what are deeply complicated and often unequal institutional contexts. Increasing our sophistication and our institutional sensitivity is crucial for the future for a number of reasons.

One of the major dilemmas confronting curriculum studies will continue to be the problem of borrowing. In order to engage in serious and disciplined inquiry into the many issues that confront us, curriculum scholars have turned to other areas of knowledge and experience. Fields as wide-ranging as analytic and continental philosophies, aesthetics, phenomenology, politics, sociology, anthropology, action research, critical theory, critical cultural studies, Marxism, feminist research, postmodernism and poststructuralism, history, cognitive science, developmental psychology, and many other areas have been drawn upon. This fact is important because one of the most important tasks of the curriculum person is to “see the forest as well as the trees.”

Yet this act of borrowing in itself creates serious difficulties if not done very carefully. Surface level understandings are often imported into the field, thereby contributing to what has become a serious problem in curriculum studies.

This problem has had an effect. Much of the field has been rhetorical. It has at times been satisfied with slogans at the expense of substance, and this tendency cuts across all its various traditions. There is nothing necessarily wrong with such

discourse. Indeed, language can be used for many things. It can be employed for the purposes of description, explanation, control, legitimation, mobilization, and other things. However, when one form of language begins to dominate—legitimizing or mobilizing language, for example—concerns about evidence, logic, competing moral claims, and similar things may begin to be seen as less important.

This problem is not the only one we face. Unfortunately, the field has participated in deskilling itself as well. There were very good reasons for both the turn away from positivist understandings and techniques and the turn toward qualitative models. However, this shift has had the covert effect of reducing the field's ability to engage in and criticize the best of quantitative analysis. This tendency is damaging because it positions the field outside of some of the most important discussions of the effects of educational policies.

Other problems remain as well. We have been wedded to a particular institutional site—the school. Yet among the fastest growing movements in the United States and now in a number of other nations is home schooling. Much of this movement is grounded in conservative cultural and religious positions. This tendency points to a fundamental understanding that will need to be taken into account in future curriculum research. It is often social movements, not simply educators, that are the engines of educational transformation. Considerably more attention will need to be paid to social movements, both progressive and conservative. Thus, to more fully deal with the complexities involved in the ways the curriculum is actually determined and generated, curriculum studies will need a firmer grounding in critical cultural and social analysis.

In addition, much of the literature, including segments of the critical and postmodern—poststructural traditions, has cut itself off from crucial connections with issues of classroom practice. That curriculum studies has gained increasing academic respect is a partial gain. But that gain can be accompanied by a loss. The daily problems of building, defending, critiquing, recreating, and teaching important knowledge can get turned into forms of pollution, issues that are seen as not academically respectable.

This view would be a grave miscalculation and would cut us off from valued parts of our past. It

also runs the risk of forgetting that the primary object of curriculum studies is ultimately the concerns surrounding what does and does not count as official knowledge and how it is selected, organized, taught, experienced, and evaluated. The ultimate goal of curriculum studies is a form of praxis, theory, and research made sensible and alive through their organic connections with the deliberative practice of educational institutions and the students and educators who participate in creating and recreating them. Thus, future curriculum studies face many challenges. But a recognition of the complexity of what needs to be dealt with is an important step on the road to progress.

## CURRICULUM STUDIES, THE FUTURE OF: ESSAY 2

---

In a 1930 speech, W. E. B. Du Bois reconciled the need for both academic-liberal studies and industrial training as part of the curriculum African American college students needed to confront the realities of the current day and the future. He saw

industry, commerce, capital, and credit transforming into a superorganization with global influence and wanted the Black community to be in a position to create its own independent institutions of commerce, capital, and so on and have a role in transforming this superorganization to improve the lives of Black people instead of being enslaved by it.

Eighty years later, the need for a curriculum that prepares students to participate in a diverse society and global community is perhaps even more urgent for poor and working-class students. The United States and the world are breaking new boundaries as demonstrated by the first African American U.S. president, global acknowledgment of environmental and energy crises, the emergence of China and India as world powers, U.S. relationships with Arabic and African nations and our southern neighbors of color in Mexico and in Central and South America, and so on. As an increasingly diverse society in the global community, how we prepare all future generations will have a direct impact on our nation's place in the world.

The future of curriculum studies will require not only academic discussions of high theory, but also a continuous struggle over the direction and focus of what is taught. Today, the focus on accountability and outcomes has had a profound impact on school curriculum and classroom pedagogy. Current national educational legislation and policy instituted mandatory student assessment tests, which, not surprisingly, drive the curriculum at the state and local levels. This revitalized behavioral approach using performance objectives and systems management reduces curriculum to certain prescribed knowledge that prepares students to pass the test. Curricular questions of what, how, and why certain knowledge is selected and whose interest it serves, as well as questions concerning the testing industry itself, have taken a backseat to the resurgent obsession of testing and measurement. Interestingly and troublingly enough, both the prescribed curriculum and testing and measurement serve the same ends—they reinforce and preserve the societal hierarchy through the elevation of certain groups of students and the subordination of others. The results of high-stakes testing is a structured differentiated curriculum—children of middle-class families receive discipline-centered pedagogy, which gives them access to higher levels of knowledge, while working-class urban or rural

poor students receive basic instruction. Consequently, when all students confront the same state-sponsored assessment test, it is not difficult to hypothesize which students will score better. The use of testing as a diagnostic tool is one thing, but using it as a life sentence is a very different purpose. There are those who support this test-driven policy, perhaps because of strongly held beliefs that it forces uninvested or apathetic teachers to teach. Such sentiment comes from those who are justifiably concerned about and have critiqued failing performance in poor underserved schools. Yet a lingering concern for this curricularist is why is there such insistence and persistence on hierarchically structuring, measuring, and assessing humanity.

One of the great and long-term challenges for curriculum studies will be to interrogate the White patriarchal need for, and fear of not having, control and power over others, especially the darker other, and how this need manifests itself in curricular decisions and classroom pedagogy. The challenge will be to acknowledge the humanity of people of color in a way that relinquishes the necessity for hierarchical structuring and the mis-measuring of humanity. Vanquishing this scared belief and nurturing a belief that envisions humanity as symbolically kin will be the future challenge for curricularists and society at large. The United States and its Western allies will, at the very least, have to come to terms with sharing their positions of dominance, influence, power, and control in the global community and in future space exploration. This sharing may be why the West is so unyielding in its belief, spoken and unspoken, that objective science and measurement can demonstrate gradations of humanity.

Curricularists cannot wait for a sea change—we must make the sea change by taking what we know, believe, and theorize and in a concerted effort with teachers, work to implement curriculum that addresses the aforementioned issues of today and tomorrow, lifelong learning and preparation for the adult world of work. The future of curriculum studies will be trench warfare. The challenge is the actual constructing and implementing of a curriculum in spite of outside policies and politics and in the face of dysconscious racism among educators themselves. The future of curriculum studies is as a crack in the monolith, created from relentless eternal vigilance, and realization that the struggle

for control of curriculum will continue well beyond us: It is an unending struggle over policy, institutions, beliefs, worldviews, and paradigms.

Yet with all the concerns and challenges, societal transformations are occurring, an occurrence that should encourage curricularists to work with teachers to implement, lesson by lesson, curriculum development and organization. Change begins small and individually with teachers who are interested in curriculum development and who are willing to navigate through state standards to produce curriculum that provides students with knowledge and perspectives that embrace attitudes and behaviors for living and working effectively and respectfully with diverse groups of people at home and abroad. We must return to our roots to work in developing curriculum and playing with ideas that encourage teachers to teach their students how to manipulate knowledge and why they are allowed to do so. The future of curriculum studies will be the challenge to provide students with academic and technological sensibilities to live in a global community with a clean environment, ecologically friendly lifestyles, and a commitment to work for peace at home and abroad. Change comes over time. Our curricular task is to realize and plan for change today and tomorrow.

## CURRICULUM STUDIES, THE FUTURE OF: ESSAY 3

---

Curriculum studies is a field whose future must grapple with the cultural significance of curriculum as a symbolic act. Reconceiving curriculum from the perspective of culture will require a radical rupture in curriculum thought. Consequently, I draw on Clifford Geertz's seminal essay "Deep Play: Notes on the Balinese Cockfight" to liken the curriculum to culture. Geertz's analysis of the Balinese cockfight recognizes the doubleness of cultural events, as well as the fact that events are not really real, but are made real through interpretation. The cockfight is a critical element of the culture of the Balinese in which blood sacrifice is offered to the demons to pacify their ravenous, cannibalistic hunger. Prior to any major temple festival, holiday, or ritual, a cockfight is held. However, as Geertz suggests, it is not just cocks fighting. The identification that Balinese men make with their cocks is a complex one. In Balinese culture, there is a profound revulsion of animality (anything to do with animals) because it is the direct inversion of what it means to be human, and yet men are obsessed with their cocks and the cockfight. The doubleness of the cockfight suggests that the Balinese man is identifying with what he most fears and hates, and ambivalence being what it is, he is fascinated by the power of darkness. I would like to suggest that, like a cockfight, curriculum represents what is most feared—darkness and death and the inevitable unknown that accompanies it. The crosswise doubleness of the curriculum rests in the projection of an ideal (the known) and the projection of what is most feared (the unknown). The struggle (or cockfight) over curriculum reflects not only the fight over the need for control, but also the profound fear of the unknown. When curriculum serves as the really real, it keeps fear, darkness, and death at bay. Ironically, it is this fear that keeps curriculum from being a living, breathing presence. In order to live, the curriculum must die.

The curriculum, like the cockfight, is a cultural symbol through which there is an ongoing negotiation of meaning. Culture is not universal and static, but is always an interpretative act engaged in reading the text of life. The cockfight is not just a cockfight, but a bloody drama in which fears, tensions, and desires are negotiated. Cultural rituals and rites are, as Geertz maintains, symbols that signify layered and deep meanings. The curriculum is not just curriculum, but functions on a highly symbolic level. Curriculum, like the cockfight, is the bloody drama in which we might liken the U.S. school children as the sacrifice to assuage the fear of the unknown or not knowing. As part of this culture, curriculum theorists are implicated in this bloody drama.

I draw on Geertz's essay to begin my thoughts on curriculum for a number of reasons. First, it is provocative, and much like my initial attraction to anthropology, it is intended to make the familiar strange. Curriculum has functioned for me as a window into the world. Curriculum questions foundational and fundamental aspects of a society: What is knowledge? What knowledge is valued? Who can be a knower? The ways in which these questions are understood and answered are critical to the production of subject identities and the possible identities made available in any particular time and space. It is this relationship between knowledge, identity, power, and culture that curriculum theory seeks to address.

As in the cockfight in which cultural desires, fears, norms, and values are articulated, I understand curriculum to be a symbolic space. As a common ritual in which all members of society engage, the curriculum is a cultural space that has functioned historically, politically, culturally, and socially as a contested site. There has never been a curriculum (just like there has never been a Balinese). As a cultural text, the curriculum serves as a space (just like the cockfight) to negotiate the deep tensions and contradictions of what it means to be human. The cockfight is no more about the feathers, blood, crowd, or money than the curriculum is about objectives, lesson plans, and tests. Curriculum is no more really real than the Balinese cockfight is real.

As symbolic, the curriculum, like the cockfight, is not about death in a literal sense (although we might argue that schools are killing children), but

is about our fear of death (of not knowing). Embracing fear entails looking death in the face and being present to it. This embracement requires a suspension of the future (which is a construct that functions to ignore death through the illusion of control) and the past (which is required as a means to have the illusion of progress). Dominant notions of curriculum can exist only within a linear temporality. Curriculum as a symbolic space requires that we rethink temporality outside a linear epistemology in which curriculum is inevitably predicated on being really real. This space is a geography that resists the real not because it does not exist, but because the meanings we give to the curriculum are more illuminating than the curriculum itself.

Meanings are illusive. As Madeline Grumet suggests, curriculum is a moving form. To continually be in motion with no set direction requires the ability to be in the present. Being present requires a rethinking of temporality in which we are not planning for the future or longing for a past, but in which we are engaged in the process of becoming. As curricularists, this requires the ability to let go of our most deeply cherished beliefs in light of new ways of seeing the world. Suspending our theories and beliefs (in essence, letting them die) in order to be present is a difficult task. This requires that we confront death.

Confronting death and dying is not a new idea. In 1969, Joseph Schwab declared that the field of curriculum was moribund. This death was the result of curriculum's focus on timeless and universal truths. Instead, Schwab sought a living curriculum, not one concerned with absolutes, but one that was alive with questioning, deliberation, conversation, and dialogue. Education should not prepare students for the future; rather, it should enable them to be present. To engage in the ongoing conversation that is curriculum is to recognize that curriculum is not a product. Despite efforts to reduce curriculum to something tangible, something measurable, something technical, I would argue that curriculum plays no functional or practical (in this sense technical) role. Even basic curricular metaphors are not really real. By reducing the complexity and mystery of the human experience, as Dwayne Huebner suggests, to the technical terms of control—such as the learner or the purpose—the curriculum

abstracts the students, making them not real, in essence dead.

Curriculum as a symbolic act signifies our deepest anxieties wherein schools symbolize either order (control–death) or failure (chaos–life). Curriculum, like the cockfight, is not about something really real, but has become the space in which our fears are played out. I would maintain that this fear is the unspeakable—the darkness, the unknown. How does learning occur? We do not know. What should students learn? We do not know. Curriculum as absence—this might be the starting place for conversation. How might we envision a curriculum of not knowing? What might a curriculum that is present to itself require? When curriculum is understood as symbolic, we enter a space in which the profound human capacity for meaning making is illuminated. Meaning making, as the cockfight suggests, is complex, contradictory, and paradoxical. Curriculum is complex, contradictory, and paradoxical. Rather than suggest that we know the learner or the purpose of learning we might, as Margaret Mead suggested, understand curriculum as the readiness to use unknown ways to solve unknown problems. In embracing the unknown, in facing the death of curriculum, we can perhaps be present to the sacred and symbolic nature of curriculum.

## CURRICULUM STUDIES, THE FUTURE OF: ESSAY 4

---

The future of curriculum studies, a distinctive specialization within the academic field of education, is uncertain. This uncertainty is due to external influences and related internal disruptions. Because school reform focuses on improvement in students' scores on standardized examinations, curriculum has become relegated to a means to an end. Forty years of school reform in the United States have reshaped U.S. curriculum studies: first, by removing its main professional preoccupation—curriculum development—and then by reducing the significance of the curriculum itself—and by implication, the significance of its study—in accountability schemes.

Given these circumstances external to the field, it is unsurprising that shifts internal to the field have been dramatic in nature. That loss of curriculum development as primary domain of labor precipitated nothing less than a paradigm shift during the 1970s, forcing the field to shift its work and its identity from curriculum development to understanding curriculum. Having rejected the bureaucratic instrumentalism of the curriculum development period (informed by Tyler's Rationale), the field moved toward theory, employing concepts from social theory, phenomenology, poststructuralism, and feminist and critical race theory. These scholarly efforts to understand curriculum did not retain their distinctive identities, but mixed and blended with each other, producing, in many instances, hybrid theory characteristic of cross-fertilization. In contrast to this tendency, efforts to understand curriculum in multicultural terms broke into separate identity-based streams of scholarship: indigenous education, Black studies, and queer theory. In recent years, identity politics has become not only more separatist, but also more shrill, attacking scholarship that does not privilege identity as central in curriculum considerations.

At the same time, a small group of curriculum studies specialists—akin to counter-reformationists during Europe's 16th century—proceeded as if the paradigm shift did not occur, extolling the work of the key figure of the first paradigmatic moment—Ralph Tyler—and employing schemes as if they had not been discredited. Other counter-reformationists

focus nostalgically on earlier periods when school reform was under the jurisdiction not of politicians and businessmen (as recent reform has been), but driven by education professors and schoolteachers, as the Eight Year Study had been.

Finally, the complexity of theory and the continuing controversy concerning the 1970s paradigm shift—the reconceptualization—from a primarily programmatic field focused on curriculum development to an intellectually provocative interdisciplinary field focused on understanding, curriculum appears to have persuaded many to flee history and theory into ethnography. Apparently empirical, ethnography provides opportunities to study what teachers and students think and experience, functioning for some as opportunities for resistance to politician-driven school reform. At the same time, to the extent that it is atheoretical and ahistorical, ethnography functions as an anti-intellectual effort to bypass persisting controversies in the field regarding its present character and future.

One such controversy concerns the relationship between theory and practice, a controversy focused on the distance between university-based scholarship and teaching practices in schools. Given politicians' relocation of curriculum development away from curriculum professors and schoolteachers to arts-and-sciences scholars and now private corporations, it is unsurprising that the distance between university-based scholarship and school practices has increased. Because it claims to describe what occurs in schools, ethnography provides a means of bridging the divide between theory and practice. Often, however, ethnographic studies occlude theory by reproducing what is practiced, thereby contributing little to the intellectual advancement of the field.

Undermined externally by political priorities for school reform, then, and lacerated internally by identity politics and continuing controversies over the field's history and present character, curriculum studies faces an uncertain future, a fact not lost on scholars today. To address how external pressures (exacerbated by internal disarray and controversy) have impacted the institutional circumstances (universities' support for graduate programs in curriculum studies, courses taught, scholars hired, etc.) in which the field proceeds, the American Association for the Advancement of Curriculum Studies (AAACS)

has established a Commission on the Status of Curriculum Studies in the United States. Surveys will inform policy recommendations regarding the future of curriculum studies.

A second development that reflects anxiety over the future of curriculum studies is the establishment, also by the AAACS, of a Canon Project, an effort to identify key texts, scholars, and ideas in the history of the field. Although the ahistorical and atheoretical character of curriculum studies during the heyday of curriculum development was a key point in the paradigm shift of the 1970s, the field's tendency toward presentism has reasserted itself, in part due to external pressures and internal controversies. The AAACS Canon Project is an effort to influence the future of the field by establishing the main points of its past.

Aside from domestic (both internal and external) considerations, the future of U.S. curriculum studies will also be influenced by the extent to which scholars address issues raised by globalization. The events of September 11, 2001, intensified the dormant sense that U.S. scholars must attend to curricular developments worldwide. An international association was established; a U.S. affiliate formed the same year. Internationalization is not, however, primarily defensive, but cosmopolitan in character. Internationalization promises deepened understanding of the local and the individual through encounter with the global and the collective. Unlike economic and cultural globalization—often associated with U.S. cultural and economic expansionism—the internationalization of curriculum studies promises to intensify the self-critical intellectual sophistication of U.S. curriculum theory, especially that theory committed to multicultural, gendered, and political activism toward social justice and ecological sustainability. In that development lies the most promising future of curriculum studies.

## CURRICULUM STUDIES, THE FUTURE OF: ESSAY 5

---

Curriculum studies has emerged as a scholarly and practical field. It has moved away from the solely practical servitude to whatever school policy dictates. This positive feature garners more opportunity for the imaginative consideration of ideas since school policy has become so fully a function of support for governmental and business interests. The scholarly ethos of curriculum studies clearly keeps alive a refreshing orientation that seeks diverse possibilities in the spirit advocated by Maxine Greene, Alfred North Whitehead, W. E. B. Du Bois, John Dewey, Jane Addams, Paulo Freire, and many others. Such ideas are surely not without practical purport, and they are not subjugated by banal corporate interests. Sketched below are brief renditions of several directions for the future of curriculum studies: worthwhile pursuits, the big curriculum, curriculum of exile, literature and the arts, outside curricula, biography and autobiography, and creating good lives.

**Worthwhile Pursuits**

The common thread that strongly holds together diverse advocates of curriculum studies, and even provides common concern for the curriculum development era from which curriculum studies evolved, is focus on what is worthwhile. From time immemorial, educators have asked: What is worth knowing, needing, experiencing, doing, being, becoming, overcoming, contributing, and sharing? Interest groups have emerged to vehemently vie for leadership in

response to such questions, both within the curriculum field and in most societies at large throughout history. They have sought to determine the why, when, where, how, for whom, and in whose interest of the what considered worthwhile.

**Big Curriculum**

The big curriculum refers to the barrage of propaganda and public relations that perpetuates worldwide capitalistic and patriarchal efforts of Western corporate-governmental-military forces, providing a homogeneous culture throughout the world—that is, an imperial and neocolonial conquest that quashes indigenous cultures, languages, and even species in the interest of power, greed, and manifest destiny. It does this principally through advertising, mass media, patriotic admonitions, and many forms of schooling that instill values of an acquisitive society.

Throughout the last half of the 20th century and with greater fervor in the 21st century, a new form of world government has emerged in the form of multinational corporations. It is clear that they set the policies advocated by their appointed puppeteers known as national government leaders. A neoliberal current of cultural, political, economic, social, and personal values surges through the world with a new manifest destiny—namely, a message that everything, including the deepest of meanings, can be translated into commodities to be acquired. Such are the curricula perpetuated by militaries and mass media necessary, and study of them is vastly neglected. Instead, the attention of curriculum workers (scholarly and practical) is diverted toward fiddling with schools while the empire burns in service of personal and corporate greed. Reform of school curriculum is akin to rearrangement of the deck chairs on a sinking *Titanic*. Critique of acquisitiveness is clearly evident in work of Dewey, Michael Apple, Maxine Greene, Ivan Illich, Henry Giroux, William Ayers, Donald Macedo, William Pinar, Jean Anyon, Pauline Lipman, William Watkins, Joel Spring, Bernardo Gallegos, John Smyth, Peter McLaren, William Schubert, John Willinsky, Geoff Whitty, Gloria Ladson-Billings, Martin Carnoy, Paulo Freire, and others in curriculum studies and related areas. So is the criticism of key public intellectuals: Cornel West, Noam Chomsky, Ralph Nader, Jonathon

Kozol, Herb Kohl, Kurt Vonnegut, Howard Zinn, Gore Vidal, Molly Ivins, Edward Said, Wendell Berry, Annie Dillard, James Baldwin, Alexander Cockburn, Margaret Atwood, Phillip Lopate, and a host of others. Saddled with mandates from corporate government to cover prescribed curricula in schools and thereby to propagate interests of the wealthy, educators and students of the future are often moved to social justice by joining together to uncover the intent of curricular hegemony rather than merely follow mandates that harm all but the rich.

### Curriculum of Exile

The big curriculum forces many persons, even cultures and subcultures, into states of exile. Existence in between cultures, as Ming Fang He has illustrated in her narratives in between China and North America, places many immigrants into lives divided among allegiances, pushing toward her current emphasis on curriculum of exile. Clearly, those who move from one part of the world to another due to imposition of the big curriculum or because of goods, services, and opportunities denied in a once vibrant culture by the same big curricular forces, are in exile. They are not quite in a new culture, never fully accepted, and cannot return to the previous one. Similarly, within cultures, especially involuntary immigrants, such as slaves in the United States, or remnants of genocidal efforts, such as Native Americans, there is also a sense of exile from one subculture to another. Clearly, the choice of U.S. examples should not be taken as singling out the United States as the principal place of exile. Every country has an ample history of curriculum in between dominant and subjugated factions, colonizers and the colonized, oppressors and oppressed, exilers and the exiled, and in each set the former writes the histories and policies and the latter remains largely mute. In-between situations and states of exile provoke the development of what Watkins and his student Susan Berger have called clandestine curricula, curricula surreptitiously devised to meet needs of oppressed groups.

### Literature and the Arts

Literature and the full range of arts, including popular arts, music, and film, have long been sources that

exposed oppression. Likewise, they have been bastions of challenge and inspiration to oppose oppression. Not only are such curricula tailored progressively to meet individual needs and interests, but also they meet needs because they speak to a solidarity of human interests in birth and death, love and justice, goodness and salvation, beauty and ecstasy, freedom and opportunity. Orhan Pamuk, J. M. Coetzee, Toni Morrison, Gao Xingjian, Jose Saramago, Kenzbuero Oe, Wole Soyinka, Pablo Neruda, and Octavio Paz constitute a few of the voices from around the world that portray such interests.

### Outside Curricula

Interest of curricularists in varieties of public pedagogies are attempts to turn the public gaze toward curricula in unlikely spaces, places not usually identified as educational: homes and families, non-school organizations (clubs, churches, sports, community centers), mass media (videogames, the Internet, movies and film of all varieties, print materials including comics and popular magazines, books, television), peer groups (including gangs), multifarious relationships, vocations and avocations, and the cultures, languages, and communities they represent. Implicit and explicit, curricula within such places can be interpreted through lenses of curriculum studies.

### Biography and Autobiography

Curricular consequences can be seen holistically in portrayals of life worlds, biography, and autobiography. Curriculum scholarship has become and will continue to be more autobiographical and biographical—a telling of educational influence by the stories human beings have lived and are. Through multiple and narratives postmodern narratives, postmodern scholars search for the phenomenological core of meaning in personal and public life.

### Creating Good Lives

Returning to the initial point of continuing future focus on the historical legacy of what is deemed worthwhile invokes a focus on what it means to live good lives. It is not only the curriculum workers and educators, school based or not, it is most importantly the learners who can be kept alive and

enriched in meaningful growth by pursuing their natural interest in creating a good life for themselves. Long ago, Dewey, L. Thomas Hopkins, Harold Albery, and others urged educators to focus on central human interests by enabling learners to refashion themselves in relation to the world. If learners and teachers in every curriculum domain were encouraged to address how to live good lives, what that means, how it is a never-ending quest, and how it can contribute to fairness, love, and solidarity with other human beings and the surrounding world context, curriculum making would move toward democratization. Though one never becomes a fully functioning person nor arrives at participatory democracy, the journey is the curriculum that the future should create.

## CURRICULUM STUDIES, THE NATURE OF: ESSAY 1

---

The word *curriculum* can refer to a course of study as well as to a course of life. The *Oxford English Dictionary* (OED) defines curriculum as

both course and career—that is, a course of school or university study or a course of life or career as in curriculum vitae. As the field of curriculum has evolved, curriculum has come to be seen, at least in most school and government settings, as focused on the first part of the OED definition—that is, as a course of studies. However, many in the field of curriculum studies want to return to a more complex meaning of curriculum—that is, a view that allows us to direct attention to both a course of study and a course of life. Those who work within the philosophical tradition of John Dewey and his ideas of experience and Joseph Schwab’s ideas of curriculum commonplaces are among those who would see curriculum as more than a course of study. In this essay, I begin with Schwab’s curriculum commonplaces and use Dewey’s theory of experience to present one view of what counts as curriculum studies.

Schwab defined the curriculum commonplaces—that is, teacher, subject matter, milieu, and learner—as the factors that bound or delimit the aims, content, and methods of curriculum. Taken as a whole, they bound the statements identified as curricular. In any curriculum statement, all four of the commonplaces are necessarily present. The four commonplaces and their interactions define what is essentially curriculum within this conception of curriculum studies.

Working from the curriculum commonplaces as bounding what counts as curriculum allows us to understand the different ways that we can understand curriculum as both a course of study and a course of life. Such a view offers a window into understanding what curriculum scholars mean when they speak of the official or mandated curriculum, the intended or planned curriculum, the enacted curriculum as well as the experienced or lived curriculum. Within this view, we can also understand curriculum as null, hidden, and evaded. Following from this view, we can also attend to the relationships or interactions among the official, intended, enacted, and experienced curricula. Attending in this way allows those of us who work in schools with children, teachers, and families the possibility of engaging in the complex conversations of curriculum making.

Although researchers frequently adopt other curriculum commonplaces as the starting point for understanding curriculum, the commonplace of

teacher is central to understanding the curriculum that is constructed, enacted, and experienced in classrooms. Drawing on Dewey's theory of experience, we conceptualize a Deweyan view of curriculum from a teacher's vantage point. Dewey's notions of situation and experience allow us to imagine the teacher as a part of curriculum making and in so doing, to imagine a place for contexts and culture (Dewey's notion of interaction) and temporality (Dewey's notion of continuity). Working within a Dewey-inspired conception of curriculum, then, the teacher is not a kind of metaphoric conduit that delivers a curriculum mandated or planned elsewhere, but is an active agent in the ongoing composing and living out of the curriculum.

Within this conception of curriculum studies, teachers and students are seen to be living out a curriculum. Although intentionality, objectives, curriculum materials such as textbooks and content do play a part, the focus of curriculum studies is on the teachers' and students' lives composed over time. The teacher is an integral part of the curriculum in which teacher, learners, subject matter, and milieu are in dynamic interaction. Curriculum making is seen as a process in which teachers, children, and parents make or compose curriculum together in classrooms within nested milieus or contexts. Contexts, or milieus, can be understood as composing landscapes shaped by institutional, cultural, social, and linguistic plotlines composed over time. In this way, we understand power and authority as shaping the spaces between and among people, places, and things. Subject matter, too, is understood in more complex ways within this view of curriculum studies. Attending to curriculum in this way allows us to see particular children's and teachers' lives within particular milieus or contexts and in relation to particular subject matter. By entering into relationships with particular children, particular teachers, and particular parents, we understand the unfolding curriculum as a course of lives as people's lives are being lived out as well as a course of studies.

Understood within this tradition of curriculum studies, curriculum topics such as reform, implementation, development, resources, and materials can be understood from the starting point of different commonplaces and their interactions. For example, if we understand curriculum reform from

the starting point of teacher, we would understand reform in terms of how the teacher imagines or experiences the ways the reform agenda shapes her or his classroom context and her or his curriculum making with children. We can also understand curriculum reform as it shapes the mandated, planned, and experienced curriculum. For example, the influence of reform may be understood to shape the curriculum differently if one is attending to the mandated curriculum than if one is attending to the hidden curriculum, and so on.

Within this conception of curriculum studies, curriculum is seen as fluid, context-dependent, political, and moral both for the course of study and for the course of lives of children, teachers, families, and other members of society.

## CURRICULUM STUDIES, THE NATURE OF: ESSAY 2

---

When considering the nature of a field of study, I think most immediately about two of its key

constitutive components—knowledge and scholarship. A field of study is constituted of a dynamic body of knowledge that develops and changes to define the field and to represent it to and in the world. It is also constituted of an active scholarly enterprise that creates new knowledge that sustains the field and circulates that knowledge as meaningful within in broader contexts (including academic, sociopolitical, cultural, and practical contexts, for example). Knowledge and research are not mutually exclusive, but are rather interdependent. Together they inform, challenge, and inspire the field; they ensure the field as independent with its own identity and as distinct from other fields; and they further inform, challenge, and inspire practice. Both knowledge and scholarship are necessary to the existence of the field and to its viability in the world as a matter of importance, value, and worth.

The status of curriculum studies as a field of study in its own right is often challenged not only because it is viewed to be in its infancy (or youth by now) as a field of study, but also because it has had a contested existence. Conceptualizations of the field vary broadly in scope and significantly in perspective. The field of curriculum studies is often divided by an orientation to either philosophy or to practice, and these different perspectives are viewed as separate and conflicting. Questions such as is curriculum studies a philosophy, a set of knowledge or experiences, or a series of questions have recurred throughout time. However, the historical and current contested nature of the field is not important to explore in this essay. Regardless of the stance taken on the status of the field, the two key constitutive elements of knowledge and scholarship are sound and solidly ground curriculum as a field of study. As such, it is important to address the nature of curriculum studies. I have been inspired by the idea of curriculum as a field of study that turns imagination into reality (as developed by Elliot Eisner) and as a dance (as William Doll has discussed). Eisner refers to curriculum as a process where ideas are transformed by an act of educational imagination. Doll explains that curriculum is a critical, public, and communal process of experiential transformation that is based in dialogue and inquiry. These two views have reverberated in my academic and personal philosophy to inform my conceptualization of the

nature of curriculum studies in some form throughout my career. Therefore, I see knowledge and research in the field as largely shaped by these ideas. Over the last few years as the field of education has become embroiled in an overwhelmingly technocratic orientation (e.g., a testing regime, top-down bureaucratic control, and narrowing of curriculum), the conception of curriculum studies has suffered as well. Conversely, it is incredible that both Eisner and Doll use transformation in their framework for curriculum studies. For some time now, transformation in educational contexts has taken a backseat to technocratic ideas of control and standardization. Instead of falling into this narrow, limiting view of the nature of curriculum studies, it is important to hold to the idea of curriculum studies as a creative endeavor focused on turning imagination into reality (or more importantly and accurately for today's pluralistic and diverse contexts, turning imaginations into realities). Curriculum studies holds the potential to elevate education out of this quagmire that suppresses any ideas of transformation as central to the essence of the field.

What is important in this essay is to center curriculum studies as grounded in a conceptual, imaginative, and creative era (rather than an exclusive monopolizing technocratic, linear, sequential era) at both the philosophical and practical levels. This is of most critical importance as the world begins to recognize and struggle for some degree of balance between the romance of technology, science, and logic (which still matter, but not in a privileging sense) with the equally important need for creativities, big pictures, imaginations, and spontaneities, which are often shortchanged as relevant in a high-tech era. The plural linguistic forms used here, though possibly awkward, are important to honor the pluralities of the world and how they are not strictly numerical but are multiple in thinking, philosophy, and practice. Can the field of curriculum studies as characterized by ingenuity, creativity, story, design, and meaning making become first among equals within the technical era? What are the knowledge, research, and practical implications of a return to conceptualizing curriculum studies as turning imaginations into realities?

Reconsidering and recentering the energies of the field of curriculum studies has implications for

knowledge and scholarship. These are not new energies or new sensibilities for curriculum studies. In fact, they arguably represent the core of what curriculum studies has uniquely contributed as a field of study all along. In the future, this might well mean reconsidering and recentering curriculum studies in a movement to enliven education as a transformative endeavor that considers strongly the imagination of varied realities, dialogues, and inquiries as central to the future of the field if it is to have any merit in a changing society. The nature of curriculum studies is about transformation, design, and creation. These imaginative processes position curriculum studies to make significant contributions that are both conceptual and practical—that is, curriculum studies can influence ideologies and actual practice. It can lead a movement to recenter the ideas of transformation, design, and creation for better futures for everyone. Curriculum studies gives us the opportunity to create something new, something unexpected, and something transformative that changes the world. It gives curriculum scholars the license to consider how curriculum studies is connected to everything else and to the fundamental human experience. It allows us to alter the imprint of curriculum studies from a technocratic ideology to a humanistic one in which we look more holistically at education with an imaginative orientation such as a dance and use smart design sensibilities and to tell multiple stories about who we are. Curriculum studies has the credibility from its past to regenerate a new conversation that has the power to become contagious and that can change the world.

## CURRICULUM STUDIES, THE NATURE OF: ESSAY 3

---

Joseph Schwab's late 1960s' essay, "The Practical: A Language for Curriculum," generally is acknowledged as one of very few of the most prescient and significant contributions to the field of curriculum. Widely read then and now, this essay has gained laudatory attention even as it has suffered indignities of misunderstanding, dismissal, or bare acknowledgment. In his appraisal, he declared that the curriculum field at the time was moribund. Many readers, past and present, remember this negatively judgmental term as an adequate summary of Schwab's thesis. These naysayers appear to have missed the essence of his message. For example, Schwab cogently argued that the practical had or should have the pride of place in both the language of and work in the curriculum field. He also emphasized the centrality to curriculum decisions of several crucial particularities, and he asserted that deliberation was the methodology of the practical. Schwab's proposals were comprehensive, logical, and based in practice. They also remain largely unimplemented. These proposals continue to be discussed fruitfully, but they unfortunately exist primarily as an artifact of their times.

On the other hand, Schwab's ideas prompted the development of a small group of mainly young university curriculum scholars, designated as curriculum reconceptualists. They sought specifically to shift concern for practical elements of curriculum and to focus on curriculum theory, to lessen participation in curriculum development projects in schools, and to undertake mainly sociological and political research of contexts, power relationships, and concerns such as social justice, all critically relevant to understanding the engagement of diverse students with special curriculum elements. Theorizing without practical involvement in school curriculum activities became a central activity of their scholarship. Curriculum work, on the other hand, became marginalized as what curriculum practitioners did and something remote from the theorizing engaged by university scholars.

As one outcome of this development, this group of contemporary university curriculum scholars occupied that part of the original curriculum field previously populated by professors who engaged

to some extent in the real world of public school activities. Many of this new group of curriculum professors claim lineage from the 1930s' social reconstructionist thinkers whose professional pursuits focused on matters of educational philosophy, sociology, anthropology, and only tangentially, history. These professors accepted curriculum studies as the name of their academic specialization. In several instances, they joined faculty colleagues with specializations in social foundations of education in order to constitute a specialty area in curriculum and cultural studies.

This has led to a divide between school curriculum leaders and curriculum professors. Yet another group of professors especially concerned with the curriculum in schools has been developing robustly in departments of educational administration and policy studies in colleges of education. This third group of professors has grown rapidly, yet most ordinarily do not teach courses with curriculum in their title. Their offerings, however, focus on instructional policies, programs of study, curriculum leadership, program evaluation, staff development, and educational change. Most of these courses include field-based studies and focus on significant curriculum practices and theoretical nuances in the interplay of forces (e.g., race, gender, opportunity) that impact schooling in a changing U.S. society.

Consequently, a singular field of curriculum studies no longer exists even in assertion, except in memory and bibliography. Moreover, the earlier divide between school curriculum leaders and curriculum professors has become a massive chasm. As the same time, a number of departments of educational administration in colleges of education have insisted that their administrator certification and degree programs require increased attention to the school curriculum. This component, however, appears not to be taught by curriculum specialists from other program areas, further expanding and diluting any notion of a field of curriculum and leading to the subsequent popularity of the term curriculum studies as a replacement, not just a substitution for the term curriculum field.

Curriculum studies has become a field of university inquiries and courses separated and distant from the reality of curriculum(s) in the practical or real world of schooling. These studies commonly

contextualize the physical forms of the curricula used by students to interpret primarily in a social setting student engagements related to the studied curricula. Curriculum studies' remoteness from the everydayness and complexities of school practice and practitioners almost, but not quite, makes reasonable the university professors' depictions, analyses, and critiques of what they name as curriculum. Rather, university curriculum studies professors seem to be and frequently are too far away to yield critiques of school curricula in relation to their purposes, the realities of student engagements with curriculum. Most cannot see enough of the context of schooling at such distance, and thus they fail sufficiently to understand both what they see and what they miss seeing.

This characterization of the field of curriculum studies, admittedly, is idiosyncratic, too general, and overly simplistic. On the other hand, it emphasizes my belief that the curriculum studies field, asserted into existence some 30 to 40 years ago, helps to illuminate only a few aspects of curriculums that are employed in schools. On the other hand, much of this field's offerings provide too little assistance with which educators might increasingly brighten more of the field of practice such that the influence of actual curricula on students might be enhanced.

## CURRICULUM STUDIES, THE NATURE OF: ESSAY 4

---

Few fields in education are as welcoming yet bewildering as curriculum studies, and few academics are as self-conscious of their identity and

the nature and future directions of their field as those called curricularists. The constantly changing field has always been an area that challenged and baffled, and to describe its character remains primarily an act of normative discourse. Yet the nature of curriculum studies takes on different dimensions when viewed through its conference presentations. An analysis of over 18,000 American Educational Research Association (AERA) Division B and related division conference presentations, delivered between 1970 and 2008 (along with papers from other curriculum theory conferences), reveals a dramatic shift in what constitutes curriculum studies. Although conference presentations do not a field make, pronounced changes in the orientation and composition of research indicate a fundamental transformation in the field of curriculum studies.

Attending professional conferences in the early 1970s meant disseminating scholarship or learning of others' research activities. AERA Division B presentations were oriented toward the professional and specialized knowledge components of the curriculum field (to use Lawrence Cremin's configuration of professional, specialized, and general education knowledge components). Most sessions were conceived to further build upon the accumulated research of the field, and Division B members came to learn of new studies and practices that could be taken back to their host institutions and implemented and/or taught to others entering the field.

With the expansion of curriculum inquiry to include qualitative, autobiographical, and narrative forms of research, and with the dissatisfaction and to a certain degree the recognized hypocrisy of certain forms of quantitative inquiry, the field of curriculum studies in the late 1980s and early 1990s broke from the traditional confines of social science-oriented, educational research. This development completed the slow transition from a field of curriculum with its focus on program design and development, balancing the tension between theory and practice, to a field of curriculum studies with a broader conception of educational inquiry and with an increased allegiance to the humanities. Research involved much more than reports of innovative and successful school practices, and conference sessions no longer included exclusively professional and specialized knowledge. Presentations

began to represent the third component of Cremin's configuration—the general education component—taking form as personal–professional development. Topics became less practical and instead, reflected academics' exploration of knowledge, acts of discovery, and autobiographical reflections about the nature of learning. Conference sessions provided a venue for the expression of curriculum researchers' diverse and often unbridled interests with an unconditional acceptance of varied content areas, encouragement of personal narrative, and opportunities for self-expression as novelist, thespian, musician, or dancer. Few educational fields of study offered such freedom, and those in curriculum studies flourished with an increased academic-oriented and less school and practice-oriented focus.

Although some critics viewed these new dimensions of the field as a willing suspension of significance, the actual work of curriculum studies academics may not have changed substantially. Many were still involved in curriculum design and development in their administrative and teaching roles. A substantial portion of conference presentations indicate that the forums for curriculum development had extended beyond the K–12 school setting. Work was under way within post-secondary education, specifically curriculum development in teacher education programs and in broader cultural settings. Yet the academic pursuit of much research in curriculum studies was conceived as an opportunity for even more divergent forays into the realm of general education where researchers' interests pushed educational thought through postmodern domains.

Currently, curriculum studies seems adrift. A field of study cannot be defined primarily by individuals' assorted interests, as the trend seems to have become in more recent years. Interests are ever expanding, ever changing, and at times, self-indulgent. What has taken lesser importance recently has been curriculum's historic role in the area of professional knowledge. In past decades, the field of curriculum fulfilled a very important academic need—providing a distinctive interdisciplinary perspective for the many other communities in education. Curriculum professors addressed issues that crossed the traditional educational areas of administration, tests and measurement, evaluation, instruction, supervision, foundations,

and posed important questions for various constituencies that would not have necessarily arisen during conversations within these separate communities. Many curriculum texts of the past represent this synoptic role with a wide assortment of topics spreading across the entire field of education that served to integrate professional knowledge among the other subfields of education and to offer some continuity among the levels of schooling.

This integrative dimension of the field is now less prevalent and certainly more difficult to achieve with today's cultural fragmentation. And many curriculum scholars delight in exploring general education realms, traveling farther afield in more unfamiliar, exotic lands, and guided by interests that are no longer bound by professional or specialized knowledge. Yet perhaps now attention should be devoted to needs and the professional and specialized component of curriculum studies. To do so would pose what seems at times as superfluous traditional questions from the field: What should a curriculum studies person know, and what do other educators expect from the field? Is there some loose assortment of core knowledge in the broadest sense—issues, questions, modes of inquiry—that serve to help define and center the field of curriculum studies?

Others have been invited to discuss the future of curriculum studies. Their realm I wish not to tread; however, when curriculum studies continues to be defined primarily by individuals' interests, our field will have great difficulty in determining its focus. Curriculum studies remains innovative and experimental, and the importance of the general education component should not be dismissed. In fact, this adventurous quality of the field should be applauded. Attention to needs rather than interests, however, could offer balance for a field of study that continues to expand and change. Now is the time to correlate synthesis, breadth, and commonality and to forge interests with needs in a quest for significance in curriculum studies.

*Craig Kridel*

## CURRICULUM STUDIES, THE NATURE OF: ESSAY 5

---

There are many interpretations of curriculum. Understanding what curriculum is must be based upon how curriculum relates to education. Curriculum is the framework upon which all other educational decisions are made. Curriculum is the what of education. Curriculum answers the perennial question raised by Herbert Spencer in his essay, "What Knowledge Is Most Worth?" Finding the answer lies in the field of curriculum studies: the examination of factors influencing curriculum thinking, the principles that guide the development and design of curriculum, and the implementation and assessment of the curriculum. Curriculum studies is a constantly evolving field of research that reflects the latest knowledge in psychology, sociology, and technology, while firmly planted in philosophy and history. Because knowledge is constantly growing and changing, curriculum studies reflects those changes in its theories and practice. The curricularist (someone immersed in curriculum studies) is an avid student of the factors that affect decisions about what knowledge is most worth. Their expertise can guide the decisions made by people engaged in education in a rapidly changing world.

### Foundational Subjects of Curriculum Studies

There are five foundational subjects that inform curriculum theory and practice: philosophy, psychology, sociology, history, and technology.

#### *Philosophy*

Philosophy, the discipline upon which most educational programs are organized, influences decisions about the goals of education, the content to be selected, and the experiences and activities that are part of a person's educational experience. Philosophy determines the beginning, means, and ends of curriculum. According to John Goodlad, philosophy is the point at which all curriculum decisions are made.

Philosophies in the curriculum field fall on a continuum of very traditional to contemporary and conservative to liberal thinking; thus, curricularists

are faced with the difficulty of finding the middle ground within these beliefs that addresses content needs, student needs, and societal needs and that provide quality education for all students.

### *Psychology*

Psychology, one of the younger academic subjects, was established after Wilhelm Wundt opened the first laboratory dedicated to psychological research in Leipzig, in 1897. Psychology deals with how people learn and behave and is based primarily on physiology and neurosciences supplemented with knowledge of anthropology and sociology. The work of psychologists has influenced the understanding of behavior, cognitive development and intelligence, motivation, learning styles, and thinking skills. Psychology is evolving as more is understood about the nature of learners and human learning, much of this information provided through newer technologies that can determine how various parts of the brain function. Complex human beings are influenced by their innate abilities and their cultures. Understanding psychology helps the curricularists create educational experiences which nurture the potential of every student.

### *Sociology*

Sociology found its modern roots with the establishment of the Department of Sociology at the University of Chicago in 1892. Sociology is devoted to the study of human society, its organization, values, beliefs, and relationships of the groups within it. As societies become more complex, filled with many different voices expressing highly diverse ideas, schools struggle to find a curriculum that meets the diversity of the communities in which they are located. As behaviors of the larger society (e.g., violence, drug use, drinking, and corruption) penetrate the school environment, schools become change agents for themselves and society. Schools are viewed as the great equalizers with respect to race, class, gender, intellect, language, and handicapping issues. In this environment, curricularists understand that the school curriculum must prepare all students to meet the challenges of an unknown future by providing them with the skills to make wise decisions and to become lifelong learners.

### *History*

Understanding the past in order to function in the present and future is an important aspect of curriculum studies. Studying the history of education sheds light on events that influenced the development of and the need for curriculum studies. Curriculum studies developed its own methods, procedures, theories, and problem-solving techniques to understand the changes in knowledge and how that knowledge would impact education. Curricular ideas are tied to time and context of events. As the world changes, so will the questions change to which curricularists will seek answers.

### *Technology*

Technology's influence on curriculum studies is rapidly growing. Technology provides tools that allow more options for acquiring and sharing knowledge, of changing the nature of teaching, of providing excitement to learning, and of meeting more and different needs of all students. The tools of technology can bring the real world into the classroom; they can open the windows of cross-cultural communication, they can provide instant information, and they can create dialogues and discussions among all learners. They can help students share knowledge in exciting and dynamic ways. Curricularists study how new technologies enhance learning, the what, when, and how of learning. They can provide the guidance necessary to teachers and learners to ensure the appropriate use of technology in the teaching-learning environment.

## **New Times, New Challenges**

Well-trained curricularists with their knowledge of the five disciplines that impact what is learned in school can change the face of curriculum, teaching, and learning. Through constant analysis of new ideas and concepts from the foundational disciplines of curriculum studies and knowledge of past failures and successes, curricularists can make decisions that will maximize the learning potential of every student. Curricularists can help to find the balance of the growing opposing forces and positions in opinions and beliefs of what constitutes an appropriate education for all students; they can see the bigger picture and understand the consequences of limited vision on curricular decision

making. As the world becomes smaller and the challenges facing it greater, the curricularist will become an integral part of every educational institution. The future looks good.

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF EDUCATIONAL ADMINISTRATION

---

Historically, there was a relatively strong linkage between the fields of curriculum and educational administration. Although educational administration has always focused primarily on the education and at times the certification or licensure of superintendents, principals, and assistant principals, the field also has educated individuals who play curriculum-related roles within school districts (e.g., director of curriculum and assistant superintendent for curriculum and instruction) and who play a range of curriculum-related policy roles in government.

Within the academic realm, there also was a close relationship between the two fields in the first half of the 20th century. During that time, in fact, curriculum courses normally were embedded within educational administration programs. In addition, curriculum was viewed primarily as a document that prescribed what should happen in the classroom to produce desired results; consequently, virtually everyone assumed that school administrators

needed to understand how to make a curriculum and to understand the basic principles of curriculum and instruction. *How to Make a Curriculum* is a book by Franklin Bobbitt, and *Basic Principles of Curriculum and Instruction* is a book by Ralph Tyler. Invariably one or both of these books were used in administrator preparation programs throughout much of the 20th century.

In the century's final decades, however, a new breed of curriculum scholars challenged what they referred to, pejoratively, as the Tyler Rationale, and curriculum studies, in essence, became a separate and radically different field than educational administration.

Although researchers in the educational administration field continued to focus their research on issues such as the effects of different school structures on such things as school climate and student learning, school effectiveness and its correlates, and the impact of school leadership on student achievement (as measured by standardized test scores), scholars such as William Pinar and Madeleine Grumet were reconceptualizing curriculum studies in radically different ways. Among other things, the reconceptualist movement attempted to strip the concept of curriculum of its institutional associations. The institutional, curriculum-as-document view was replaced by a conception of curriculum that equated the concept of curriculum with a highly personal—but also, somewhat paradoxically, a highly theoretical—search for personal meaning.

Another line of criticism came from self-described neo-Marxist curriculum scholars such as Michael Apple. Rather than challenging institution-based views of curriculum and embracing philosophical schools of thought such as existentialism and phenomenology, as Pinar and Grumet did, neo-Marxist scholars embraced critical theory and a macroview of institutions. This view assumed that school curricula—including those things that were taught informally through the way schools were structured—that is, the so-called hidden curriculum—were one of the vehicles that helped the larger society reproduce itself and, in the process, keep the powerful privileged and those at the opposite end of the empowered-disempowered continuum poor and disadvantaged.

Interestingly, the field of educational administration was experiencing its own theory movement

at approximately the same time that curriculum scholars were embracing theory. What educational administration scholars meant by theory, however, was quite different from what curriculum scholars meant. Although curriculum scholars looked to the humanities and European social thought for inspiration and guidance, educational administration scholars attempted to generate the sort of empirically tested social science theory that promised to provide the sort of institutional control that the new breed of curriculum scholars railed against.

One consequence of educational administration's social science theory orientation is that the field remained narrowly focused on improving school practice even as the newly independent field of curriculum focused on such things as self-development and societal critique. Indeed, educational administration's theory movement failed, at least in part, because social science theory—which is, by definition, general and always about ideal types rather than about actual schools—was never capable of providing the sort of detailed game plan for improving individual schools that theory movement advocates had promised.

The theory movement also was undermined by critiques of the movement's control orientation by educational administration scholars such as Canadian Thomas Greenfield (whose writings echoed the work of curriculum scholars Pinar and Grumet) and Australian critical theorist Richard Bates (whose thinking bore a strong family resemblance to the thinking of neo-Marxist curriculum scholars such as Apple). Greenfield's and especially Bates's influence can still be seen in contemporary scholarship and teaching in the educational administration field. Much of the field, however, remains focused on what schools and more specifically, school leaders must do to improve test scores that supposedly measure student learning.

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF EDUCATIONAL FOUNDATIONS

---

If one were to consider the intellectual genealogy of curriculum studies and social foundations of education, one could assert that they had many common ancestors. Both are in part descendents of politically and socially progressive early 20th-century thinkers and social reformers who were responding to the social, economic, and cultural contexts of the times. And finally both emerged from a strong, optimistic, and widely held belief that education could make the world better for a wider group of people. Although there was and continues to be a vibrant common area of overlap, the fields also evolved into separate entities.

The identity of social foundations of education has been characterized by a plurality since its birth. On the one hand, there were the cross-disciplinarians who were concerned with studying and writing about education for the purposes of bringing about social, cultural, and economic changes that would benefit the masses. There was and continues to be an equally strong strand comprised of scholars located firmly within the disciplines of history of education, comparative education, sociology of education, and philosophy of education. At its inception, educational psychology was also considered a part of educational foundations, but it eventually separated into its own field.

One of the major differences between social foundations and curriculum studies is related to the scope of the research agenda of each field. The area of social foundation is in part focused on study of the relationship between society and education. Part of this could overlap with curriculum studies in the sense that the curriculum broadly

defined could have great impact on the culture and politics of the society that it serves. The relationship between schools and society is reciprocal—that is, society also influences education. This influence can be seen recently in the emergence of the No Child Left Behind legislation, the increased use of standardized testing, and the political context since the 1990s. Thus social foundations is focused on the social and cultural contexts of education and on the impact of education on social and cultural forms.

Curriculum studies could be a component of both of these issues, but social foundations research scope is much broader. For example social foundations research could encompass the history of high schools in the Southwest without touching on curricular issues. In fact, there are a variety of social foundations topics that do not contain the study of curriculum. One could, for example, study the relationship between 4-year universities and quality of life in the country of Uganda. This research would be in the social foundations area of comparative education.

The research in the area of social foundations could be either quantitative or qualitative or interpretive, whereas research in the area of curriculum studies tends to be qualitative, interpretive, or autobiographical. There is a strand within the field of social foundations that is well connected with the area of curriculum studies. George Counts, *Dare the School Build a New Social Order?* written in the 1930s, was characteristic of the optimism that permeated particular strands of the teacher education movement in the 1940s, which were pioneers of both fields and began to chart a path for progressive educators seeking to devote their professional energies to making the world a better place for more people. It was at that point at Teachers College that the Foundations Idea was started by a handful of scholars including those mentioned above who were intent on utilizing their positions as professional educators to bring about a world that was more humane, and more comfortable for the masses of the people who were living lives of economic and cultural marginalization. In a recollection of the times, R. F. Butts, one of the early directors of the Social Foundations Program at Teachers College, asserted that the one thing they all had in common was that they were for the underdog, they were international, and

they wanted to change the world. Later, the group would be strengthened by the emergence of Maxine Greene, also at Teachers College, who was to become greatly important to both the areas of curriculum studies and to social foundations of education.

A major development that impacted social foundations of education and curriculum studies was the emergence of postmodern and poststructural analysis across the disciplines. Although there were many scholars that championed this movement, one of them, Michel Foucault, wrote prolifically about the nature of power and the relationship between knowledge and power. The advent of modernity ushered in what is now known as Western metanarrative of the progress of the human race. More specifically, human beings are on a trajectory toward progress and away from backwardness. Postmodern theorists in both social foundations of education and curriculum studies have critiqued the dominance of the metanarrative by calling into question the ethnocentricism embedded in the notion that modernity emerged in the West and therefore places the West in the position of leading the progression. The entry in to the fields of social foundations of education and curriculum studies of several scholars of color as well as other critical scholars has reshaped the direction of the fields.

As social institutions, schools support particular interests; therefore, only one of the stories above will likely be championed as legitimate knowledge. The power–knowledge relationship, then, takes on immeasurable importance when thinking about the lives of educators. Much recent social foundations scholarship engages the nature of knowledge and its sociocultural origins. Central to this is examining the politics of knowledge, or more simply put, whose interests are being served by any particular narrative or curriculum, and whose interests are being marginalized.

Among the greatest contributions from both curriculum studies and social foundations scholars who locate themselves within postmodern analysis is the rescue of imagination and curiosity. Often when discussing education, students tend to create a border between what is possible, or how they can imagine the world, and what they refer to as the real world. “This sounds great, but in the real world . . .” They speak as if there was some sort of

fixed reality out there, separate from the theorizing and imagining they do that is somehow not real.

The idea of a world (real) with fixed meanings, where one can know something only because it is written in a book somewhere or where one cannot own a perception because it might be a misperception, is a concept that foundations and curriculum studies scholars critique. The emergence of post-modern interpretation has directed the focus of foundations and curriculum studies scholars to the ambiguity of meaning and thus has rescued many scholars from the anxiety and pain of feeling forced to speak and write in somebody else's voice. Imagination, surprise, curiosity, discovery, and ambiguity are alive and well in the classrooms of some social foundations and so are curriculum studies professors who refuse to believe that we can ever fully know the world. Social foundations and curriculum studies educators and students are able to revel in the passion of exploring the multiplicity of worlds that we inhabit and that inhabit us. They teach for the world as it could be and are not disabled by the so-called real world that itself is imagined and thus imaginary.

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF EDUCATIONAL HISTORY

---

The link between curriculum studies and educational history is to be found in the emergence of the field of curriculum history. In the late 1960s

and early 1970s, curriculum history came into its own as a distinct area of inquiry within the field of curriculum studies with such disciplinary trappings as a complement of identifiable practitioners, an array of investigatory methods, and a more or less shared research agenda. Arriving on the scene when it did, curriculum history developed at the time that a number of educational historians were involved in a revisionist movement for reinterpreting the nature and purpose of their discipline. And it was the conflict surrounding revisionism that became the defining issue among those scholars who shaped the study of curriculum history.

Because of the close association of curriculum history to educational history, it is not always easy to differentiate the issues that distinguish these two fields. There is much in the way of overlap in the topics that educational historians and curriculum historians explore. They both, for example, are interested in the development over time of the course of study. What does seem, however, to distinguish these two groups of scholars is the focus that curriculum historians accord to the development of curriculum as a professional field of study. This is not an issue that has attracted much attention on the part of educational historians.

Key to the revisionist effort in educational history was the question of the regulative role of the school—that is, was the U.S. public school an instrument for advancing democracy and opportunity? Or was the school an instrument of social control for enhancing the power and privilege of the nation's elite? For much of the 20th century and now into the 21st, this has been a question that has engendered conflict among educational historians. Central to their work on this subject was the role over time that schools have played in an ongoing conflict that they saw between the aspirations of racial and ethnic minorities and the working class on one side and the interests of the White middle and upper classes on the other.

As a group of scholars, curriculum historians are largely divided between those who view the curriculum as a means for realizing democracy and opportunity and those who challenge this celebratory account of the development of the curriculum. This latter group has been generally sympathetic to the revisionist view of schools as instruments of social control for reproducing existing social class

relationships. They share the revisionist criticism of curriculum differentiation as a means of channeling the children of the rich and poor to different courses of study and ultimately to different and unequal life destinies. Yet they question the totality of the resulting regulation. They reject the view of the most radical revisionist educational historians that minorities and the working classes simply acquiesced in the directions that elites have set for them through the schools. Instead, they have defined a more balanced position that recognized the patterns of both conflict and consensus that have defined the development of the U.S. curriculum.

At the outset, the focus of attention for curriculum historians was on the development of curriculum ideas and proposals. It was in effect an intellectual history of the recommendations for what the schools should teach that had been advanced by leading educators and national committees. Yet in recent years curriculum history has been affected by the shift within the discipline of educational history from intellectual to social history. There is today a growing movement among curriculum historians for using case studies to explore the development of curriculum practice in actual school settings.

It is difficult to say what impact this link between curriculum history and educational history has had on the field of curriculum studies. It is important to note in this regard that curriculum studies during the late 1960s and early 1970s was undergoing its own transition as a result of the growing popularity among its practitioners of qualitative research. This was a shift that brought into the field the same concerns about the role of schools as instruments of social control that has defined curriculum history as a discipline. Yet it is also the case that curriculum studies scholars often seek to situate their research in a historical context and find that context in the work of curriculum historians who use the substantive and methodological insights of educational history.

It has not simply been the case that the relationship between educational history and curriculum studies has been one directional. As a discipline educational history has not been particularly receptive to the work of postmodern scholarship. It has largely been the work of curriculum scholars whose research and writing addresses historical themes who have taken the lead in introducing

postmodern ideas and methods into the research agenda of educational history.

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF EDUCATIONAL POLICY

---

*Educational policy* frequently impacts the school curriculum, either directly or indirectly, and consequently, should be a major concern of scholars in curriculum studies. The term educational policy refers to the rules and regulations that direct and govern schools, higher education institutions, and other organizations, programs, and initiatives that consciously promote learning. Policies normally are explicitly articulated and formally established; sometimes, however, the norms and standard operating procedures of organizational culture can function as quasi-policies and make formal policies unnecessary.

Although policies can be written more as suggestions than directives, a policy also can spell out significant consequences for complying or failing

to comply with policy mandates. A recent example of an educational policy that stipulates negative consequences is the No Child Left Behind Act enacted by the United States government.

Policy making is often equated with governmental action, and indeed, in the United States, some of the most important educational policies are made by school boards, state governments, and increasingly, federal officials. In other countries with more centralized governance structures (and national curriculums), the national government is the primary actor in the policy making arena.

Governmental officials are not the only people who make educational policy, however. Because all groups need at least informal policies to operate, even teachers, who are not normally thought of as policy makers, must develop policies to manage their classrooms. Research suggests that some of these policies (e.g., the policies teachers establish to form small instructional groups in their classes) are among the most significant for promoting—and inhibiting—student learning.

The field of educational policy making is more difficult to define—or even find. To be sure, in recent years the American Educational Research Association established a division called Educational Policy and Politics, but the association members who are most influential in the governmental policy-making process often are not affiliated with the division. In universities, educational policy programs sometimes are subsumed under—and at times indistinguishable from—educational administration programs; in addition, students getting degrees in public policy, public administration, political science, and economics can specialize in education policy and policy making.

To further complicate matters, in recent years some educational foundations programs (i.e., programs whose faculty focus their teaching and scholarship on discipline-based subjects such as educational history and educational philosophy) have rebranded themselves as policy studies programs. In other education colleges, the educational policy label has been affixed to some of the large departmental amalgams created by consolidation initiatives. These departments house a variety of education specializations (including, at times, curriculum studies); some of the specializations are, at best, only peripherally related to educational

policy and policy making as these terms normally are defined.

It would be reasonable to assume that most curriculum scholars would be interested in educational policy and that some would be influential in governmental policy making. For the most part, however, curriculum and policy scholars have inhabited separate universes. This separation did not occur accidentally. William Pinar and Madeleine Grumet, for example, explicitly argued that scholars in a reconceptualized curriculum field should, at least initially, ignore policy making and focus their attention on more abstract theorizing. This explicit rejection of policy work is hardly surprising because policy is designed to control and manage situations, and most of those who reconceptualized curriculum studies in the final decades of the 20th century were suspicious of all forms of social control.

In recent years, curriculum scholars have expressed a bit more interest in policy and policy making. Even Pinar devoted substantial space in his synoptic text on the curriculum studies field to the work of policy scholar Richard Elmore. Undoubtedly, the perceived negative impact of the No Child Left Behind legislation on the lives of students and teachers—and on the school curriculum—has been one impetus for curriculum scholars such as David Flinders to speak out on policy-related issues.

The challenge for curriculum scholars who want to influence governmental policy making is to find ways to effectively communicate with the policy community. Even policy analysts within the academy often work from very different bibliographies than curriculum scholars employ. Many policy analysts, for instance, may not be well versed in European social theory; they may, however, invariably be well schooled in the cost-benefit thinking of economists. The unanswered question at this point is the following: Can curriculum scholars translate the curriculum studies fields' key ideas into a language that policy analysts and policy makers will understand without losing too much in the translation?

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF INSTRUCTION

---

Conversations that link curriculum and instruction are as old as the institutions that educate students. Decisions about what to teach have implications for how to teach. The origin of the notion of instruction as a production system can be traced to efforts during the early decades of the 20th century to apply industrial scientific management to education. In later years, instruction as a production system was related to the doctrine of behaviorism and to systems analysis and accountability. By mid century, with focus on accountability, evaluation became a central practice in the field of instruction and in the practice of curriculum development. Ralph W. Tyler, perhaps one of the most influential educators in evaluation, influenced policy and set guidelines for the expenditure of government funds. His work helped to codify educational evaluation as it pertained to aligning measurement and testing with specific educational purposes. By this time it was customary for scholars and practitioners to consider curriculum as a design problem. The well-known Tyler Rationale was articulated in *Basic Principles of Curriculum and Instruction* as the way to consolidate parameters for analysis of the internal components of curriculum construction—goals, implementation, and evaluation. Curriculum planners were guided to consider a curriculum program that consisted of purposes, learning experiences, organization and evaluation. Program evaluation, then, was intended to determine the effective aspects of the program and to revise the areas that were not

effective. In his book, Tyler described learning as taking place through the action of the student, not what the teacher does.

By the late 1960s, the fields of curriculum and instruction had fused in the guise of the objectives movement. With the large-scale entry of the federal government, first through the 1958 National Defense Education Act, the National Science Foundation, and subsequently by the Elementary and Secondary Education Act of 1965, government linked with private funding sources to forge a powerful force in curriculum and instruction policy. The economic force effectively overshadowed individual child-centered education. The demands of the funding agencies for accountability influenced the emphasis on standardized treatments and evaluation. The dominant camp of curriculum scholars was representative of evaluators such as W. James Popham, who worked from a means–end perspective that required curriculum developers to clearly state objectives of a program prior to deciding its content and organization. Under their influence, in the 1970s thousands of U.S. teachers learned to write behavioral objectives using standardized and tightly controlled formats. The practice continues today as it serves the growing trend toward standardized achievement testing that has given impetus to conceiving curriculum in terms of test results.

By the decade of the 1970s, the voices of curriculum scholars whose work followed different scholarly perspectives began to be heard. Curriculum development as the prime focus had lost dominance. Federal monies were running out and the evaluators were leaving the curriculum field. Writing behavioral objectives had become the centrality of curriculum development and instructional design for at least two decades. However, as the reconceptualist movement matured, the two practices began to identify as different fields. These curriculum scholars had become the dominant force in the American Educational Research Association's Division B Curriculum and Objectives. In 1982, Elliot Eisner was the head of the curriculum division and oversaw the proposal to change the name of Division B to Curriculum Studies. This change was a clear signal that the field of curriculum studies had severed its relationship to both curriculum development and instructional design.

Today instructional design is a prominent practice in education that is viewed as an efficient way to deliver certain types of training. Computer applications in education are rapidly advancing in the field of instructional design and are becoming a major influence in innovative ways of delivering instruction. As a result of the technological assumptions and imperatives for practice that are now associated with instruction, curriculum scholars have produced a body of criticism to challenge the dominant technological view that influences both teaching scholarship and instructional design.

Curriculum scholars are troubled by the newer instructional technology and the growing trend toward standardized achievement testing that have given impetus to conceiving curriculum in terms of test results. With schools and teachers being evaluated according to student scores on standardized tests, there has been an increasing tendency for teachers to teach to the test. Hence, the test not only provides the quantitative data on the outcomes of instruction, but also exerts a powerful influence on instructional processes and very largely determines the curriculum. In effect, the curriculum is seen as the quantitatively measured outcomes of instruction. To curriculum scholars, such a conception of curriculum reduces the schooling process itself to a technological system of production.

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF SUPERVISION

---

Curriculum studies and the field of supervision have been influenced by two somewhat complementary enterprises: bureaucracy and professionalism. In education bureaucratic needs are focused on political, practical, and efficient patterns for organizing and maintaining effective institutions. Professional needs are concerned with knowledge and experience that can ensure qualified (and in most cases, licensed) workers. A third enterprise is scholarship, the work of academics in creating new knowledge associated with the needs of the other two.

In the 1890s, supervision was cast within a bureaucratic organizational framework of administration. Supervisors as administrators paid little attention to curriculum making. Administrators concerned themselves with the new political demands associated with organizing and running their schools. Curriculum and supervision seemed to have been on paths that signaled two separate evolutionary fields. And although there have been repeated calls by scholars and practitioners to recognize the importance of viewing the two as integral partners in providing effective learning experiences for students, major forces have continued in different directions. There have been, however, periods of connection that reinforced the notion that teaching can be enhanced with the cooperative engagement of teachers, curriculum workers, and supervisors.

Curriculum scholars have speculated about the origins of curriculum as a field of study. Hollis L. Caswell, prominent professor at Teachers College who organized the new Department of Curriculum and Teaching in 1938, suggested that curriculum has been a subject of study and innovation since the beginning of organized education. Others have argued that the Herbartian movement in the late 1890s was a defining effort. However, Lawrence Cremin, educational historian and former president of Teachers College, posited that although the roots of curriculum date back to the late 19th century, curriculum did not emerge as a distinct field of study until the widely publicized program of

curriculum revision was introduced in the Denver school system in 1922. It was the superintendent who implemented an initiative in which classroom teachers participated significantly in a systemwide effort at reform. At that time, in most of the country, curriculum development was minimal and episodic. In urban districts, the supervisor's duty was to carry out the rigid and fixed courses of study determined by the superintendent. Both supervision and curriculum were under administrative structure. And although curriculum issues were the concerns of educators interested in philosophic challenges, school people were chiefly interested in structural, administrative reform to achieve their goal of standardization and uniformity, especially in large districts. Once the administrative innovation of systemwide curriculum development in both the Denver and Detroit schools caught on nationally, it became apparent that educators other than the superintendent would be needed to manage the process. It was training such curriculum specialists that provided a benchmark effort in the history of the field.

In 1926, the publication of two volumes by the National Society for the Study of Education contributed to the increased interests in curriculum across the country. Harold Rugg and George Counts, in a discussion of the current methods of curriculum making, suggested that a nationwide movement was under way and the time for curriculum revision had arrived. The publication strongly advocated for competent and knowledgeable professional curriculum specialists. In the last half of the 20th century, curriculum planning and development grew steadily, achieved wide popularity, and was perceived as useful in reconstructing courses of study. Education in curriculum studies through academic coursework was viewed as necessary and curriculum development as a professional enterprise became legitimate.

After 1900, in the field of supervision, urbanization intensified and the school systems grew more complex. The superintendent, as central office administrator, often lost contact with the day-to-day operations of the individual schools in the district and had to establish certain administrative and supervisory positions. Principals, general supervisors (later assistant principals), and department heads assumed responsibility for the oversight of the schools. Supervisors, seeking

professional status, attempted to disassociate themselves from bureaucratic and production-oriented role relationships. As a result, the scholarship emphasized democratic and cooperative supervision. And although educators in both curriculum and supervision drew from different professional discourses and scholarship, both fields were influenced by the writings of John Dewey.

For a good part of the 20th century, the interests of supervisors and curriculum workers remained disparate. Curriculum workers paid little attention in their practice and scholarship to administrative and supervisory aspects that facilitate curriculum theory. Supervisors seemed to neglect problems concerning curriculum. There were, however, attempts in various areas to develop collaborative efforts between curriculum workers and supervisors. An increasing number of educators began to realize that the image of the supervisor as an inspector with "super vision" could dramatically improve if the supervisor worked cooperatively with teachers and other school personnel. Furthermore, because a major function of supervision was to attend to the improvement of instruction, facilitating curriculum development with groups of teachers could help this effort. Educators were recognizing the necessary relationship between curriculum and supervision. The founding of ASCD (Association for Supervision and Curriculum Development) in 1943 reflected the belief by practitioners and scholars that a unified effort between supervisors and curriculum workers was needed to successfully carry out the instructional aspects of schooling and for a few decades the functions within the practice and scholarship of supervision included curriculum development as a way to improve instruction.

By the 1990s, however, the estrangement between curriculum studies and the field of supervision widened. Supervisors often had limited knowledge of curriculum discourses and focused instead on the technical skills of teaching in general. The implications of this estrangement were even more apparent in scholarship in the two fields as supervision became increasingly associated with more technical, administrative issues, and curriculum studies became more theoretical. In curriculum scholarship, a major question is to ask what knowledge is of most worth. In supervision research a fundamental question is to ask what are best

practices and how can we foster improvement of instruction.

In the dawn of the 21st century, major state and federal mandates are radically changing both fields. High-stakes testing has forced administrators to concentrate their practice on accountability through test scores. Curriculum work has focused on student achievement and state standards that must be aligned with testing. School districts often purchase curriculum packages from educational entrepreneurs. Large-scale technology and massive data management demands the attention of supervisors and curriculum workers. As a result both fields may find new ways to collaborate for the challenges of the new century.

## CURRICULUM STUDIES IN RELATION TO THE FIELD OF TEACHER EDUCATION

---

Rather than work in a single discipline, faculty in professional schools, including education, work within a problem that is of compelling interest to stake holders. The contextual parameters within which professional schools operate shape the nature of the curriculum work done within them. In law schools, for example, the bar examination

and the importance to school prestige of graduate passing rates and employment directly influence decisions made about course content, purposes, and pedagogy. When graduates do not do well on a portion of the examination, consideration will be given to changing the courses and instruction associated with that set of topics. Candidate testing also is an important part of teacher education. Academic and verbal skills, content area, and pedagogical knowledge are tested and the results influence course and program design. Similarly, satisfying accreditation standards for professional schools plays an important role in curriculum studies. Representing accepted professional practice, meeting these standards dramatically affects the nature of the curriculum. Ensuring continuing accreditation necessitates ongoing analysis of student performance in relationship to curricular offerings. When deficiencies are noted, program revisions follow.

Within teacher education, in addition to students, arts and science, education, and school faculties, including administrators, and various levels of policy makers are heavily invested in program development and revision. There is a fundamental tension running throughout much of this work: on one hand, the charge is to educate individuals who fit into and can with relative ease work effectively within schools as they currently operate; on the other, is the intent to educate educators who are able and positively disposed to involvement in system change and improvement. The importance of this later concern is evident in teacher education programs oriented toward social justice, inquiry, and multicultural aims, where the expectation is that teachers can, do, and must influence positively the wider society, making it more just and compassionate. Accrediting bodies have embraced both charges.

In addition, professional schools are deeply concerned with questions of identity and membership. Upon graduation, the expectation is that the graduate will be prepared for a vocation and possess the dispositions and modes of thinking characteristic of the profession. Proof comes in the form of a license or certificate granting the right to practice. Identity is less an outcome of courses than of the entire professional experience and as such, is part of the informal or hidden curriculum. Nevertheless, it is an important outcome strongly

related to professional commitment—to those who actually engage in the practice successfully.

Finally, like theology schools that prepare ministers, education schools are necessarily deeply concerned about the kind of people who enter teaching. As a moral relationship, teaching not only sets the terms by which young people encounter the disciplines, but also provides standards of human kindness, caring, and decency.

Although the general problem that defines teacher education is how best to educate outstanding teachers, several related questions engage curriculum scholars. A few of these follow: The politics of teacher education, how decisions are made, who exercises influence and how, and how best to productively bring together the various stakeholders is an ongoing concern and research interest. Energy has been and is being directed toward identifying promising teaching practices for inclusion in the curriculum, especially for urban and minority children. Developing and refining models of assessment that fairly and accurately represent teacher impact on learning is of growing interest. The formation and sustaining of university–school partnerships remains a lively topic. New models of mentoring and forms of teacher collaboration are being developed and tested as are new patterns of field experience, including student teaching. Teacher beliefs and their impact on practice are a major focus of inquiry. Interest grows in teaching and technology and in the generation of new kinds of interactive materials. Questions of teacher development, life narratives, identity, and emotions are of growing consequence to curriculum scholars. Increasingly, individual teacher educators study their own practice, seeking improvement. Local program studies are gaining in influence. Work continues and grows in the various disciplines to gain insight into how they can better be taught and learned. Finally, curricular design work garners attention as teacher educators continue to seek to create content and course sequences, including between time spent in field studies and on campus, that better facilitate beginning teacher learning and development.

## CURRICULUM STUDIES IN RELATION TO THE SOCIAL CONTEXT OF EDUCATION

---

Curriculum studies employs the social context of education to understand the tensions between the social sciences and the psychological, measurement sciences. Heretofore, in the earliest beginnings of the curriculum field, scientific management and psychological sciences predominated curriculum with a behavioral approach that categorized and structured hierarchies of student ability and aptitude, generated from a worldview that elevated measurement and testing as the ultimate determinant. Yet from the time George Herbert Mead's work influenced John Dewey, the recognition that students did not live in social vacuums, and therefore research on the child, society, and its institutions to illuminate societal issues and their impact on student academic work, existed in relative obscurity in educational research and was in a constant struggle for legitimacy.

The social context of education, as conceptualized by the American Educational Research Association Division G, formally recognized the need to employ social sciences in educational research. Curricularists embrace these same nonpsychological social sciences—sociology, urbanology, anthropology, political science, and social psychology—to help unpack society and its implications for curriculum organization and classroom practices. However, even after Division G's 1968 beginnings, the social issues that impact inequity of wealth and educational opportunity still exist.

The social context of education confirms that the curriculum field is a conflicted and contested terrain. At the national level, No Child Left

Behind (NCLB) education legislation has become a scientific and evidenced-based school policy mechanism, which many believe has reduced curriculum organization to the mantra “pass the test.” This revitalized behavioral approach using performance objectives and systems management results in curriculum differentiation for middle-class and urban and rural working-class students. NCLB’s high-stakes testing instituted mandatory student assessment. The penalties for low performance came in the form of vouchers and tax credits to attend better performing schools, including private and parochial, with the potential of destroying public education.

Another not unrelated layer of complexity is corporate interest. A century ago, industry demanded a curriculum that would develop a workforce to allow businesses to compete in world markets. Now corporations are in the business of education on national and global levels. Curriculum development and assessment is big business: educational television; attempts to privatize public schools; the testing industry, especially in light of NCLB; and corporations (such as Plato) market curriculum software in Europe; have distributors in the middle East, South Africa, and Singapore and are looking for new potential markets in Asia; and other English-speaking countries. Social context helps curricularists ask questions about such corporate interests and national policies.

The social context of education helps us understand that curriculum is profoundly political. The knowledge disseminated in schools is not neutral because society, and even science itself, is not neutral. The social tension is, in part, because those who have accumulated wealth, power, and privilege try to maintain their advantage, while those having less and in many cases, much less, struggle to change the rules so that they can acquire a better life for themselves and their children. In a democracy, citizens would have equal access to education, health care, a clean environment, and so on, but in a republic, some are more equal than others. The essential role of curriculum is a course of study to prepare subsequent generations for lifelong learning, the adult world of work, and, it is hoped, for a fulfilled social and personal life as a member of the global community. Yet there are those who are woefully unprepared to join the adult world of work, much less be a citizen of the

world. Studying social context allows curricularists to investigate why society operates in sometimes curious and unexpected ways. After all, electing Barack Obama, the first man of African descent to be U.S. president is revolutionary. Ironically, however, curriculum organization has taken a backseat to the standards, outcomes, and accountability regime. The results are a Sneddenistic type differentiated instruction—discipline-centered reform for the most able students and basic instruction for the least able students, which speaks volumes about their future adult opportunities. How does this curriculum configuration historically manage to replicate itself so accurately, precisely, and consistently over the years? In these contemporary times, employing social sciences to inform curriculum studies could illuminate new occasions for changing current configurations, with an eye toward the moral, ethical, and sane advancement of a global community. Will curricularists work to change the current education trajectory as learned from the lessons of the past? Time will tell.

## CURRICULUM THEORIZING

---

*Curriculum Theorizing: The Reconceptualists*, a collection of essays edited by William F. Pinar, is the initial work in reconceptualization’s break with the traditional field of curriculum development. The field had been dominated up to that point by the Tylerian paradigm (1950–1970). This traditional Tylerian paradigm consisted of work in curriculum development, design, implementation,

and evaluation. The work of the scholars included in the collection was an attempt to raise issues, problems, and questions about the dominant paradigm in curriculum. Major scholars in the curriculum field of that period were included in the text. James B. Macdonald, Lawrence Cremin, Herbert M. Kliebard, Michael Apple, John Steven Mann, Alex Molnar, Ross Mooney, Dwayne Huebner, Maxine Greene, Philip Penix, William F. Pilder, William J. Murphy, William F. Pinar, George Willis, and Francine Shuchat Shaw all had one or more essays in the collection.

Pinar, in his preface to the text, outlines the curriculum field of the mid-1970s and elaborates on the reconceptualization. His cartography divided the field into three different tropes, themes, or areas. The first area was the traditional field characterized by curriculum development whose purpose was to prescribe and assist those at work in the schools. Pinar described the work as atheoretical. It served the purposes of answering how-to questions and providing guidelines for practitioners.

The second division in the field was the conceptual empiricists. This group, according to Pinar, comprised approximately 15% to 20% of the curriculum field at the time. This faction of the field was concerned with the theoretical, methodological, and practical orientations of the social sciences. The orientation was to apply the work of the social sciences to the questions of curriculum. The goal of this work was connected with issues of prediction and control, particularly of behavior.

The book is primarily committed to the work of the group that represented approximately 3% to 5% of the curriculum field at that time of the book's publication. The major concern of this group was to understand curriculum (which has become the major orientation in the field and generated much debate). The purpose of this work (i.e., reconceptualization) was not to be a guide to practitioners nor to apply the works of social science to curriculum, but to bring the conceptualizations of the humanities to the work of curriculum. At the historical moment of the 1970s, the work of history, continental philosophy, and literary criticism was being applied to the study of curriculum. The focus of study by these scholars changed the orientation of curriculum from the exclusively scientific and behavioral to existential experience,

politics, and consciousness. Pinar emphasized that this group's primary focus was on the understanding of educational experience.

Pinar also discussed in this text that reconceptualization went through three stages—that is, a field of study goes through stages. The first stage of a field is the development of a tradition. In the case of the curriculum field of the 1970s, it was the Tylerian tradition. The second stage is the stage of critique. This stage is made up of the critique of the tradition. According to Pinar, this stage could be as painful for the critic as it is for the critiqued. The third stage is the introduction of a new focus for a field (i.e., curriculum), which meant the reconceiving of the issues and areas the field covers. *Curriculum Theorizing: The Reconceptualists* was part of that process of reconceiving. The works of the scholars that were included were examples of that very attempt to reconceptualize the field.

One problem that arose from the title of this text was confusion over the terms *reconceptualists* and *reconceptualism*. These terms suggested a movement or a theoretical cohesiveness among those scholars working in the area that was not necessarily present. The terms, however, were used in the field of curriculum to describe the process of the reconceptualization that was multifaceted and multidimensional. The terms can best be described as misnomers. Despite this confusion over terminology that may have arisen from this book, it stands as one of the most important texts in the beginning of the reconceptualization of the curriculum field and its movement from the preoccupation with curriculum development to the complex notions of understanding curriculum.

## CURRICULUM THEORY

---

U.S. curriculum theory is the interdisciplinary study of curriculum in its historical, political, racial, gendered, postmodern, autobiographical, religious, and international dimensions. The contemporary field is structured by three main historical moments. The first was the field's inauguration and paradigmatic stabilization as curriculum development (1918–1969). The second was the field's reconceptualization, first occurring from 1969 to 1980 with the transition from curriculum development to curriculum studies and continuing from 1980 to 2000 as the interdisciplinary academic field paradigmatically organized around understanding curriculum. Most recently, the U.S. field is undergoing a process of internationalization, beginning in 2000.

### Curriculum Development

The culminating event of the first paradigmatic moment was the appearance, in 1949, of what has been termed the bible of curriculum development: Ralph W. Tyler's *Basic Principles of Curriculum and Instruction*. This thin book—it began as the syllabus for Tyler's course on curriculum taught during the 1930s and 1940s at the University of Chicago—is organized around four questions that, he thought, should guide curriculum development: (1) What educational purposes should the school seek to attain? (2) What educational experiences can be provided that are likely to attain these purposes? (3) How can these educational experiences be effectively organized? (4) How can we determine whether these purposes are being attained? Within the university-based academic field of curriculum studies, however, criticism of the Tyler Rationale appeared, eventually became voluminous, and finally, became decisive, in spite of ongoing efforts to rescue it. Despite its intellectual fate within U.S. curriculum theory, bureaucratic versions of Tyler's protocol have remained in wide circulation in U.S. public schools. What is distinctive—for many critics lamentable—about Tyler's Rationale is that it links objectives to evaluation, ensuring that teaching is relegated to a form of implementation, the success of which is likely measured quantitatively. In Tyler's scheme lies the

rationale for contemporary schemes of accountability of standardized examination. Before the 1960s and the events triggered by *Sputnik* and antiwar and civil rights protests, the Tyler Rationale was extended, but not challenged.

The Soviet Union successfully launched *Sputnik I* on October 4, 1957. The world's first artificial satellite provoked new political, military, technological, and scientific developments. It marked the start of the United States versus the USSR. space race. In the aftermath of *Sputnik*, Democratic presidential candidate John F. Kennedy made public education a major issue in the 1960 campaign against Richard Nixon. After Kennedy's election, his administration initiated a national curriculum reform movement, designed to transfer sophisticated disciplinary knowledge in the elite universities to the public schools. Toward this end, curriculum professors and schoolteachers were passed by; disciplinary specialists led curriculum development initiatives. A cognitive psychologist—Jerome Bruner—and a geneticist—Joseph J. Schwab—became the designated architects of reform-minded curriculum theory.

### Reconceptualization and Contemporary Curriculum Theory

With its traditional *raison d'être*—curriculum development—hijacked by politicians and their academic allies, curriculum theory went into crisis, resulting in a paradigm shift. Bureaucratized curriculum development—associated with the Tyler protocol—was replaced by an interdisciplinary academic effort to understand curriculum: historically, politically, racially, autobiographically—biographically, aesthetically, theologically, institutionally, and internationally, as well as in terms of gender, phenomenology, postmodernism, and poststructuralism. In the reconceptualized field, there were obvious links to earlier phrases: theological curriculum studies, for instance, can be linked to John Dewey's articulation of a common faith and political curriculum theory recalled the earlier interests of the social reconstructionists. Reconceptualized theological curriculum theory emphasized Latin American liberation theology rather than U.S. traditions, however, and reconceptualized political theory was avowedly neo-Marxist in orientation. And both sectors of scholarship addressed issues of

understanding curriculum rather than directing reform efforts in the schools. Due to the differences, the field became unrecognizable to many scholars who had come of intellectual age during the first paradigm.

Contemporary curriculum theory incorporates literal and institutional meanings of the concept of curriculum, but it is by no means limited to them. Curriculum is now a highly symbolic concept. Curriculum is now understood to be an extraordinarily complicated conversation. Through the curriculum and our experience of it, we choose what to remember about the past, what to believe about the present, what to hope for and fear about the future. Curriculum debates—such as those over multiculturalism—are also debates over the U.S. national identity. The traditional field had been ahistorical; contemporary curriculum theory is defined by its historicity. The traditional field had focused on bureaucratic protocols; the contemporary field is focused on the interdisciplinary study of educational experience.

This interdisciplinary structure of the field, and especially the strong influence of the humanities and the arts, makes curriculum theory a distinctive specialization within the broad field of education, a fragmented field broadly modeled after the social and behavioral sciences. As a distinctive interdisciplinary field (rather than subfield of a single academic discipline such as educational psychology or the sociology of education), curriculum studies may be the only autonomous academic discipline within the broad field of education. Several of the social sciences—most prominently academic psychology, but sociology as well—have colonized much of the field of education. Only curriculum theory has its origin in and owes its loyalty to the discipline and experience of education.

In its interest in and commitment to the study of educational experience, contemporary curriculum theory is critical of contemporary U.S. school reform. In this time of pervasive vocationalism, including academic vocationalism, when the curriculum is assumed to be courses of study leading to competence in the academic disciplines, curriculum theory testifies to the progressive insistence that education have value for society and the self, that its end is not only itself, but rather, that it must engage and extend the interests—intellectual, psychological, social—of students. Such engagement is

not a matter of seducing stubborn young minds into the school subjects, especially as these are aligned with their more sophisticated parent disciplines as these are currently compartmentalized and bureaucratized in colleges and universities. Rather, teaching—from the point of view of curriculum theory—is a matter of enabling students to employ academic knowledge (and popular culture, increasingly via the media and the Internet) to understand their own self-formation within society and the world.

Such understanding is both individual and social, local and global, historical and futural (terms with blurred boundaries, as each is embedded in the other). Its contextualization in the ongoing self-formation of students in anticipation of their participation in the public sphere not yet formed requires that teachers communicate the social, ethical, and political potential of what in the current curricular regime sometimes seems rather ivory-tower indeed. Curriculum theory is, then, about discovering and articulating for oneself and with others the educational significance of the school subjects for self and society in the ever-changing historical moment. As a consequence, curriculum theory rejects the current business-minded school reform, with its emphasis on test scores on standardized examinations, academic analogues to the bottom line—that is, profit. By linking the curriculum to student performance on standardized examinations, politicians have, in effect, taken control of what is to be taught: the curriculum. Examination-driven curricula tend to demote teachers from scholars and intellectuals to technicians in service to the state. The cultivation of self-reflexive, interdisciplinary erudition and intellectuality disappears. Rationalized as accountability, political socialization replaces education.

In this time of pervasive vocationalism, including academic vocationalism, when the curriculum is assumed to be a means to higher scores on standardized examinations, curriculum theory testifies to the progressive insistence that education have value for society and the self, that its end is not only itself, but rather, that it must engage and extend the interests—intellectual, psychological, social—of students. Curriculum theorists understand that such engagement is not a matter of obtaining compliance from stubborn young minds with institutional agendas of accountability.

Rather, teaching—from the point of view of curriculum theory—is a matter of enabling students to employ academic knowledge (and popular culture, increasingly via the media and the Internet) to understand their own self-formation within society and the world.

Curriculum theory understands teacher education as engaging prospective and practicing teachers self-reflexively in interdisciplinary study, study often located at the intersections of self and society, the local and the global, and the school subjects and everyday life. Moreover, both schooling and education (intersecting, but hardly identical terms) are studied at their organizational and intellectual center, the curriculum. They are also studied historically, in part to enable teachers to appreciate how they came to be working under current conditions, among them diminished academic freedom, including the loss of control over the means by which teachers assess students' study and academic accomplishment.

Curriculum theory understands teacher education not as learning a new language for what teachers already do, although the language we employ to understand what we do structures, as well as represents, professional conduct. Curriculum theorists appreciate the limitations of the language of learning, embedded as that term is in academic psychology, rather than in psychoanalysis. Curriculum theorists appreciate the significance of employing ethical, religious, and aesthetic languages to depict and structure their professional activities as educators. Curriculum scholars are often suspicious of rhetorical bandwagons such as competency based or outcome based or standards and immediately go to work to situate them historically in terms of the discourse systems in which they operate, especially in politicians' obfuscating rhetoric.

In studying curriculum theory, then, teachers are not being asked to learn how to do something new in the classroom, although their conduct there may well be altered, perhaps even transformed, as a consequence of studying curriculum theory. How it will be altered or transformed one cannot predict, however. Curriculum theorists do not regard their task as directing teachers to apply theory to practice, a form of professional subordination. Rather, curriculum theorists in the university regard their pedagogical work as the cultivation of independence of mind, self-reflexivity, and an

interdisciplinary erudition. They hope to persuade teachers to appreciate the complex and shifting relations between their own self-formation and the school subjects they teach, understood both as subject matter and as human subjects.

Skeptical of business thinking and of military discipline, both of which continue to be invoked as corrective to the supposed lack of rigor in schools (a gendered and racialized as well as academic judgment), curriculum theorists appreciate that the profession of teaching requires them—as faculty, that is, as private and public intellectuals—to understand and participate collaboratively in the school, including in the governance of the day-to-day life of the institution and in the administration of academic matters such as curriculum content, teaching styles, and the assessment of students' study.

Participating in the governance of the school requires curriculum theorists to remain (or to become) self-aware of the multiple functions and potentials of the process of education and of the institutions that formalize them. This requirement means becoming articulate about and exercising influence over curriculum content, including interdisciplinary configurations (such as women's and gender studies), theories of pedagogy, and the various means of assessing student study. How all this gets worked out, including teachers' already overburdened schedules (too many students and too many classes continue to characterize teachers' underpaid and unprofessional lives in too many schools) is outside the purview of curriculum theory, but its scholarly understanding is not.

Curriculum theory is a form of practical-theoretical reason. As such, it is not subject to the scientific norms of reason and truth. Curriculum theory can be best understood as extension and reconfiguration of theory in the humanities and the arts. Curriculum theory is significantly informed as well by social and autobiographical theory, themselves intersecting domains. Curriculum theory, then, is a form of autobiographical and theoretical truth telling that articulates the educational experience of teachers and students as lived. As such, curriculum theory speaks from the subjective experience of history and society, the inextricable interrelationships among which structure educational experience. The role of language in such truth telling is key. If curriculum theorists

employ, for instance, that bureaucratic language in which teaching becomes not an occasion for creativity and dissent and above all, individuality, but rather, the implementation of others' objectives, the process of education can become mutilated. Whatever language they employ, they become the language.

Curriculum theory reminds those committed to the project of education (which of course, does not always coincide with what goes on in the schools) that for intelligence to be cultivated in fundamental ways, it must be set free of corporate goals. Such an idea hardly excludes instrumental reason, calculation, and problem solving as major modes of cognition. Intellectual freedom must allow, however, for meditative, contemplative modes of cognition, and for exploring subjects—those associated, for instance, with the arts, humanities, and social sciences—that may have no immediate practical pay-off and might not be evaluated by standardized examinations.

### Internationalization

The events of September 11, 2001, intensified the sense that U.S. scholars must attend to curricular developments worldwide. The International Association for the Advancement of Curriculum Studies was founded with an affiliate in the United States, American Association for the Advancement of Curriculum Studies. Scholarly interest in the international study of curriculum is not a new phenomenon, however, evident in the scholarship of George Counts and other U.S. progressives. In the early decades of the 20th century, internationalism—associated with political movements on the Left—was advocated by the United States

Until recently, however, much of the North American scholarship devoted to understanding curriculum internationally had been conducted in Canada. In 2003, the first international handbook of curriculum research was published in the United States. Internationalization promises deepened understanding of the local through encounter with the global and the collective. Unlike globalization, internationalization promises to intensify the intellectual sophistication of U.S. curriculum theory, especially that theory committed to multicultural, gendered, and political activism toward social justice

and ecological sustainability. Internationalization promises a third paradigmatic shift in U.S. curriculum theory, the outlines of which are just now coming in view.

## CURRICULUM THOUGHT, CATEGORIES OF

---

Since its inception, the curriculum field has exemplified diverse perspectives or schools of thought. Several of the prominent category schemes have been developed by Herbert Kliebard, Michael

Schiro, William Pinar, Elliot Eisner, John McNeil, William Watkins, and William Schubert, among others.

When the curriculum field emerged in the late 19th and early 20th centuries, it was already a time of considerable diversity as delineated by curriculum historian, Kliebard. He identified four categories or interest groups that emerged to contend in what he called a crucible of curriculum reform efforts: humanists, developmentalists, social efficiency proponents, and social meliorists. The humanists, such as Charles Eliot and William Torrey Harris, advocated variations on a liberal arts and sciences curriculum, whereas developmentalists such as G. Stanley Hall saw the need for a psychology of curriculum that connected human development to the development of the human race throughout civilization. Thus, developmentalist roots were found in the Herbartians, who built on the cultural epoch theory of Johann Friedrich Herbart. The social efficiency interest group advocated from applications of science to curriculum making, finding proponents that ranged from a pediatrician (Joseph Mayer Rice) to educational psychologists and measurement advocates (e.g., James M. Cattell, E. L. Thorndike, Charles H. Judd) and efficiency-minded curriculum designers (Franklin Bobbitt, W. W. Charters), both of whom fell under the influence of time and motion studies advocated for efficiency in business and industry. This factory model of education associated with Frederick Taylor was contested by social meliorists, such as Lester Frank Ward, who saw curriculum as a basis for cooperation and democratic collaboration. Kliebard did not place the work of John Dewey in any one of these categories; instead, he saw Dewey as hovering among them, challenging them to eclectically blend the deepest and most profound dimensions of each for the productive benefit of learners and curricula that influenced them.

Sometimes, perhaps due to such unique placement of Dewey, progressive and traditional forms of education were seen as the two most prevalent categories of curriculum in the first half of the 20th century. These are the categories compared in the renowned Eight Year Study of high schools, the results of which were published in 1942, showing that progressive practices were equal or superior preparation for college.

Michael Schiro developed the following categories for curriculum ideologies based on the ways in which categories of philosophy of education were articulated: scholar academic, social efficiency, child study, and social reconstruction. Also drawing from philosophy, Robert Zais has shown that curricular positions can be traced to three orientations of philosophy: other worldly, earth centered, and man centered. Such categories or their synonyms have had a lasting effect; however, scholars engaged in the emergence of curriculum studies in the 1970s offered more specific categories, apart from the traditions of educational philosophy. Notably, Eisner and Pinar provided categories that helped shape the emergent movement of the field from sole focus on curriculum development to the study and understanding of curriculum as a social phenomenon. Categories of each of these curriculum theorists and their respective colleagues evolved over the years. For instance, in the early 1970s, Eisner with colleague and former student Elizabeth Vallance presented key work of notable scholars of the day that illustrated five conflicting conceptions of curriculum: cognitive processes, technology, self-actualization, social reconstruction, and academic rationalism. John McNeil has argued for similar categories in his widely used introductions to curriculum literature, beginning in 1978: humanistic, social reconstructionist, technology, and academic subjects. In several editions of *The Educational Imagination*, beginning in 1979, Eisner refined six curriculum ideologies, culminating in the following: religious orthodoxy, rational humanism, progressivism, critical theory, reconceptualism, and cognitive pluralism. Eisner often has expressed an intellectual debt to Schwab's distinction between theoretic and practical inquiry in curriculum and his advocacy of an eclectic position that Eisner in turn applies to the conflicting conceptions and ideologies he has delineated over the years, showing that at increased depth there exists complementarity along certain lines.

Starting in the mid-1970s, Pinar offered a three-part characterization of the origins of the curriculum field: first, traditionalist, supporting curriculum development in schools; second, conceptual empiricist, emphasizing both business efficiency and the deification of quantitative scientific studies; and third, reconceptualist, moving into new directions that added an organic view of nature, a concept of

individuals as creators of knowledge and culture, experiential bases of method, attention to preconscious experience, liberty and higher levels of consciousness, means and ends that include diversity and pluralism, political and social reconceptualism, and new language forms (derived from analyses by Paul Klohr). Pinar advocated the move from curriculum development (with an emphasis on orchestration of extant fields of knowledge for dissemination) to curriculum studies that now characterizes the field, offering emphasis on the importance of *currere*, the active verb form of curriculum, denoting the conscious reconceptualizing or theorizing of meaning in present flow of living, based on interpretation of the past and anticipation of possible futures. In order to grasp the immensity of the task of understanding curriculum, Pinar and his colleagues have shown that numerous discourse communities have each provided texts that enhance insight and awareness through the following perspectives: historical, political, racial, gender, phenomenological, poststructuralist and postmodern, autobiographical and biographical, aesthetic, and theological. These enable understanding to advance more fully than by merely addressing the institutionalized texts of the past that focus on curriculum development, teachers, and students. Moreover, through such texts, Pinar and colleagues have advocated curriculum studies that is internationalized as well as reconceptualized.

Schubert has offered curriculum studies and practice-oriented categories that have also evolved over the years since first being presented in the 1980s. These now include intellectual traditionalist, experientialist, social behaviorists, critical reconstructionist, and postmodernist perspectives. Schubert's former student, William Watkins, has addressed the problem of cultural homogeneity in category systems by offering the following Black orientations to curriculum theory (that paralleled the development of White, Eurocentric curriculum theory, but was not accepted in the latter literature): functionalism, accommodationism, liberalism, reconstructionism, Afrocentrism, and Black Nationalism. Adopting a more process-oriented category scheme, John P. Miller and Wayne Sellar categorized curriculum orientations as fostering transmission, transaction, or transformation. Miller also has distinguished conventionally analyzed categories with a more holistic orientation. The interest of transformation

speaks to the future of the field itself, raising questions as to whether these diverse category schemes represent sophistication or confusion. Some argue that the pluralistic nature of extant categories represents refreshing attempts to conceptualize and interpret a highly complex array of interests. Many indicate that together these categories capture more of the terrain than would one settled category scheme. Indeed, a rich uncertainty may be the best place for pursuit of questions that can be only partially and conditionally answered.

## CURRICULUM VENUES

---

Curriculum is often assumed to be the intended curriculum or the policy statement from a school

or other educational institution or relationship; however, there exist simultaneously a diverse array of venues of curriculum that should be interpreted in order to understand any curricular context. Such venues include the following variations on curriculum: intended, taught, experienced, embodied, tested, hidden, null, outside, clandestine, and exiled or in-between.

Before discussing each of the above venues in brief, it is important to juxtapose them with two conceptions that illustrate the complexity of curriculum as envisioned in curriculum studies. One conception is that which Joseph Schwab developed in *School Review* in 1973. He argued that the translation of curriculum in practical situations involves understanding a dynamic interaction of four curricular commonplaces: teachers, learners, subject matter, and milieu. The consequences of the impact of each of these commonplaces on the others is the curriculum. The other conception is provided by Arthur W. Foshay, who depicts a *curriculum matrix* as a three-dimensional interaction among 25 variables in three categories: *purpose* (intellectual, emotional, social, physical, aesthetic, transcendent), *substance* (mathematics, science, history or social studies, language and literacy, writing and composition, foreign languages, arts, vocational and technical, cocurriculum, school culture), and *practice* (evaluation, cost, governance, circumstances, when, how, why, what, who). Together, these conceptualizations of curriculum complexity illustrate the daunting task of those who try to understand and influence curriculum.

From such perspective, it is clear that *intended curriculum* is important, though far from the total picture. Intended curriculum pertains to the explicit policy statements from governments, ministries of education, state departments of education, school districts, local schools, and nonschool agencies or organizations that express an educational mission. The part of the educational mission that deals with that which is purported to be taught and learned is the intended curriculum.

The *taught curriculum* usually differs, in large or small ways, because the manner of teaching and the personality of teachers, as well as their individual choices and supervision or lack thereof provides a curriculum that varies from stated intentions.

Despite differences in intent and teaching, the ways in which learners' accumulated experiences meet the teaching-learning situation, the *experienced curriculum* provides another lens for interpreting curricular impact.

To merely experience something does not mean that it remains in the person who experiences it. Sometimes tests of application are used to determine whether aspects of curriculum have been received by learners. However, application does not mean that it has become part of a learner's life. The *embodied curriculum* is a conceptual venue designed to capture this phenomenon.

The *tested curriculum*, highly touted today as indicative of the educational bottom line, something measurable and equivalent to the quarterly report in the corporate world, can be seen as a rather miniscule dimension of the pervasive effects of any curricular situation.

This point is accentuated by introducing the *hidden curriculum*, which comprises diverse dimensions. First, it can be simply the mannerisms of the teacher, some of which are intended as subtle influences (politeness or interest in learning) and others that are unknown by the teachers—functions of personality, positive or negative, that often influence learners more fully than what the teacher intends. Second, the hidden curriculum is structural, meaning that values, prejudices, and ways of living that are part of the surrounding society and culture are reproduced by the educational institution and thereby become hidden curricula.

The *null curriculum*, a term coined by Elliot Eisner, refers to that which is not taught. It influences by its absence. Sometimes topics are not even considered as possibilities, and at other times, they are discarded as less important than that which is selected as part of the intended curriculum (or other venues of curricula for that matter). In addition, part of the intended curriculum can be shifted to null curriculum status when budget cuts occur or when powerful priorities are set in motion.

The *outside curriculum* pertains to that which occurs in the lives of learners to shape who they are and who they might become. Such curricula exist in homes, families, nonschool organizations (from church, sports, and the arts, to street gangs), informal peer relationships, jobs, hobbies, and mass media (e.g., television, radio, video, popular music, magazines, papers, books, the Web, computer

worlds, videogames). Each of these constitute curricula with intended, taught, experienced, embodied, hidden, tested, outside, clandestine, and exiled or in-between dimensions. To understand any one of these curricula in a person's life, it would be valuable to know about the others to have a more full understanding of the whole person.

Part of the outside curriculum is often neglected because those who are relegated to the periphery of any society are heard less. *Clandestine curriculum*, as expressed by William Watkins and by Susan Berger, pertains to that which develops without permission from controlling or dominating forces, such as curricula that have evolved among prisoners in concentration camps, slave societies, or other colonized peoples.

*In-between curriculum* is a curriculum that derives from exile. When persons leave one culture to live in another, they often find themselves in a state of exile from both. Their lives are in a state

of being in between without knowing the whereabouts of home, as well-depicted with Chinese immigrants in North America by Ming Fang He.

This sample of curriculum venues is only the tip of the iceberg of complex curricular phenomena explored in curriculum studies. A complex understanding of curriculum must attend to all of these and more.

## *DARE THE SCHOOL BUILD A NEW SOCIAL ORDER?*

---

Curriculum studies have long examined the interaction of school knowledge and the social order. Many question whether schools contribute to dynamic thinking and human agency or conforming acceptance to cultural norms. George S. Counts's booklet *Dare the School Build a New Social Order?* critiques the socializing function of schooling as it searches out the politics of possibility in the curriculum.

Concerned with America's social and economic inequities, University of Chicago graduate and longtime Columbia University professor of education, Counts (1889–1974) (re)examined schools and the curriculum through a series of essays in the 1920s. Jolted by the Great Depression, Counts critiqued “progressive” education as limited and set forth a new politicized, some say radical, agenda for education. Three papers delivered in 1932, “Dare Progressive Education Be Progressive,” “Education Through Indoctrination,” and “Freedom, Culture, Social Planning, and Leadership” were published as *Dare the School Build a New Social Order?* that same year. This book is often viewed as the platform of the social reconstructionist movement.

Counts's earlier books, including *Selective Character of American Secondary Education*, *Social Composition of Boards of Education*, *School and Society in Chicago*, and *The American Road to Culture* set the stage for *Dare the School*

*Build a New Social Order?* In those works, he examined the failure of (high) schools to reduce economic inequality, substantiated corporate control of educational policy, spotlighted the resistance to elite influence in school governance in Chicago, and commented on the role of school in culture making.

The first section of *Dare the School Build a New Social Order?* presents a critique and break with progressive education and the Progressive Education Association. Counts wrote of his great hope for schools, namely the curriculum, to be active and vibrant in addressing social issues. Focused on child centeredness, progressive education lacked a social point of view and was unable to spread social democracy. He wrote that in the midst of economic catastrophe and political uncertainty it had no theory of social welfare and no political direction. The progressives, he argued, were good liberals under the influence of middle-class elitism. They were romantic sentimentalists who could not grasp the urgency for sweeping social and economic change. He concluded that authentic education must go beyond the uplift of children to promote an understanding of the world.

In the next section, Counts examined critics of his reconstructionism who raised fears of indoctrination and imposition. He believed the indoctrination thesis was a red herring. Children are not autonomous and are inevitably socialized into cultures and traditions. The real problem for Counts was not indoctrination, but rather an irrelevant and impotent curriculum in matters of social democracy. Counts scoffed at the mythological

paradigm of impartiality wherein schools produce dispassionate agnostic individuals who withhold judgment in the interest of objectivity. Children and society, he argued, are not neutral and in fact are influenced in many ways. He suggested we place our concerns on the ideals of our society.

Section 3 joins Counts's views on technology with the role of teachers in transforming society. He proclaimed that the center of gravity is shifting from politics to economics. The conquest of nature and scientific advancement allows for the creation of abundance where poverty is finally banished. Economic democracy in the technological industrial society can end want, creating goods and services for all. Despite the Depression, a new world is on the horizon. It needs us. For Counts, teachers are uniquely positioned, for they possess the knowledge and wisdom of the ages. They are organized and presumably have the interests of the children and society at heart. Teachers should reach for power, for they are the bridge between school and society.

Section 4 explores the contradictions and possibilities for democracy within the industrial society. Counts reminds us that the United States has a democratic tradition rooted in revolutionary impulses. Democracy had to be fought for. For him industrial feudalism has brought with it parasitism, privilege, and the hegemony of property. Despite excesses, the possibility for democracy still exists. He argues that our society needs a social agenda, and that this agenda demands that the industrial machine serve the many, not the few. The resources of society must serve the welfare of the masses. We need collective ownership of the important resources. Technology must be used for the good of all.

The final section is a broad political and philosophical treatise. He indicts the fetish of property and greed as it debases us all. He writes capitalism is cruel, inhumane, wasteful, and inefficient. It thrusts our society, and indeed the world, into crises. We must reconstruct the economy and our social ideals. He concludes that schools and teachers are an important part of the vision of a democratic collectivist society.

## DELEUZEIAN THOUGHT

---

Gilles Deleuze's philosophy as applied to rethinking the curriculum foundations of education has received more and more attention. Historically, Jacques Daignault, Ted Aoki, Gustav Roy, William Reynolds, and Julie Webber have attempted to theorize Deleuze along curriculum lines. Most often Deleuze is labeled a poststructuralist, but such a generalization fails to recognize his own unique contribution to psychoanalysis and the Bergsonian dynamics of image and memory; both domains challenge the linguistic text. Under Deleuze, desire is given a positive conceptualization at the prereflective unconscious, while the image of thought presents a radical affective epistemology that confronts categorizations.

Generally speaking, a number of concepts developed by Deleuze (along with his cocollaborator Félix Guattari, his often cited coauthor) lend themselves to curriculum theory, which are proving to be influential: rhizome, minor literature, multiplicity, and difference. Their reception and articulation into the field of curriculum theory, however, remains uneven and reductionist, dependent on the knowledge and application of the educator. Deleuze's comprehensive theory requires standing the philosophical tradition on its head and then further making sense of pedagogy and the curriculum in such a changed universe. Some broad strokes as they pertain to curriculum theory can be articulated to give the reader a sense of the potentiality (and not possibility as is so often stated) of a Deleuzian philosophical invasion comparable to the one that has already taken place by a portion of the educational field embracing the philosophy of Michel Foucault.

The most dramatic aspect of Deleuzian thought is his reorientation from transcendent to immanent

modes of thinking—that is, from notions that structure knowledge and time from universalist positions of authority, meaning, and law to an emergent creative process of actualization to produce events that have their own singularity of time. Time is not homologous and linear, but constituted by heterogeneity and difference. Deleuze paradoxically names his philosophy as transcendental empiricism. This term also means a rejection of dialectics that has characterized critical pedagogy in education spearheaded by Paulo Friere and followers such as Henry Giroux and Peter McLaren. Deleuze searches for a nondialectical philosophy of becoming that avoids the path of negation as famously developed by the Hegelian dialectic of sublation as the synthesizing of differences. In contrast, the Deleuzian trajectory is meant to forward difference and singularity in such a way that avoids the notion of difference caught by representation as practiced by all forms of pedagogical identity politics, not to mention this also being the very form of designer capitalism. The ontological quest for being is supplanted by the ontological creation of becoming.

Such an inverted universe, what Deleuze and Guattari refer to as the plane of immanence, if embraced by educators would begin to ruin representation as the mobilization of their concepts would begin to deterritorialize the educational curricular field. The most obvious start of such ruination would be the planned curriculum, which is based on a lineal model of quantifiable time and restricted resources, thereby occupying an unreachable transcendent ideal position. Each reenactment or lesson already presupposes a failure, appearing as its shadow in the form of the lived curriculum. In this sense, curriculum as a lived possibility is supplanted by its potentiality. This important distinction between the two terms—potentiality and possibility—articulates why there is a continuous failure to achieve the transference of knowledge planned by teachers, measured and evaluated against a transcendental standard of development or achievement. Such efforts always remain in the realm of possibility.

In distinction, potentiality would take the lived curriculum as the place of becoming where the mobilization of desire is not already channeled by a transcendent plan. Creativity proper rests in such a becoming with knowledge redefined as a

multiplicity—that is, as the creation of concepts, thereby offering a striking contrast to how curriculum is to be perceived. Not only is it an emergent process, but also it suggests the making of a singular sensibility through a process that recognizes failure, accident, and fate—that is, life as Deleuze theorizes it. Also, when it comes to identity formation, it is not based on a litany of predetermined categorical signifiers that populate both educational theory and designer capitalism—sex, gender, color, age, ableism, race, ethnicity, and so on. Rather, the process of curriculum is theorized at the prereflective level of molecular formation, in Deleuzian terms, where time and certainly memory are the virtual factors. The curriculum now becomes the achievement of multiple heterogeneous sensibilities of differences. Each life is thereby different precisely for its potential to create the as-yet-unthought. Such a curriculum would orient itself to what Deleuze would call a pedagogy of individuation that radically departs from the entrenched paradigm of neoliberal individualism.

## DELIBERATIVE CURRICULUM

---

Deliberation is a formal process of inquiry about curriculum policy, program development, and other curriculum activity, including conflicting goals and values in specific situations of practice. Its fundamental purpose is to reach justified decisions about curricular action in particular contexts

considering the problematic character of a situation. Through this process, public policy decisions are implemented in social and typically institutional contexts with development of materials and strategies for their use. Deliberative inquiry focuses on curriculum policies and guidelines concerning a particular classroom and less often, a school, a district, a state, or a nation.

Researcher Ilene Harris depicted deliberative inquiry as a form of curriculum inquiry because it links the interrelated tasks of doing practical curriculum activity with doing formal curriculum inquiry, namely research, through a systematic structure of deliberation about curriculum decisions. This process of inquiry is informed by asking and answering subsidiary questions through multiple forms of inquiry for which deliberative inquiry serves as a framework to incorporate the results in decision making. Through formal curriculum inquiry, particular curriculum questions are identified, questions that are open to inquiry and can lead to definite answers addressed through appropriate forms of rigorous, disciplined, intellectual processes. Through practical curriculum, activity choices are made in specific situations relevant to policy questions about what should be taught, to whom, and under what guidelines of instruction, and they are based on thoughtful examination of alternatives in the context of values and knowledge. Practical curriculum activity should be informed by the results of formal curriculum inquiry. However, because any theory represents only a partial reality deriving from a generalization of a plethora of particulars and selected areas of research, curriculum judgment and action must be informed by multiple research approaches, sources of knowledge, theories, and principles.

The need for using deliberation in the curriculum was first identified by Joseph Schwab, who in the late 1960s argued that the field of curriculum is moribund due to the theoretic bend it has taken and is unable at its present form to contribute significantly to the advancement of education and the improvement of practice. He urged diversion of its energies from theoretical pursuits aimed at knowledge generation to practical disciplines emphasizing choice and action. Schwab, in his articles on the practical paradigm, associated the practical, perceived as a mode of inquiry rather than rules of thumb, with the method of deliberation. Practical arts employ perception and problemation to

recognize particularities of practical situations, to identify problems, and to generate alternative solutions to act upon the best one. He also proposed use of eclectic arts, which determine which combinations and portions of sciences and theories shed useful light on specific curriculum problems. Schwab suggested that in each phase of deliberation the four commonplaces—student, teacher, subject matter, and milieu, which are elements in every education situation—participate and are considered.

William Reid, who in 1982 coined the term *deliberative inquiry*, viewed deliberation in terms of practical reasoning. He saw curriculum problems as among a wider class of uncertain practical problems involving prudential, moral, and ethical considerations. These problems can be solved through deliberation or practical reasoning, an intricate and skilled intellectual and social process whereby, individually or collectively, questions are identified, grounds are established for deciding answers, and a choice is made among the available solutions. The ambiguity of the choices made and of the outcomes of the decisions are what attribute uncertainty to these problems. Reid argued about the importance of considering institutional and political contexts in conducting deliberations, the effect of relevant facts, and acceptable solutions. Also, Decker Walker in the 1970s formulated a naturalistic model for curriculum development, a model that represents phenomena and relations observed in actual curriculum projects as realistically as possible, and it includes processes of deliberation and practical reasoning as central features. In this model, both theory and practice are modes of inquiry, each competent in its own sphere and each informing the other via the radical differences they carry.

Deliberative inquiry is an educative process for participants, who gain competence in deliberation and reflection, insights, and new perspectives, and who experience growth as they try to determine the relationship between means and ends in a constant, circular negotiation process. Specifically, as a group—ideally composed of students, teachers, subject-matter experts, and stakeholders—they discuss what to do and begin to clarify values that inform their choices. This new, collective understanding reshapes their ideas about what should be done.

## DEMOCRACY AND EDUCATION

---

Considered by John Dewey to be for many years the most fully stated expression of his philosophy, *Democracy and Education* was published in 1916, the year before the United States entered World War I. The book has remained continuously in print since the time of its first publication. By his own account, *Democracy and Education* is a comprehensive expression of Dewey's experimentalist philosophy in relation to the great social transformation taking place in the world through science and industry, requiring an accompanying transformation of the aims and methods of public education in the light of U.S. democracy.

Influenced by Charles Darwin, Dewey held that society itself exists through a transformation process of growth and renewal like biological life and that education is the means of generating the social continuity of life. He defined education in terms of growth—as the reconstruction of experience, adding to the meaning of experience and increasing the ability to direct the course of subsequent experience. In effect, Dewey held that education for democracy required an education that would put the rising generation in control of its destiny; the process is one of growth and realization, not subordination. The school and society cannot be seen as progressive unless they are making progress, and this progress requires the release of human potential through the expansion of educational opportunity to all the children of all the people. In this vein, *Democracy and Education*

was and continues to stand as one of the most powerful and systematic expressions for opening the pathways to the needed education reforms in the building of U.S. democracy.

Virtually every chapter addresses problems and issues bearing on the school curriculum. In addition to the chapters “The Nature of Method” and “The Nature of Subject Matter,” individual chapters address each of the broad fields of the school curriculum: play and work; geography, social studies, and history; science; labor and leisure; and vocational education—as well as chapters on thinking, interest, experience, and aims in education.

For Dewey, the concept of knowledge laid down by the old literary culture is inadequate to the practical needs of modern democratic society. Democracy requires an enlightened citizenry, and the means to enlightenment is to be found through the methods of science or method of intelligence as used in life and not delimited to the pursuit of technical and specialized knowledge.

The essentials of method are the essentials of reflective thinking for problem solving and for the testing of ideas through application. The traditional school, Dewey pointed out, is still employing a curriculum that was fashioned and followed in and for an earlier era. Since knowledge is the outcome of method, there is no distinction of subject matter and method. The fact that a body of knowledge such as a science is organized is evidence that it has been methodized.

Throughout *Democracy and Education*, Dewey exposed the dualisms that plague thinking. In addition to the false dichotomy of subject matter and method, Dewey exposed such dichotomies as mind versus body, man versus nature, emotion versus intellect, ends versus means, nature versus nurture, intellectual versus practical, experience versus knowledge, social demands versus individual rights, individuality versus individualism, academic versus vocational, intellectual versus practical, essentials versus nonessential studies, logical versus psychological, objective versus subjective, pure versus applied knowledge, humanities versus science, and labor versus leisure.

Dewey was not calling for a happy medium, but for an attitude of gaining new perspectives on problems so as to create genuine insights for building needed solutions based on the best available

evidence. In effect, progress is not an end, but is always in the making.

## DERRIDAN THOUGHT

---

Curriculum studies advances through the work and thought of Jacques Derrida. Derridan thought, like curriculum studies, advances complicated conversations and difficult memories. Curriculum studies is a field that examines issues on teaching, the university, democracy, race, class and gender, sexuality, politics, ethics, responsibility, nation, place, and geography. Derrida complicates ideas such as these by deconstruction. For Derrida, deconstruction is a way to think through ideas. Deconstruction is not destruction; rather, it is a form of generative interpretation. Thus, to deconstruct terms in curriculum studies such as geography, nation, and identity—for example—Derrida suggests that each term founders under the sign of an *aporia*. Every idea is unstable as it entails its opposite. Derrida coined the term *differance*. The *a* in *differance* signifies that this is not the same as *difference*. *Differance* suggests that ideas are subject to delayed meaning. *Differance* is a maneuver, a shifting, a slippery movement between signified and signifier. Thus, for curriculum studies, the word *nation*—for example—is subject to the movement of *differance*. What *nation* means now is not what it will mean in the future. Meaning delayed.

Derrida thought that the dogmatic thought inherent in totalitarianism are dangerous. Much of Derrida's work is a reaction against dogmatism in

French occupied Algeria—as he grew up there as a Jewish child and suffered from anti-Semitism and colonialism—and the dictatorships of Hitler, Stalin, and Mussolini and the shame that was Vichy France. In response to the sameness that dictatorship demands, Derrida emphasizes the notion of the *alterity*. *Alterity* means absolute otherness; nothing can be reduced to sameness. Derrida makes much of the word *archive*, which is subject to the movement of the *aporia* and *differance*. The archive is overdetermined by memories, histories, cultures.

Derrida makes much of the term *revenant*. In relation to the archives of curriculum studies, the revenants of Karl Marx and Sigmund Freud are relevant. For Derrida, Marx and Freud haunt. Marx has made an impression on culture. No matter what, we are stuck with him. With the affront of neoliberalism, we have seen an explosion of Marxist theory in curriculum studies. And yet Marxism, some claim, is dead. Think of the former Soviet Union and the former East Germany, for example. The revenant of Marx haunts curriculum theory. It seems that many Marxists do not want to call themselves Marxists—although they use Marxist theory in curriculum studies. Likewise, the revenant of Freud haunts the psychoanalytic wing of curriculum studies. Some scholars would rather not say that they are Freudians. They might say that they are post-Freudians or Lacanians, but not Freudians. The name Freud haunts. There is something about the name Freud that makes some people uncomfortable. Curriculum studies advances through Derridan thought, especially through its psychoanalytic and political implications.

## DESCHOOLING

---

*Deschooling* is a complicated term and arises in discussions of various alternative forms of education such as free schools, community-driven opportunity webs, and in the current literature related to the homeschooling movement. Deschooling was introduced in 1971's *Deschooling Society*, written by Ivan Illich and included in the *World Perspectives* book series edited by the humanist philosopher, Ruth Nanda Anshen. In suggesting the disestablishment of schools—thus nurturing the opportunity for each person to engage in a curriculum of learning, sharing, and caring—Illich's writing was representative of the work of Anshen's series as a statement of possibilities in a progressive frame of social and moral consciousness.

Illich credits his long-term associate, Everett Reimer, for stimulating his interest in and critique of public education. Reimer and Illich collaborated on ideas of deschooling a variety of societal institutions in addition to education—institutions such as medicine, social programs, the military, and so on—during regular meetings at the controversial Center for Intercultural Documentation (CIDOC, cofounded by Illich in 1961) in Cuernavaca, Mexico. The two men came to the conclusion that the obligatory nature of the institution of school served to limit a person's right to learn and, broadly, that reliance on institutions and institutional processes served to preempt expectations for and reliance on personal goodwill. Even further, Illich and Reimer believed that the growing institutionalization of society served to strengthen and perpetuate the institutions in society. Illich credited Valentine Borremans, the director of CIDOC, for challenging him, in collaboration with Reimer, to engage in a perspective that led them to determine that it was not only the institutions of society, but the ethos of society that ought to be deschooled.

Illich's discussion of deschooling included references to the terms *tool* and *conviviality*. He argued that the institution of school is used as a tool that, through its systematic methods and schedules, reinforces the class hierarchies and economic inequities that, ironically, the institution of school purports to rectify. Although good curriculum work requires complicated decisions and conversations, becoming "schooled up" by policies of standardized

management uncomplicates school. Since most people are now all schooled up, the myth continues that the institution of schooling is efficient and benevolent.

For Illich, people were schooled to become more regimented, exploited, certified, and enslaved, losing their potential for creativity, potency, autonomy, freedom, novelty, and dignity. In contrast to a schooled-up society, Illich proposed a convivial society of curriculum scholarship that would allow autonomous and generative interactions among persons and their environments by means of tools least controlled by others. He considered conviviality as an individual freedom realized in personal interdependence and so, supportive of good curriculum work of relational and ethical value toward the common good.

Currently, deschooling is a term used by the homeschooling community to refer to the process of shifting away from the schooled mind-set after leaving the institution of school. It is also used in describing a period of time (many suggest 1 month for every year of institutionalized schooling) for children to adjust to learning without the regimentation of bells, workbooks, checklists, and standard schedules for learning.

## DESEGREGATION OF SCHOOLS

---

In the 21st century, school desegregation is still inextricably linked to the U.S. Supreme Court's *Brown v. Board of Education* (1954) decision, which declared racially segregated schools illegal. However, 10 years after *Brown*, not only were the

courts still undecided about what desegregation really meant, but the ruling in *Brown* had largely been ignored, especially in the South. To put an end to deliberate delays in desegregation, the 1964 Civil Rights Act ordered desegregation to achieve equality of educational opportunity—which is the idea that all people have an equal chance of achieving regardless of race, sex, or class. In general, the concept of school desegregation has influenced the curriculum studies field by providing an important historical backdrop that informs the development and design of the methods, policies, and procedures of this field to ensure that in a pluralistic society such as the United States the curriculum in schools is culturally, socially, and economically relevant and geared toward the equitable and successful education of all students.

Despite three major waves of desegregation efforts in the United States as a strategy to pursue equality of educational opportunity and to overcome school segregation, unequal access to courses, and unequal educational outcomes, over half a century since this landmark decision, schools in the United States are reportedly more racially segregated than ever before. In fact, as a result of Supreme Court decisions in the early 1990s, such as *Dowell v. Board of Education of Oklahoma City Public Schools* (1991) and *Freeman v. Pitts* (1992), as well as most recently *Parents Involved in Community Schools v. Seattle School District No. 1* (2007), public schools are becoming more segregated than before *Brown*. The current resegregation of schools, and failure to achieve the desegregation promised by *Brown*, is largely a result of rampant confusion about what desegregation actually means and how it is best achieved, as well as a result of fundamental differences between the related concepts of desegregation and integration of schools that has historically impeded, and continues to impede real progress in school desegregation efforts.

Although fundamentally different, desegregation and integration are often used interchangeably. Desegregation of schools is an equality of educational opportunity concept that refers to the idea that students of diverse racial backgrounds should attend the same schools as opposed to racially isolated and identifiable schools that are often marked by sweeping differences in resources, facilities, funding, curricula, and personnel. In

contrast, the integration of schools occurs not only when students of different racial backgrounds attend the same schools, but also when conscious and effective steps have been taken to overcome educational disadvantages and inequities that minority students in these environments often experience and to encourage and develop positive interracial interactions and relationships. In spite of the common, yet inappropriate, conflation of these concepts, the desegregation of schools, more so than integration, has been a major educational goal in the United States, as evidenced by numerous legal battles, court rulings, educational and social policies, and entire social justice movements over the last 50 years.

Just as desegregation and integration are fundamentally different concepts, the strategies used to achieve them are different as well. Specifically, two of the main tactics that have been used to foster desegregation are busing (which usually involves transporting minority students to majority schools) and school choice programs (which allow parents to select between schools based on their preferences for school philosophies or curriculum), both of which have often been implemented to the detriment of students. These tactics are largely aimed at simple restructuring of schools and the reorganization of students in a way that ensures that minority and majority students can and do attend the same schools, but little more. On the contrary, a main strategy used to integrate schools has been the focus on multicultural education, which seeks to provide students with historically accurate and sophisticated representations of the various cultural groups that comprise U.S. society. Thus, in terms of integration tactics, there is a keen focus on more than majority and minority students attending the same schools, such as respecting diversity and teaching all students to value the history, culture, and contributions of all groups as just as important and relevant as one's own.

The field of curriculum studies has also been particularly instrumental in school desegregation efforts with curriculum studies theorists, researchers, and educators impacting school desegregation in various ways. In this field, school desegregation has largely been addressed through the development of strategies aimed at not only changing the racial composition of schools and districts, but also addressing within-school segregation.

Specifically, the establishment of magnet and charter schools has been one tactic devised through the curriculum studies field to desegregate schools on the basis of talent or special interests such as science, math, or the arts. Similarly, detracking, or the heterogeneous grouping of students, has also been a primary strategy promoted by the curriculum studies field to facilitate school desegregation. In opposition to tracking, where students are categorized and assigned to groups based on measures of intelligence, achievement, or aptitude—which often results in students in different groups receiving different treatment and ultimately having vastly different educational experiences—detracking is believed to foster desegregation, and even integration, by mixing students of various abilities and skills in one classroom and thus requiring the curriculum to be modified so that all students are able to learn despite their various skill levels. Detracking also encourages students to learn from one another and to value what each other contributes to the learning experience. Ultimately, such tactics have been found to raise the academic achievement of minority students and to have no adverse effect on the achievement of White students. In fact, desegregation efforts have been noted to work best when they are comprehensive, covering multiple grade levels and large geographic areas and having clearly defined long-term goals.

The curriculum studies field has been particularly instrumental in devising and making popular the use of multicultural education as a major strategy to address within-school, and even within-class, racial segregation. Multicultural education was developed out of the *Brown* decision and is particularly relevant to conversations about educational reform. As a tool for school desegregation, multicultural education has a curricular emphasis on race and ethnicity. It recognizes and is largely focused on the identity and personality development of students through the use of a curriculum that is conscious of the values, beliefs, and goals it represents and teaches. Specific multicultural reforms have included utilizing texts that include the work and experiences of marginalized groups, recognizing and accommodating different learning styles and multiple intelligences, and implementing nontraditional and innovative pedagogical methods. Moreover, multicultural education aims to facilitate school desegregation by not only empowering students from

marginalized groups with the knowledge and tools to pursue social justice issues and foster real social change, but also informing both minority and majority students, and all involved in the educational process, about different cultures, customs, and ideas in an effort to improve the overall quality of education.

## DESKILLING

---

Deskilling refers to the process by which educators lose their dynamic roles as curriculum workers when they no longer are allowed to create or modify curriculum. Instead, they must deliver tightly controlled, packaged, fragmented, and “teacher-proof” curricular content such as commercially produced worksheets, scripted questions, and prepackaged units. Although deskilling chiefly refers to the work experiences of teachers, this

phenomenon has ramifications for learners and schools as deskilling ultimately discourages reflective practice, arts integration, multidisciplinary curriculum, creativity, intuition, and critical thinking. Deskilling has become a crucial issue in curriculum studies because it leads to the suppression of teachers' intellectual and moral responsibilities.

The theory of deskilling emanates from Harry Braverman's book, *Labor and Monopoly Capital: The Degradation of Work in the Twentieth Century*, published in 1974. Braverman maintained that modern production and standardization in capitalist societies changed work from a craft to atomistic, unskilled tasks. This thesis also emphasizes workers' isolation from production and management's escalating control of workers. A decade later, critical and feminist curriculum theorists made parallel arguments by focusing on teaching as a labor process in which centralization, efficiency, and isolation have severe repercussions for the teaching profession.

Scholars assert that deskilling has meant devaluing of teachers' academic expertise and denigration of the moral dimensions of teaching that encompass caring, nurturing, and attention to children's developmental or emotional needs. Other concerns are that as teachers deliver curriculum rather than use their academic and pedagogical expertise, they will in fact lose some skills. Or teachers may be hired because they do not have strong knowledge and skills because they can be paid low salaries and will be compliant—readily following scripted curriculum and feeling dependent on the state or administration to give them curriculum. Moreover, teachers may accept their deskilled roles as the discourse of corporatism and managerialism becomes legitimized.

Scholars explain that several factors have contributed to deskilling. First, highly publicized political attacks on schooling have led to tighter, more rigid state control of education via standardized and high-stakes testing, centralized curriculum decisions, and teaching evaluated only on the basis of behavior outcomes and test results. Business also has influenced education by demanding academic standards favored by industry to further support a market economy, promoting tracking of students into either college or worker preparation, and commercializing of education through the selling of curriculum packages, achievement tests, and required

television shows. Once more, corporate discourse predisposed parents to think of themselves as consumers who regard teachers as employees rather than as professionals.

A major factor in explaining how deskilling occurs is intensification. The concept of intensification describes the work conditions of teachers in contemporary schooling as affected by increased regulation. Intensification involves teachers' experiencing of expanded workloads that include manifold administrative tasks, reduction of genuine collegial opportunities, declining quality of life, and pressure placed on themselves and by others to meet managerial goals. In addition, high-stakes testing increases teachers' stress by punishing low performance rather than providing more resources to help teachers to work more successfully. Because of intensification, there is little time for creative curriculum making, and teachers need to rely on outside experts to prepare the curriculum.

Although not disputing the phenomenon of deskilling and its consequences, contemporary curriculum and policy researchers have offered critique of deskilling as a monolithic theory. First, they suggest that teachers experience intensification differently depending on factors such as their self-identities or organizational skills, the support received at home, and leadership in their schools. For example, some teachers work with principals who understand the demands of teaching and create school cultures that encourage meaningful work and community. Researchers also posit that teachers do not lose skills, but instead have become reskilled by developing new competencies including better understanding of assessment or increased collaborative skills to make the workload more manageable by sharing teaching strategies. Finally, scholars suggest that educators do not passively accept deskilling. Rather, teachers enhance their expertise through graduate study, participation in professional organizations, and teacher and action research. Furthermore, teachers mediate the mandated curriculum by introducing rich and meaningful content and resist deskilling through activism in opposition to working conditions and centralized curriculum.

## DEVELOPMENTALISTS TRADITION

---

The developmentalists tradition consisted of educational reformers who, at the turn of the 19th century, helped to determine the course of U.S. curriculum. Developmentalists believed that children should be taught based on the natural order of their development. Developmentalists agreed that schools in the 1800s generally treated children as receptacles of academic knowledge. Children were presented with subjects and teaching methods that opposed their natural predilections. Developmentalist reformers promoted the introduction of active participation that was harmonious with children's instincts and interests and child-centered study. In this way, developmentalists believed curriculum could become a means to unharness a child's natural learning. This entry describes the beliefs of the developmentalists tradition; the child-study movement; the work of its pioneer leader, G. Stanley Hall; and the criticisms of the tradition.

### Beliefs

At the end of the 19th century, the population of students attending U.S. schools and the course of studies offered in U.S. schools became influenced by a new social consciousness. The roles of the teacher and the school as the embodiment of social virtue and value that unified the community began to change. Predicting students' final career paths became the basis for adapting curriculum to U.S. schools' population. As cities grew, schools became responsible for helping students prepare to survive in the new industrialized world. By 1890, four major interest groups struggled for control of the U.S. curriculum. One of those groups was the developmentalists. (The others were humanists, social efficiency educators, and social meliorists.)

Hall, a pioneer in educational psychology, was pivotal as a leader in the developmentalist tradition. His research focused on the study of children's minds. He presumed that if educators were aware of what children knew, they would better be able to systematically teach them what they needed to learn. The child-study movement sought to observe and study children's development in laboratory and natural environments.

Hall and scholars of his time supported the cultural epoch theory, which posited that a child's individual development parallels the developmental stages through which the human race as a whole traversed historically. The theory's widespread acceptance as a valued principle supported a scientific order of curricular studies that integrated rather than isolated subjects. Curriculum could be understood as a scientific and historical epoch that was interrelated and sequenced. For example, while children were in their savage stage of development, they studied ancient fables and mythology that derived from that historical epoch. A curriculum so organized seemed to appeal to children's natural interests. It was believed children had a natural affinity to materials that fit with their epoch stage of development. Cultural epoch theory was endorsed by scholars and widely configured curriculum during this era.

Cultural epoch theory was supplemented by Hall's belief that young children were not capable of intellectual reasoning. He did not think schools should try to civilize children by training them to conform. He saw intellectual training as unhealthy and believed the stages of childhood and adolescence should be prolonged and promoted. Elementary curriculum should be dominated by play until children at least were 8 years old. Children should not be expected to take part in harmful intellectual tasks, but rather should play and follow their primitive interests.

Between 1890 and 1900, secondary school enrollment doubled for several reasons. Many people were moving to the cities, a move that made it easier for adolescents to attend school, and advances in technology, such as the telephone, caused high unemployment for young adults who often got work as messengers. As a result, many adolescents continued on in school whereas previously they went into the workforce. Developmentalists, such

as Hall, recommended that courses be offered in high schools that matched adolescents' natural interests, capabilities, and needs. For example, teaching literature was considered a necessary venue for learning morals.

Hall was also preoccupied with differentiated instruction that looked at methods for teaching various levels of learners. He viewed preadolescence, for example, as a developmental stage that required special consideration and instruction due to children's development. His views largely were responsible for the creation and large-scale incorporation of the junior high school, a separate school or group of grades for preadolescents. It was determined that preadolescents should be isolated from their older influential postpubescent peers. This practice continues today as a structure to allow instructors to meet the special needs of preadolescent learning and development.

### Criticisms

Although Hall and other developmentalist and child-study scholars pushed instruction and curriculum toward the natural order of a child's development, often it was believed that the tradition was infused with romantic ideas and mythical beliefs. Although child study was promoted as scientific, often its application to pedagogy was based more on beliefs than on data and evidence.

John Dewey argued that curriculum should present organized subjects directed by teachers rather than emerge from the child's development. Through this statement, he recognized that progressive education must move beyond its origins in the developmentalist tradition.

## DEWEY, JOHN

---

After having read John Dewey's *Democracy and Education*, published in 1916, James B. Conant commented that he had the feeling that if Dewey (1859–1952) had not existed, he would have had to be invented. As one of the greatest philosophers of the 20th century, Dewey had orchestrated pragmatism and the idea of progress with the U.S. democratic experience through education.

In his autobiographical account, Dewey briefly traced his journey from undergraduate years at the University of Vermont to graduate studies in philosophy at Johns Hopkins University. He pointed out that university faculty at the time were clergymen, but he added that the theological phase of his studies had no lasting influence on his intellectual development, except negatively. Dewey related that his upbringing in Vermont where he was born followed a conventionally evangelical path of the more liberal kind, but his struggles that were to arise between acceptance of the faith of his upbringing and his eventual discarding of traditional and institutional needs emerged not from philosophical teaching, but from personal experience.

### From Absolutism to Experimentalism

In his autobiographical essay, aptly titled "From Absolutism to Experimentalism," Dewey identified four connecting turning points that were to define his philosophical transformation. First was his recognition of the significance of the practice and theory of education in influencing the young, including himself. This point led to his realization that what otherwise might have developed as separate interests in psychology, social institutions, and social life became fused in his own thinking. Dewey noted that a critic had indicated that Dewey's thinking was permeated too much by interest in education. But Dewey expressed doubt that any philosophic critics had ever become acquainted with *Democracy and Education*, which

Dewey regarded as his most fully expounded philosophic work at the time. To Dewey, it was ironic that philosophers in general had not taken education with sufficient seriousness when they themselves are usually teachers. For had they done so, continued Dewey, it might have occurred to them that any rational person would come to regard education as the supreme human interest.

The second turning point in Dewey's philosophical development was his growing concern over the pervading dualism between science and morals, a dualism that he considered nothing short of an intellectual scandal in philosophical thought, for science is based upon the moral principle guiding systematic inquiry to find and act upon the best available evidence. Democracy, contended Dewey, requires that the methods of science or the method of intelligence infuse the U.S. mind through education. He warned that the use of science only for technical and specialized pursuits raises the danger that it will get its best chances in war. To Dewey, this is not science, but the political misuse and abuse of science.

The third turning point, according to Dewey, was the realization of the biological conception of mind as advanced by William James. Although many philosophers had addressed the idea of organism, their approach was mainly structural and static. For James, and later Dewey, we must think of life pragmatically as life in action. Like life, education is defined by growth and renewal. Dewey criticized the mechanistic psychology of the times, and envisioned the linking of philosophy to the significant issues of actual experience, with the methods and findings of psychology as life in action.

Dewey's fourth turning point was his vision of an integration or synthesis of a philosophy congruous with modern science and relevant to actual problems and needs in education, morals, and religion. And he envisioned the new unification in philosophy emerging when the social sciences and arts receive reflective attention as in the case of science.

### **Experimentalism as a Uniquely U.S. Philosophy**

To no small extent, Dewey's experimentalism proved to be a milestone in the quest for the philosophic

unification he envisioned. He orchestrated the spirit of U.S. pragmatism and the idea of progress with the democratic experience through education. Yet in his own time and to this day, philosophers would question Dewey's abiding focus on education, as though that would be delimiting to his perspective and influence. But Dewey's ready answer was that the field of philosophy could be viewed as a general theory of education. Yet to this day it is not uncommon for an undergraduate student majoring in philosophy at a first-tier U.S. university not to have undertaken the study of Dewey and his experimentalist philosophy.

### **Progressive Education as Part of the Social Transformation**

In his autobiographical essay, Dewey made mention of his growing awareness of the great industrial and commercial transformation taking place in the United States at the time he was a student at Johns Hopkins. Little did he know that he would become a major figure in the transformation through his influence on U.S. educational theory and practice. Early on in his career, Dewey recognized that a democracy requires a vital connection between school and society and that this connection is borne through the child's experience through the school curriculum. The beginnings of this awareness by Dewey likely stem from his experience as a high school teacher after his graduation from the University of Vermont. Following completion of his doctorate in 1884, Dewey took an instructorship in philosophy and psychology at the University of Michigan. From there he taught briefly at the University of Minnesota. At Michigan, Dewey's interest in education, and more specifically in the school curriculum, expanded and intensified as he served on a faculty committee evaluating the high schools of the state.

### **Institution Building**

In 1894, Dewey was invited by President William Rainey Harper to move to the newly opened University of Chicago to head the department of philosophy, psychology, and pedagogy. As founding president of the university (chartered in 1891 and opened in 1892), Harper worked vigorously in building the university as a leading center of

research and scholarship. Harper shared with Dewey an abiding commitment to the public schools and the advancement of education as a field of university study. Dewey's work at Chicago was to prove fateful in his direct involvement and influence on the school curriculum and on the field of curriculum studies.

Only 2 years after his move to Chicago, the University Elementary School was opened as the Laboratory School in Dewey's department. Two Chicago secondary schools were combined as the University of Chicago Secondary School in a newly established School of Education, and in 1901, a practice-demonstration school was incorporated into the School of Education under the directorship of Colonel Francis Parker. In remarkably short order, under Dewey and Parker, the university could lay claim to having created one of the nation's greatest and most comprehensive centers for education studies.

### The Dewey Laboratory School

From his studies of children and the development of the curriculum at his Laboratory School (the Dewey School), Dewey gave public lectures to raise interest and support for the Laboratory School. The lectures were published under the titles *The School and Society* and *The Child and the Curriculum*. Both short books were written with remarkable clarity and insight into the creation of a curriculum attuned to the nature and needs of the child and to the democratic prospect for society. Both works have remained in publication to this day and continue to be relevant to the contemporary education situation. For example, in *The Child and the Curriculum*, Dewey actually identified and described the developmental stages of the child beyond infancy and connected the stages to the needed structure and function of the curriculum. Dewey anticipated not only Jean Piaget's theories by decades, but also a host of progressive reforms that were to take place in education over the course of the new century.

Dewey's identification and explication of the needed congruence of the fundamental factors in the education process serve as a curriculum paradigm to explain why so many education reform efforts fail. Put simply and directly, the structure and function of the school curriculum must be in

harmony with the nature and needs of the learner and the democratic prospect (the principles and processes that undergird U.S. democracy). Otherwise, the consequence is the child versus the curriculum, individual nature versus the social culture, and the fragmentation of the curriculum into conflicting and competing parts for priority—factors that guarantee the failure of any reform effort.

In establishing the Laboratory School, Dewey went to lengths in *The School and Society* to explain the needed laboratory or experimental conditions that would provide unhampered investigation with the support of needed resources. He was concerned that the conditions required of a laboratory school would be misinterpreted as ideal or impractical. He drew a parallel with the function of the laboratory in science and industry, which requires controlled conditions unlike existing practices.

Dewey's work at Chicago was abruptly cut short by a falling out between Dewey and Harper on the role of the Dewey Laboratory School and the Parker Demonstration School. The dispute likely stemmed from the actions of the dean of the School of Education to promote the latter as the University Elementary School when in fact that was the name given the Dewey school at the time of its establishment. The administrative problem soon caused confusion on the part of parents and the public and resulted in the reduction of funds for Dewey's Laboratory School. As a result, Dewey resigned his post at the University of Chicago in 1904 to join the faculty in philosophy at Columbia University.

### Child Study

Dewey's Laboratory School and *The Child and the Curriculum* gave impetus to the child-study movement, which was seen by Dewey as nothing less than Copernican in realization and impact. But early on, Dewey warned against child centeredness in the absence of a carefully planned curriculum representing an environment to stimulate and nourish thought in ways appropriate to child development. He anticipated that many parents and even progressive educators would strip the curriculum of unsettling social ideas in the quest for a kinder and gentler school to the extent that the child be free to determine the curriculum. Dewey

held that nothing can be developed from nothing, for even a philosopher cannot spin a universe of truths out of his own mind, let alone a child.

In contrast to the emptiness of this romanticism, the crisis of the Great Depression found other progressives embracing social reconstructionism by recasting the school and the curriculum as a direct instrument for social reform. To Dewey and his fellow experimentalists, this reconstructionism would be nothing short of indoctrination—anathema to democracy.

### Progressive Education and the Idea of Progress

Dewey lived to see many of his ideas, once regarded as visionary and even revolutionary, become accepted practice—from the high school as a selective academic institution for the few to a comprehensive school encompassing a diversified curriculum for all, from rote and recitation to reflective thinking and application, from discipline by external control to discipline as responsible self-direction, from a subject curriculum to a correlated and integrated curriculum, and from subject matter as a body of fixed content to subject matter as the outcome of investigative methods for transforming the control and uses of knowledge for the growth of the learner in life. Yet he realized that these reforms were only transformations and signs of progress, not permanent accomplishments—for progress is an unending process in building democracy.

### False Dichotomies

Throughout his life, Dewey attacked the common penchant for dualistic thinking that creates oppositions and conflicts and that only serves to restrict inquiry and synthesis needed for problem solutions—such as the dualism between culture and utility, or the separation of the so-called cultural or academic studies over the practical studies, when in the reality of democratic society the vocational studies are cultural. He pointed to the dualistic fallacy between content or subject matter and methods that had plagued the curriculum field.

Dewey pointed out that subject matter is the outcome of method (inquiry). Physics, for example, is not a dead body of subject matter, but a method of investigating physical phenomena

ranging from the behavior of subatomic particles to the universe itself.

One of the dangers of separating curriculum and instruction has resulted in the focus of the field of supervision of instruction as separate from curriculum. The consequence has been instructional supervision, which regards the role of the teacher as concerned with delivery of curriculum and with the curriculum as being set by policy from above. In reality, it is the teacher who makes or breaks the curriculum, contended Dewey.

### Democracy and Education

Dewey was not seeking compromise, but insight into dissolving the dualism of conceptual and practical connections for problem solutions. Hence, for example, a system of universal or mass education is superior in quality to a system of selective education because the inclusive system provides more opportunity for social improvement and democracy, and it dissolves the traditional dualism between the cultural and the vocational and between a leisure class and a working class. In this connection, he fought together with other progressive educators for the creation of a uniquely U.S. high school encompassing a comprehensive curriculum for a cosmopolitan pupil population as opposed to the European-style dual system separating the academic from the vocational. His definitive work explicating his experimentalist philosophy, *Democracy and Education*, systematically revealed how the broad fields of knowledge as expressed through the school curriculum must connect vitally with the U.S. democratic prospect.

Another dualism attacked by Dewey is that of freedom and discipline. For Dewey, self-discipline or self-direction in the context of social responsibility, whether in the classroom or society, enhances freedom. The dualism between freedom and security has been raised in contemporary times with the U.S. people told by their leadership that certain civil freedoms must be sacrificed for the sake of national security. This issue was anticipated by Dewey who held that freedom is the voice of democracy. With regard to the school, the teacher must be free to teach if children are to be free to learn. With regard to society, democratic ends cannot be realized through dictatorial means. In pointing to the fallacy

of the ends–means dualism, Dewey held that freedom of inquiry and communication enhance security for a free society, whereas restrictions on inquiry and communication only undermine the prospects of a democratic social order.

### Reflective Thinking

The unifying process for the curriculum was seen by Dewey as manifested through reflective thinking for problem solving. In *How We Think*, Dewey addressed the ways through which teachers could transform the curriculum by engaging the learner in the processes of problem solving through scientific attitude and methods, as contrasted with traditional rote and recitation.

By means of reflective thinking or scientific inquiry, decisions on social problems would be acted upon by means of the best available evidence continually held tentative pending the outcomes of further investigation and verification. Reflective or independent thinking is the key to the release of intelligence—as opposed to dogma, dictate, or blind traditions that hamper intelligence and progress. With regard to the alleged dualism between inquiry and emotion in scientific thinking, Dewey held that investigation is indeed served by inspiration no less than in the arts.

### Other Dualisms

Dewey and his fellow experimentalists rejected the dualism between heredity and environment. Influenced by Darwin, they viewed the two forces as necessarily interactive and held that through education humanity can shape environmental conditions. Dewey and his fellow experimentalists championed environmentalism generations before it became the trend in the social sciences. They opposed social Darwinism of survival of the fittest on the grounds that through education, humanity can control its destination rather than being under control of natural or man-made conditions that hamper intelligence and progress.

Other false dichotomies exposed by Dewey were those relating to thinking and doing, mind and matter, science and humanities, cognitive and affective, theoretical and practical, aesthetic and utilitarian, form and function, science and morality, and competition and cooperation.

### Progressive Education as Progress in the Making

Dewey's last published statement appeared shortly before his death in 1952 at the age of 93 in the introduction to a book by Elsie Clapp—a moving account of the building of progressive schools in Appalachia serving a destitute population suffering from unemployment, hunger, and disease in abandoned coal-mining communities during the Great Depression. In his statement, Dewey addressed the organized attacks on the achievements of progressive education that were becoming frenetic and widespread. He pointed out that progressive education was part of the wider social movement for the improvement of the human condition and that no education is progressive unless it is making progress.

## DEWEY LABORATORY SCHOOL

---

The Laboratory School of the University of Chicago—commonly known as Dewey's Laboratory School,

in tribute to John Dewey's role as its founder, director (1896–1903), and philosopher-in-chief—had a two-pronged function: (1) to cultivate an active and supportive learning community in which the social and intellectual needs and capacities of children could be met and (2) to make discoveries about learning, teaching, subject matter, curriculum organization, discipline, and administration by applying educational theory to practice in an experimental setting. As both an elementary school where children were educated and a university department where scientific investigations were conducted, the Laboratory School had as its constant purpose the fostering of curiosity, inquiry, learning, and growth among students and educators alike. Just as the school created for its students a society-in-miniature where they could learn to solve real-world problems experientially and cooperatively, so too did it provide for its educators an idealized school setting in which they could tinker toward educational innovation experimentally and collaboratively. Indeed, what made the Laboratory School characteristically Deweyan was its fusion of educational means and ends: from the harmonization of the psychological and social factors of learning, to the integration of subject areas, to the unification of method and content in the curriculum, and more.

Dewey's pedagogical theories were by no means fully formulated when the Laboratory School opened in 1896. In fact, some of the strategies he experimented with were simple adaptations of various approaches being tested at comparable lab schools in Europe or in progressive public schools in the United States. Chief among the philosophical influences on Dewey's work were the ideas of Friedrich Froebel, who posited that a school's primary responsibility is to teach children to live cooperatively, that children's activities and play are capable of educational use, and that the school should reproduce on the child's level the typical doings of the mature society. Dewey's realization that some of the most important elements of his own early education were obtained outside the classroom also had a significant impact on his emerging curriculum thought. Finally, Dewey envisioned his school as a place that would release children from the tedium of the typical turn-of-the-century classroom, where lecture and recitation were the norm.

The Laboratory School attempted to embody the ideal of the school as an embryonic society in which children would gain social experience and insight, as well as intellectual and manual skills, by participating firsthand in the activities (referred to as occupations) fundamental to the workings of the home and the larger community. In Dewey's view, engaging in society's occupations would stir the imagination of children who inherently are concerned with whatever adults are concerned with. Rather than merely mimicking adult tasks, however, the occupations would be authentic ends in themselves. For example, when learning history, students would recreate the activities and circumstances of the historical actors they were studying so as to develop historical empathy and social insight, or they would engage in problem-solving activities so as to conceptualize how concrete social problems might be addressed in the past, present, and future. In this scheme, education was none other than life.

In the Laboratory School's first years, the curriculum had two dimensions: the children's side, consisting of activities, and the teachers' side, consisting of subject matter. Dewey ultimately determined through experimentation that carefully planned activities not only helped students amass practical information and skills in various subject areas (e.g., cooking teaches about chemistry, arithmetic, botany, zoology, culture, and manual arts), but also awakened in children their natural propensity toward formal inquiry. Thus, while an integrated curriculum was appropriate for introducing young children to the holistic fashion in which real-world activities are carried out and problems are addressed, a more specialized kind of curriculum organization was appropriate for mature students whose interests might lie in pursuing the conventional subject disciplines—history, geography, literature, foreign languages, science, mathematics, music, and art—in depth. Although there was a prescribed curriculum with certain knowledge and skills that all children needed to learn, there was also flexibility for students to pursue their interests beyond the curriculum's scope. In other words, there was always room for growth at Dewey's Laboratory School.

## DIDACTICS—DIDAKTIK— DIDACTIQUE

---

The relevance of the topic is linked to a growing international rapprochement within the curriculum field, making necessary understanding regarding differing traditions of the planning of teaching and learning. One may say that there exist two main traditions: the Anglo American tradition of curriculum studies and the Continental and North European tradition of didactics. Although the curriculum studies tradition is internationally acknowledged, adopted, and adapted, the tradition of didactics is still relatively unknown in English and U.S. curriculum contexts and settings.

The word *didactics* originates from the Greek *didaskein*, which meant to be a teacher or to educate. As a word used in English, it has a rather negative connotation. It is, for example, found as an adjective meaning to behave like a teacher. The term is generally avoided in English and U.S. curriculum contexts. In Nordic (*didaktikk/didaktik*), German (*Didaktik*), and French (*didactique*) contexts, the word is used only to a limited degree in common language, while it is in educational contexts one of the most central ones. It has, however, when applied professionally, a variety of meanings. An unambiguous understanding of the subject matter, scope, methodology, and system of didactics as part of education as a scientific discipline does not exist. Differing schools, traditions, and models may be clearly discerned. There exists consequently a variety of definitions that all claim to be legitimate both historically and in contemporary contexts. Some definitions focusing on the field and scope of didactics according to Friedrich Kron are as follows:

- Didactics as a science and theory about teaching and learning in all circumstances and in all forms

This definition is the most comprehensive and widest.

- Didactics as the science or theory of teaching

Didactics defined in this way comprises the broad sphere of reality consisting of socially legitimated and organized teaching and learning processes accomplished on a professional foundation.

- Didactics as the theory of the contents of formation and of its structure and selection

This understanding of didactics focuses formation and the formation potential of subject matter.

- Didactics as theory about the steering and controlling of the learning process

In this understanding, teaching and learning processes are regarded as analogues to cybernetically controlled technical systems.

- Didactics as the application of psychological teaching and learning theories

Within this understanding, the research aspect is predominant. The leading research interest is the bettering of all factors related to teaching and learning.

Today in French, German, and Scandinavian educational contexts there is a marked tendency to include educational practice as part of the concept of didactics where the term is viewed as the theory and practice of teaching and learning.

Simplified we may say with Rudolph Künzli that the concern of didactics is as follows:

- What should be taught and learned (the content aspect)?
- How do we teach and learn (the aspects of transmitting and learning)?
- To what purpose or intention should something be taught and learned (the goal/aims aspect)?

Another way to put it is as follows: As a real phenomenon in these educational contexts didactics exists

- as theory and as prescription—and consequently as reflection and action—underlining differing

theories and models of didactics with their different foci and views of its scope and function;

- as different levels of abstraction, such as, for example, general didactics, special didactics, and school subject didactics; and
- as a scientific discipline, as a research area and as courses of study—that is, the institutionalized aspect.

These are, however, analytic categories; as real phenomena they overlap. One can, however, at least identify three levels as core areas of didactics:

- a theoretical or research level, where the expression denotes a field of study;
- a practical level, where didactics is exercised, comprising, among other fields, the fields of teaching, curriculum making, and the planning of teaching and learning; and
- a discursive level, where didactics implies a frame of reference for professional dialogues between teachers and between teachers and other interest groups discussing school matters.

Institutions naming the core of their activities “didactics” may be found in the fields of educational research, teacher education (departments of general didactics and subject matter didactics), school administration, as well as inservice training contexts, just to mention some.

## DISCIPLINE-BASED CURRICULUM

The curricula in most formal educational systems of developing and developed countries are divided into separate and distinct subjects or disciplines, such as science, mathematics, literature, social studies, and the arts. In the curricula, school children are expected to concentrate on a single field of study, possibly supported by several courses in closely associated disciplines. Curriculum theorists refer to such curricula as discipline based. The term discipline based covers the full range of distinct subjects or fields of study, including the more traditional usage in areas such as mathematics or physics; in areas of study with a strong professional focus, such as molecular biology; and in newer areas of study, such as media education.

In a discipline-based curriculum approach, the courses that provide students with a foundation in the subjects or disciplines are critical to the curriculum. Students must have frequent and recurring opportunities to practice their disciplinary skills throughout their fields of study in a way that allows later courses to build on the work of earlier ones. Assuming that certain core skills and competencies are absolutely essential for practice any time and anywhere, curricular emphasis is laid on the teaching and assessment of essential knowledge, skills, and competencies throughout the course of distinct subjects or disciplines.

The instructional emphasis of discipline-based curriculum tends to be on specific, current, and factual information as it emerges from the disciplinarians. A discipline-based curriculum approach characterizes teaching practice within one subject and encourages teachers for specialization, depth of content knowledge, and integrity to the conventions of their discipline. For teachers, disciplinary affiliation plays a primary role in professional engagement for the development and distribution of good practice in teaching and learning. Content area teachers tend to see reality through the lenses of their subjects or disciplines. Reasonably, the content area teachers are generally convinced that their perspective is the most important one. In the absence of criteria for resolving disagreements over which knowledge is of highest value, curriculum tends to be shaped by institutional politics.

In general, a discipline-based curriculum approach encourages teachers to plan a series of connections to control the way the students come into contact with the subject matter. By doing so, teachers are expected to make the main ideas and issues more accessible to the school children. In a discipline-based curriculum approach, classroom instruction is generally concerned with sequencing resources, moving from rule to example, and thereby focusing on task analysis, teaching hierarchies, the use of drill and practice activities, and finally, testing the accurate recall of disciplinary knowledge. This static and generally linear model of teaching and instruction characterizes the nature of classroom practices in most traditional discipline-based curricula. It is teacher centered and promotes a high degree of accountability for the memorization and recognition of disciplinary knowledge and display of skills and behaviors that constitute most of the traditional, teacher-proof curriculum. However, this model of teaching and instruction does not allow school children to explore, reconstruct, and create authentic classroom products and activities.

Many curriculum theorists argue that the discipline-based curriculum limits students' learning to narrow aspects of content knowledge and does not allow for real-life explorations and learning of issues of interest to school children. A traditional, discipline-based curriculum assigns students with passive, information-storing rather than information-producing roles. In rare hands-on classroom activities, school children tackle reality in all its rationally invigorating complexity. In most courses, however, students simply read or listen to "expert" view as it comes out from the textbook and teacher and try to remember it long enough to be successful on exams. The only competency demanded is to recall. Rarely does discipline-based curriculum require students to explore, analyze, classify, synthesize, or engage in high-level thinking processes.

## DIVERSITY

---

The term *diversity*, initially associated with the field of anthropology, refers to cultural, human, and social differences. Popularized beginning in the 1960s as a result of the civil rights movement, diversity has become an umbrella term for people of various backgrounds who have faced exclusion and discrimination—both from individuals and from institutions—for political, economic, and social reasons and/or because of stereotypes and biases about their particular group. Originally used to refer principally to people of color and women, more recently the term has been broadened to include ethnicity, national origin, native language, sexual orientation, social class, religion, cognitive and physical ability, age, and other differences. Remedies for discrimination and exclusion have ranged from affirmative action in recruitment and hiring, to special programs to educate the wider community about social and human differences. In education, curriculum reform has been at the center of approaches to diversity.

### Who Is Included Under the Term *Diversity*?

Most organizations, including schools, universities, and corporations, now recognize and attend to issues of difference through recruitment and retention and professional development, as well as through other activities meant to enhance the climate of a diverse community. Until quite recently, most organizations viewed diversity as a rather narrow set of differences, usually limited to race and ethnicity. Outreach efforts and internal programs (promotion, staff development, etc.) generally focused on groups labeled by the federal government as underrepresented, that is, women, African Americans, Latinos/as, Native Americans, and in some cases, Asian Americans.

Although the federal legal definition of underrepresented is still limited to race/ethnicity, gender,

and more recently, physical and mental disabilities, since the 1980s the term diversity has expanded, at least in some arenas, to either explicitly or informally include a broad spectrum of demographic, experiential, attitudinal, and philosophical differences. The focus of efforts to address diversity has been to create more hospitable and accepting organizations through the development of awareness and understanding of differences, and the promotion of inclusiveness and learning of all within the organization. This focus is especially true in education in general and in curriculum in particular.

### Curriculum and the Conundrum of Diversity

Although there is little argument with the fact that diversity exists and has been a reality within the United States since its very beginning, approaches to diversity have varied greatly. Consequently, how to think—and what to do—about diversity has always been a contentious matter. In fact, because the question of power is central to matters of diversity, it can be said that all the great debates and struggles in curriculum in the past century and a half in the United States have centered on matters of diversity in one way or another. In the United States, the motto *E Pluribus Unum*, or *out of many, one*, has been interpreted in numerous and often contradictory ways. Although this ideal is based on the belief that the nation must be simultaneously supportive of pluralism and dedicated to unity, how to balance these sometimes conflicting values has been a hotly contested issue throughout U.S. history.

From the idea that people of all backgrounds should form a melting pot, to battles over whether English should be the official language of the nation, the history of the United States is replete with examples of vastly different approaches to what some have seen as the problem and others as the promise of diversity. For some, *E Pluribus Unum* has meant the complete assimilation of newcomers to the nation, particularly through what has been called Anglo conformity—that is, the wholesale adoption of the language, culture, traditions, behaviors, and ideals of the nation's dominant group, including dropping one's native language, culture, and allegiance to other nations. For others, *E Pluribus Unum* has meant a more gradual adaptation to the new country, or what

has been called the melting pot, where some cultural manifestations (usually music, food, and other tangible expressions of culture) may become part of the common culture. For others still, it has meant the even more gradual incorporation of newcomers into the nation, with immigrants and their offspring encouraged to maintain their native language and ethnic ties while they are learning English and adapting to the culture of the host nation. This approach has been called cultural pluralism. The differences among these three approaches for dealing with diversity are sometimes quite stark and at other times nuanced.

As a result of the differing views of *E Pluribus Unum*, official and unofficial policies and practices related to diversity have veered from one extreme to the other and everything in between. In addition, trying to square the ideals of democracy and inclusion with the reality of the nation's history of racism and oppression—from the near extermination of Native Americans to the enslavement of Africans and other actions throughout our history—is what Gunnar Myrdal, in his groundbreaking study of the lives of African Americans in the 1940s, termed the American dilemma.

Another, and related, defining ideal of the United States dating to the founding of the U.S. common school in the mid-19th century is the belief that public schools can and should be, in the words of Horace Mann, the great equalizer. Mann, a key player in the push for universal, free, and compulsory education, believed that students, regardless of social class, ethnic, or cultural background, should share equally in the benefits of a public education. John Dewey, the noted educational philosopher whose work was emblematic of the Progressive Era in education, also believed that schools needed to serve all students regardless of station, rank, or diverse circumstances of any kind. It is this belief that has led to some of the quintessential battles over public schooling from the 19th century to the present, including struggles over desegregation, integration, busing, bilingual education, multicultural education, and others.

### Responses to Diversity

A number of approaches have been used to address discrimination based on race, ethnicity, gender, and other differences. These have ranged from

affirmative action to correct past inequities; to systemic changes at the institutional, local, and national levels; and in the case that interests us here, to specific curriculum reform efforts.

### *Affirmative Action*

Affirmative action is the process of actively seeking and recruiting individuals from underrepresented groups for postsecondary education as well as for employment in public and private organizations. Most often associated with the civil rights movement, affirmative action came about as a result of demands by the victims of discrimination, especially women and people of color, for equity and retribution for past ills. Later, persons with physical and other disabilities also demanded to be included under the protections afforded by affirmative action. Although formal affirmative action has become less visible in the past decade than it was in the 1970s and 1980s, primarily due to court cases at the state and federal levels challenging this practice, many private and even public institutions are more aware than ever of the benefits of having a diverse student body and workforce in their organizations. Consequently, efforts to recruit and retain a community that is more representative of our society as a whole continue in many organizations.

### *Institutional Changes*

In the past half century or so, institutions of all kinds from schools to colleges and universities, as well as private and public organizations, have engaged in systemic changes to develop a more welcoming climate for all people. Many of these changes have come about not through actions initiated by the organizations themselves, but rather as a result of pressure from those both inside and outside these institutions to remedy inequitable conditions. At the K–12 level, efforts have focused on such issues as the desegregation and integration of schools, as well as on curriculum reform and professional development centering on issues related to diversity.

The rapidly increasing diversity of the student body since the 1980s has resulted in over 40% of all students in U.S. public schools being currently from backgrounds other than the mainstream—that is,

they are non-White and/or non-English-speaking. Most teachers, however, are White and English-speaking, and many have had little personal or professional experience with people of diverse backgrounds. Given that our society remains quite segregated in terms of residential and schooling patterns, the same is true of teachers of color who, although they may be aware of their own identities, may not necessarily know much about students of other backgrounds. Consequently, it is imperative that all educators, regardless of their own backgrounds, effectively learn to teach students who are different from themselves.

Although some institutional changes have been made in schools, colleges, and universities, not all changes have proved positive nor have they been consistently developed or implemented. In K–12 education, institutional reform has included detracking to ensure more equity in student choice of courses, culturally sensitive disciplinary policies, and preservice and professional development to incorporate culturally responsive pedagogy into teachers' practices. In higher education, changes have centered on providing a more culturally diverse curriculum and the recruitment and retention of a more diverse faculty and student body. Here, too, the changes have been sporadic and uneven.

In teacher preparation programs as well as through inservice programs, teachers and other education professionals have received information and resources related to diversity and they have learned specific approaches for teaching students of diverse racial, cultural, and linguistic backgrounds. Nevertheless, many new teachers still maintain that they have not been adequately prepared to teach a diverse student body, especially students whose race, ethnicity, language, and special needs differ from the mainstream. At the same time, more rigid accountability structures implemented since the passage of the federal No Child Left Behind legislation in 2002 have constrained professional development activities, resulting in less attention being paid to diversity, and fewer resources spent on it.

In K–12 public education, a particularly thorny issue has been the achievement gap—that is, the widely differing achievement levels of students of different backgrounds. The achievement gap is especially evident between European American (White) students and African American, Latino/a,

and Native American students, as well as some students of Asian American backgrounds. In recent years, the gap has been somewhat reduced as a result of more stringent national standards and high-stakes standardized tests, but some critics maintain that this reduction has come about at too high a price—that is, through the constricting of the curriculum and the curtailment of teacher and student creativity in the service of higher test scores.

### *Curriculum Reform*

In the specific case of curriculum, particularly in K–12 public education, approaches to diversity have ranged from efforts to Americanize students (a term popular at the turn of the 20th century when immigration from Europe was at an all-time high, but no longer in favor, although such approaches are still evident in efforts to assimilate newcomers, or the campaign to make English the official language of the United States) to the opposite approach of providing native language classes to help students make the transition from their native language to English. In the K–12 curriculum, Americanization included everything from teaching cleanliness and social skills to mandated courses in English, American literature, and U.S. history. Probably even more significant than the expressed curriculum were efforts to Americanize students (and, often, their families) through the hidden curriculum as seen in such practices as Americanization classes and patriotic celebrations of U.S. holidays and heroes.

Creating a healthy and productive learning environment for all students is at the heart of curriculum reform efforts addressing diversity. The impact of attending to diversity in curriculum is clearly evident in content and pedagogy at all levels of education from early childhood to doctoral studies, as well as in the contentious debates about how diversity should best be addressed. An example is the philosophy and practice of bilingual education—that is, using students' native language along with English—to teach curriculum content. Although the latest iteration of bilingual education started in the 1960s, educating children through the use of their native language while they were also learning English has a much longer history in the United States. For instance, bilingual instruction in German and English was quite common in

the Midwest in the 1800s and before the end of the 19th century, the same was the case with Polish, Italian, Norwegian, Spanish, French, Czech, Dutch, and other languages. Nevertheless, bilingual education remains a controversial issue and it has been eliminated in a number of states since the 1990s. Another example of how diversity in curriculum has been contested is the diversification of the canon, particularly at the university level, with opponents charging that such diversification has destroyed the Western canon and even the very foundations of U.S. society.

In the past several decades, the concern for equity in education has been epitomized most clearly through multicultural education, a field that has focused on curriculum reform, inclusive pedagogical strategies, and institutional change. Other related and parallel movements, including ethnic studies, bilingual education, global studies, social justice education, multicultural teacher education, and critical race theory, have also had a significant impact on curriculum in K–12 and higher education. Concentrating on such issues as racial and social class segregation, the disproportionate achievement of students of various backgrounds, and the structural inequality in both schools and society, all of these approaches and philosophies are directly related to a concern for diversity.

## DIVERSITY PEDAGOGY

---

Inspired by the civil rights movement in the 1960s, diversity pedagogy emerged in response to the controversial early works that viewed ethnic minority and poor children as deficient due to cultural, language, ethnic, and economic differences. A diversity ideology in education can be defined as structures of visionary thinking or sets of beliefs, attitudes, ideas, opinions, assumptions, and theories that (a) address cultural, social, economic, and political context and curricular content of schooling and (b) examine human developmental issues, social and cognitive growth affecting individual, and group differences in the teaching–learning process. Theoretically, diversity ideologies improve the learning experiences of all children. They are especially concerned with a curriculum that includes relevant content and ensures access to equitable (fair and impartial) schooling opportunities for underserved students. Underserved children include students from ethnic minority groups, immigrant children, students whose home language is not U.S. English, and most children who attend high-poverty, underperforming schools. Diversity pedagogy is a diversity ideology developed by Rosa Hernández Sheets that focuses on the natural and inseparable connection between culture and cognition in the teaching–learning process. It can be considered one of five major diversity ideologies. The other

four major diversity ideologies—multicultural, antiracism, critical pedagogy, and critical race theory—primarily use a sociological foundation to address on the social, political, economic, and legal context of schooling. This entry introduces diversity pedagogy theory (DPT) and describes its structural aspects.

DPT provides educators with an organized set of pedagogical tools to help develop open-minded dispositions, gain a culturally inclusive knowledge base, and learn culturally responsive teaching strategies. It links culture, cognition, and schooling in a single unit. It unites classroom practice with a deep understanding of the role culture plays in the social and cognitive development of children. DPT views the natural connectedness of culture and cognition as key to incorporating multiple factors of diversity in the teaching–learning process. It acknowledges the indissoluble, joint role of culture and cognition in the human developmental process. Diversity pedagogy also recognizes the powerful, active role students play in their learning.

Structurally, DPT has eight dimensional elements. Each dimension has two interrelated parts: teacher pedagogical behaviors (TPB), which describe how teachers think and act in the classroom, and student cultural displays (SCD), which show the ways children express who they are and what they know. These two paired, side-by-side, tightly interconnected dimensional elements in eight dimensions serve to guide teacher and student behaviors. The eight dimensions are diversity–consciousness of differences, identity–ethnic identity development, social interaction–interpersonal relationships, culturally safe classroom context–self-regulated learning, language–language learning, culturally inclusive content–knowledge acquisition, instruction–reasoning skill, and assessment–self-evaluation

The eight dimensions are not hierarchal, do not take place in isolation, or occur in a given order. One dimension is not more important than another and one does not have to be mastered before another. In the classroom, the eight dimensions naturally intersect with each other. Teachers rarely behave in only one dimension and children will not demonstrate a single dimension. DPT theorizes that teachers who consistently recognize, interpret, and respond to student cultural displays have more opportunities to respond to students’

academic, language, social, ethnic, and cultural needs. These teachers are more likely to consider the diverse characteristics, strengths, and competencies of their students. Awareness of student cultural displays increases the probability of teacher potential to support social growth, enhance ethnic identity development, maintain heritage language, and promote self-regulated behavior. This type of teacher behavior also makes meaningful connections between students' prior cultural patterns of knowledge to the intended acquisition of new knowledge.

## DOCUMENTARY RESEARCH

---

The methodological research approach termed *documentary research* has multiple meanings and different usages within the broad research landscape across disciplines. Although the term is commonly used within the field of sociology—even cited as one of the most common forms of research conducted by sociologists—for research that leverages archival documentation including texts, documents, newspapers, films, photographs, governmental publications, census data, paintings, diaries, journals, and books, its meaning within the field of curriculum studies, albeit related, is different. Whereas sociologists focus on these various documents as sources of data and as reliable artifacts when conducting their research, the field of curriculum studies sees documentary research as the art and science of producing the documentation itself. This act of doing documentary research can

be conducted through producing written accounts, photography, recordings, or film of various phenomena in the social world. Documentary research in curriculum studies is a form of aesthetic, arts-based inquiry. To those interested in documentary research within the curriculum studies field, the writers, photographers, interviewers, and filmmakers act as researchers explicitly attempting to develop their craft in order to portray a view of reality. These people conducting documentary research, often referred to as documentarians or documentarists, have interest in detailing what exists in the social world by revealing what they consider to be the actual state of affairs in sites, environments, or other places of interest.

Both the fields of sociology and curriculum studies draw on the term *docere*, the Latin word for “to teach,” as the basis for what is occurring in this form of research. The research that results is presented to inform others about a particular way of life, group of people, or event. In addition, both fields of study look for proof through various pieces of documentation (in any of its multiple forms) as evidence that this something exists. In curriculum studies and other related educational fields, however, the foundation of documentary research goes beyond simply using the documents as sources of data; the intention for this form of research is to take action in order to inform through the construction of a document. These documents, commonly referred to as a documentary, suggest particular meaning. The resultant creation or portrayal attempts to reveal authentic events or situations in believable and realistic ways. Through various forms of representations, although the imagery through visual, auditory, and written form are favored, the documentary product of documentary research implies an attempt to discover or uncover what is real or what exists so that others can view it or engage with it. Because of this, documentary research presents a form of authentication about the events, situations, or the way of life that is documented. Through the creation of the documentary, the researcher puts together images through scenes, moments, or illustrations that assist in reconstructing what is occurring in the given phenomenon being studied.

Although documentary research within curriculum studies is related to the work of sociologists,

historians, anthropologists, and even journalists, documentary research within curriculum studies is not as interested in accumulating the same “proof” that something exists as is necessary or expected within these other fields primarily because curriculum scholars contend these kinds of finite representations do not exist. This is not to infer that the research is less rigorous or trustworthy than the approaches of the other disciplines, but it suggests that the story, social location, and positionality of the documentary researcher along with the narrative behind the constructed portrait, image, written account, or film is critical to conducting this form of research within curriculum studies. As this form of research works to portray some particularity or phenomenon, it seeks to document life in realistic and believable ways, but is cognizant that elements of objectivity and subjectivity are challenged by the very nature of engaging in this kind of research. The barriers or artificial lines of what is factual and what is interpreted get blurred as those engaged in documentary research try to discern meaning.

Although this attempt at a realistic appraisal revealed through the documentary may be precisely what the documentarian attempts to do through the research, inferred objectivity gets complicated in this form of research. A documentarian’s perspective and subjectivity are amplified when the reconstruction is developed and revealed to an audience. Rather than insisting on objectivity or arguing for an objective interpretation, documentary research in this form has at its very center the notion that constant interpretation and subjectivity is at play. Similar to the biases and subjectivity associated with ethnographic research, the documentarian, just as the ethnographer, has choices in the way that the work is presented and represented. The subjectivity and the location from where the documentary is produced is an integral, essential aspect of the research. What individual researchers bring to the table is a basis for understanding a particular phenomenon and is built into this form of research. The meaning that is made and the understandings that are conveyed through the images of documentary embrace the perspective of the researcher so that the interpretation of the phenomenon or hypothesis is framed from this standpoint. Although there is an attempt to be value free, there is nothing impartial about the representation that is developed and this is fully

acknowledged. Those engaged in this form of research take note of, and present what they present in the multiple forms written, photographed, recorded, and filmed accounts because of their experiences, education, ideological frames, and their worldview.

## DU BOIS, W. E. B.

---

Known as a sociologist, philosopher, historian, and activist, William Edward Burghardt Du Bois (1868–1963) was also one of the preeminent scholars of the 20th century whose work greatly influenced the field of education and curriculum studies. His polemics and lifelong advocacy of liberal, progressive, and reconstructionist views provided thoughtful critique as it deepened our collective understanding of school knowledge, race, and power for those working in the field of curriculum studies.

Du Bois entered Harvard University in 1888 as a junior. At Harvard, he earned a second BA and enrolled in graduate school, studying under legendary professors William James, Josiah Royce, and George Santayana. After receiving his master’s degree in 1891, he studied at the University of Berlin and then returned to Cambridge to become the first African American to earn a PhD from Harvard.

Leaving a professorship at Wilberforce University in Ohio, Du Bois moved to Atlanta University

to teach economics and history, during which time he published in 1903 a compilation of unpublished papers titled *The Souls of Black Folk*. This work includes one of his most quoted statements that the problem of the 20th century is the problem of the color line. In *The Souls of Black Folk*, he challenged Booker T. Washington, opposing accommodation, gradualism, and industrial education. He called instead for more liberal education and social agitation to break the bonds of racial oppression.

Du Bois helped organize the First Pan-African Congress and the National Association for the Advancement of Colored People (NAACP). His celebrated books on race issues include *Dark Water: Voices From Within the Veil*, *Black Reconstruction in America*, *Black Folk Then and Now*, *Dusk of Dawn*, and *Color and Democracy*. In 1940, he created *Phylon*, a journal of social science, published at Atlanta University. The indefatigable scholar-activist continued to develop his views, especially his critique of U.S. capitalism and racial inequality. Cold war politics and hysteria targeted Du Bois as he ran for public office and joined forces with the international peace movement.

### On Education and the Curriculum: A Legacy

Committed to social change, Du Bois, the radical democrat, as he was occasionally called, believed in the power of ideas to transform and reform. He wanted the curriculum to have a social point of view. He rejected medieval knowledge, believing that the pressing racial, economic, and political inequities mandated that school knowledge for all people consider the interests of equity, democracy, and justice.

Du Bois is forever wedded to the talented tenth concept, which advocated that the top 10% of African Americans should obtain higher education to develop their leadership capabilities and to create opportunities for other Blacks. Criticized by some as elitist, his obsession with intellectual training must be understood. He noted that a people not far removed from chattel slavery must be trained to participate in social and especially political life. Knowledge was the first step to progress, and only a select few were prepared, he believed, to engage higher intellectual training. Their pupils would

then see the world through their eyes. Intelligence, he believed, was social power.

As a curricularist, Du Bois held strong views about school knowledge and instruction aimed at African Americans. He opposed the Hampton model, which advocated industrial education, believing it reinforced subservience. It was a gift to the industrialists and vested wealth. He, however, was not opposed to vocational education for occupation. He fiercely promoted a liberal curriculum that featured the social sciences and humanities. For him, all individuals, especially teachers, must learn about history, politics, economics, geography, physics, classical literature, mathematics, and poetry. He wrote that the teacher of blacksmithing should also be a person of education and culture acquainted with the modern organization of business in the world. Teachers of math, he noted, must also understand human interactions.

He extended his curriculum thinking beyond elementary and secondary schooling into higher education, especially the Negro college. The Negro college, he believed, must be a place of unfettered inquiry. He wrote of the college-bred Negro and the mandate on the Negro college to participate, in fact, serve as a command post in the uplift of the race. The Negro college curriculum must break with the canon and include people of color in explaining the civilizing of the world. Fervent study was indispensable to the task. Articulating and demanding academics in the Black college occupied much of Du Bois's life. He lamented that many Black college students were distracted by the values of indulgence and complacency over contribution to the collective libratory mission of the race.

Giving life to his curricular views, Du Bois wrote many courses, some cutting edge, on Black history, social science, and politics. At Atlanta University, for example, he wrote and taught a course titled Karl Marx and the Negro. Some view him as the father of Black studies.

Human agency was at the heart of Du Bois's educational and curriculum views. He advocated that the inquiry into injustice be wedded to practice. The school curriculum at every level must examine the unequal distribution of wealth, political economy, colonialism, national and international race relations, and other manifestations of tyranny and oppression. Beyond that examination, he wanted people to vote, protest, organize,

caucus, speak out, and commit themselves to social change.

### Du Bois: Black Social Reconstructionist?

Reflecting on his Harvard experience, Du Bois noted that he aligned himself with those who planned a new world. His sweeping views and activities took him far beyond the work of conventional curriculum theorists, yet he remained drawn to schools and school knowledge. His life coincided with the rise of curriculum as a field of study, but he is not claimed by the leading figures or the conventional literature. Scholars know he had brief brushes with John Dewey, for example, at the founding convention of the NAACP, but neither mentions the other. It can be argued that Du Bois, the democratic socialist, held views consistent with the radical wing of the Social Reconstructionists in the 1930s. Neither he nor they held out hope that industrial capitalism would relieve economic want and suffering.

From the outset, Du Bois believed in the transformative power of ideas. Earning a living must not be the sole objective of education. He wanted people, Blacks especially, to be worldly, assertive, and purposeful. He maintained that education must be liberatory; hence, it should be subversive,

and the curriculum should instill a sense that learning is power.

Like the reconstructionists, Du Bois believed teachers must be statesman and activists. They must do the world's work. Democracy must be central to the curriculum if Black people were to participate in the sociopolitical processes. Schools must impart knowledge that leads to action, social change, and uplift.

## EARLY CHILDHOOD CURRICULUM

---

Embedded within Enlightenment and modernist discourses of progress, linearity, dualism, and science, Western Euro-American constructions of childhood have dominated curriculum both as defined and practiced. These constructions have focused on human beings from birth to 7 or 8 years of age. The first section of this entry describes the basic influences and content of this dominant curriculum. The second section focuses on post-modern challenges to this universalist view of young children (or reconceptualizations of early childhood curriculum) and places diversity, critical multiculturalism, and equity at the forefront of early childhood curriculum. Finally, the last section briefly describes the most recent influences on curriculum as dominated by adults outside of early education from business groups to citizens who believe that education should be measured quantitatively and that even public education experiences should be competitive and follow business models that benchmark and label those who do not attain the appropriate score as failing.

### **Dominant Narratives of Early Childhood Curriculum**

The most commonly presented history of early childhood curriculum begins by tracing the progress of human beings through functioning as hunter-gatherers, through the construction of villages, then cities. In this predominantly Western

(mainly European and U.S.) history, those who are younger have been labeled as especially vulnerable. Although debates continue as to the frequency of the practices, younger human beings are described as experiencing abandonment, infanticide, and slavery and have been shown to work long hours in factories. Schooling was constructed for privileged young males who were taught reading and writing, or apprenticeships were created to teach occupations, most often from father to son. As objects of Enlightenment discourses used to construct fields of sociology and psychology, young children (and older children also) became the focus of a range of writers, some who actually practiced the curriculum perspectives that they put forward. As examples, in Europe, Martin Luther argued that all children should be taught to read the Bible. John Amos Comenius proposed that the first 6 years of life serve as the foundation of all knowledge and are best spent with the mother. Although sending his own five children to founding homes, Jean-Jacques Rousseau put forward a curriculum based on natural development, on learning about nature and the physical world, and on focusing on reasoned logic for a hypothetical child. In the early 1800s, Johann Pestalozzi used the work of Rousseau to construct pedagogical methods that he believed placed the child at the center of learning. His methods were expanded by his student Friedrich Froebel, who developed a clearly defined curriculum that he termed kindergarten that compared the child to a naturally developing seed who would grow into a mature fruit; his curriculum focused on play, but used

specifically designed three-dimensional materials (named gifts from God) with planned activities (occupations) that could be completed with the activities. The beliefs of these Enlightenment scholars have played a major role in conceptualizations of curriculum for young children even to this day, as is evidenced by the use of the term kindergarten for early childhood programs in a range of locations.

Although education and curriculum in general have been influenced by (a) the belief that poor parents do not usually provide sound knowledge and learning experiences for their children and (b) that the field of psychology can yield knowledge about how people think, understand, and learn, these beliefs have dominated mainstream curriculum for young children. Sigmund Freud's focus on the early years as determining adult functioning has literally been accepted in most types of theories ranging from the belief in critical periods for particular types of learning (therefore, the belief has been that curriculum must be presented at appropriate times, even critical times when a child is ideally ready) to philosophical lenses from which brain research is constructed to mother-blaming for problems in adulthood. As European males have constructed psychological theories about their own reasoned thinking, those who were younger became the objects of the explorations and described using developmental labels (domains) of progress that would advance from childhood to adulthood: physical, emotional, social, cognitive, linguistic, and so on. These labels and the theories constructed around them have literally been used to create curriculum goals, objectives, content and activities, and outcomes that are considered to contribute to a young child's developmental progress. Cognitive developmental theory as described by Jean Piaget, but mainly interpreted by U.S. early childhood educators and known as constructivism, has had the most profound influence on what is judged to be curriculum that best fits young children using the psychological perspective.

For example, developmental psychology asserts that each individual child develops logical mathematical skills that progress from concrete to abstract understandings of classificatory thinking, relationships between objects and constructs, and forms of conservation (e.g., number, volume). Curriculum goals, content, and activities are then

constructed to facilitate this logical mathematical development further and are in the form of physical manipulation, exploration, and problem solving with three-dimensional materials. Constance Kamii, a Piagetian early childhood educator, has fully developed curriculum based on developmental psychology. Three forms of knowledge are presented: physical (objects in the world), logical mathematical (relationships between objects in the world), and social knowledge (ways of functioning that are determined by the social group). Psychology has been used to create a range of developmental programs that focus more or less on particular domains, usually emphasizing play, exploration, and concrete experiences.

During the 20th century, as child development emerged from psychology as a strident voice in the construction of early childhood curriculum, a range of other events and perspectives also played a role in the construction of early childhood curriculum and in debates even within the overall modernist philosophy concerning childhood. One example is the emergence of models of early childhood education curriculum. Sources of these models vary and include the program designed by Maria Montessori in Italy in the early 1900s as a specific form of schooling to remove poor children from city streets and teach them basics for survival; programs that emerged from the U.S. war on poverty such as Head Start and Follow Through legislation in the 1960s that created specific cognitive developmental curriculum, behavioral and direct instruction oriented curriculum, and broad-based developmental curriculum models; community-oriented cognitive models such as the approach named for Reggio Emilia in northern Italy. In addition, in the United States, the National Association for the Education of Young Children has put forward a document that describes developmental curriculum that has now been circulated around the globe.

### **Critically Reconceptualizing Early Childhood Curriculum**

Consistent with challenges to universalist discourses during the late 1900s and using curriculum reconceptualization as a model, during the 1980s a group of early childhood educators from around the globe began to construct a broad-based critical perspective within the field. Using feminist

poststructuralism and postcolonial critique, the work has challenged the dominance of developmental psychology and the Euro-American belief that science can discover the contents of the mind of the Other (even when that Other is labeled child). Constructions of the concept child have been contested, as the point is made that an adult-child dichotomy both privileges Cartesian dualisms and creates advantage and authority for those identified as adults. These early childhood reconceptualists have focused generally on critical issues of oppression, equity, and social justice and specifically on rethinking the foundations of the field. Curriculum based on developmentally appropriate practice has been critiqued as monocultural, ethnocentric, and lacking the recognition of ethnic, linguistic, and cultural multiplicities. Any universalist perspective that creates one way of understanding and interpreting the world as the best is considered problematic and unjust.

This critical perspective in early childhood curriculum has introduced notions of the multiple, the contextual, and the emergent as possibilities for curriculum. Younger human beings, even those identified as young children, are accepted as partners in the educational process who can (and should) explore issues of popular culture and societal values, the complexities and multiplicities of gender and identification, diverse definitions of family and ways of living, colonialist and other socially constructed binaries (such as good and bad guys), and even the use of decolonizing feminist methodologies. Various scholars have specifically addressed each of these as related to classroom practice. An explicit example is the construction of collectivist early childhood curriculum in Aotearoa (the Māori name for New Zealand), planned learning experiences that are based on Māori culture and do not use dominant forms of psychology.

In addition to challenging dominant truth orientations regarding children and exploring the unlimited possibilities for early education curriculum and multiple knowledges overall, varied and diverse reconceptualist perspectives have pointed to the critical notion that all knowledge is political. The institution of early childhood education is discussed as a site of major and minor curricular politics—in the ways that childhood social provision is constructed—in the ways that normativity is challenged—in the ways that children and adults

work together to address social, cultural, environmental, and economic issues. Early childhood reconceptualizing suggests that even as work continues in the range of types of early education settings (whether child care, preschool or nursery, primary education, or other childhood services) that the following could always occur: (a) critique of underlying assumptions within discourse practices, (b) recognition of history and forms of dominance that privilege some and disqualify others, (c) recognition of political agendas and power structures, and (d) reconceptualizing possibilities. The examination of the effects of political agendas and public policy alterations on early childhood curriculum has been a component of this critical scholarship. The following section illustrates this inquiry with regard to applying business models to early childhood curriculum.

### **Neoliberal Business Models of Early Childhood Curriculum**

Most recently, in a range of locations around the globe, governments have put into place legislation that requires education programs to be judged based upon particular standardized test instruments. In response, multinational corporations have formed to sell and score the instruments. Private tutoring companies have been founded to provide services to educational institutions for a fee, and educational materials that teach for the test are being sold. Further, the stakes are high because if appropriate bottom-line scores are not attained (a discourse similar to balancing the financial books), there are negative consequences (e.g., labeling, loss of jobs, even entire school closures). This definition of curriculum based on particular high-stakes tests uses the language of the corporate world, terminology such as benchmarks and accountability, public-private partnerships, and neoliberal market concepts such as competition between schools, entrepreneurialism, choice, and decentralization.

Early education varies around the globe as to perspectives that support services for all as a social common good—or beliefs that would standardize curriculum for all young children—or decentralizations that depend on privately practiced programs that are funded by customers. These circumstances have affected curriculum. Although examples could

be drawn from around the globe, the remainder of this entry discusses recent actions in the United States that illustrate how this neoliberal market early education has been applied to kindergarten, primary, and in some cases preschool programs for young children in public schools and the critical inquiry of such actions. The passage of No Child Left Behind federal legislation created a lens through which schools and teachers are evaluated, and critical theorists note that it marks schools and teachers as failures based on child test scores resulting in curriculum that focuses on test content. For example, Head Start, government programs for young children from poor backgrounds that have for 40 years supported parent and community involvement in curriculum content and design, has in recent years been revised to focus on reading achievement (interpreted as test scores). Free market, school decentralization proponents who unsuccessfully advocated for government financial vouchers that could be paid to private schools, have effectively promoted schools of choice (termed charter schools) that can be administered by a range of groups that include private corporations within publically supported systems. Critical theorists contend that in the name of accountability, such practices and the public policies that support them deny the existence of either dominant or diverse forms of knowledge that can be used in educational environments related to curriculum. Further, they argue that widespread acceptance of these practices would make all forms of curriculum invisible (and potentially irrelevant to the public), whether dominant developmental perspectives or diverse forms of knowledge that would support diversity and challenge oppression and societal inequities and envisioned by critical and reconceptualist early educators.

## EARLY CHILDHOOD CURRICULUM, HISTORY OF

---

The dominant history of early childhood curriculum (as attitudes, content, and teaching methods), focusing on children from birth to age 8, is grounded in the Enlightenment, modernism, and the Euro-American construction of social science from which emerged sociology, psychology, and education. Early childhood curriculum has been located in a range of public and private education and care settings and has been termed nursery, preschool, kindergarten, and primary education. Mainstream definitions of curriculum for young children have ranged from custodial care to diverse philosophical views regarding child rearing and learning, content and activities that include play, belief in a predetermined human development process that can be facilitated by particular kinds of curriculum, child-centered teaching, and education based on behavior modification. However, over the past 30 years, a post-modern critical perception of early childhood

curriculum has emerged that contests modernist constructions of curriculum as inappropriately creating a view of younger human beings as if they are all the same simply because they are young (and labeled children). Most recently, early childhood curriculum has come under the influence of neoliberal capitalism that emphasizes high-stakes test-oriented forms of accountability, decentralization and competition, and private funding (as has much of K–12 through higher education). This entry provides a brief description of this curriculum history, first as embedded within the broad modernist, androcentric focus in (what has been labeled) the West from which emerged education, psychology, and human services; second as challenged in recent years by curricular perspectives that represent diversity and that contest universalist notions of childhood and standardized learning; and finally, as contemporarily imposed through neoliberal accountability legislation and models of thought.

The modernist discourse of early childhood curriculum is historically embedded in the construction of schooling over the past 300 to 400 years, the emergence of psychology as a field that would explain the mind of the individual, and the elitist belief that those in poverty are not generally as capable as others (especially as related to learning and education). Early childhood education is practiced in public and private locations and labeled care and/or education (e.g., preschool, nursery, kindergarten, primary education), yet beliefs influencing curriculum have generally accepted the notion that adults can determine child needs and plan curriculum that will meet those needs. Debates occur as to whether needs should be met by parents or teachers, in the home or in early childhood settings, and by public institutions or private organizations (even corporations). Disagreements have continued as to whether curriculum should be designed as academic, behavioral, or developmental; arguments continue labeling best practices as child-centered and best practices as predominantly direct instruction abound. However, debates notwithstanding, overall dominant views of early childhood curriculum are grounded in the work of European Enlightenment and Euro-American human development scholars who believe in the adult–child dichotomy, that adults can and should understand the thinking of the child, that adults can determine

universal child needs (mentally and physically), and that children progress through domains of development (e.g., physical, social, cognitive) that can be determined by experts. This knowledge is then used to plan curriculum content and activities that are believed to further the child’s growth, ability to reason, and general school academics such as reading and writing skills. Over the years, various programs have been developed by individuals such as Friedrich Froebel or Maria Montessori or through government programs such as Head Start and Follow Through legislation in the United States. More often than not, these programs have been legitimated as curriculum for poor children, a group considered to have less appropriate learning experiences in their daily lives than more socioeconomically advanced populations.

As civil rights gained attention during the 1960s generally and in the United States especially, some educators (and others) who believe in diversity grew increasingly concerned about the ways that notions of universal human (child) development and beliefs in a universal childhood experience serve to discredit cultural diversity, various forms of knowledge, and the multiple ways that human beings can experience and construct the world. Influenced by perspectives such as cultural studies, critical theory, feminisms, critical multiculturalism, and postcolonialism, some early childhood educators have challenged and continued to question modernist, child development orientations toward curriculum. Following the critical reconceptualist movement in curriculum studies, a group of reconceptualist early childhood educators from around the globe gather each year to emphasize broader, more diverse, less deterministic approaches to early childhood curriculum. This reconceptualist perspective focuses on diverse knowledges and ways of function (not simply those supported by Western interpretations of logic) and defamiliarizing what has been believed to be known about those who are younger. In addition, this early education perspective addresses societal oppressions and injustices, the social policies that construct them, and ultimately, the curriculum for those who are younger.

Although both modernist and reconceptualist perspectives continue to have major influences on early childhood curriculum, over the past 10 years, the rush toward globalization and the privileging of neoliberal market economy has shaped the content

and practice of education for young children. In many locations around the globe and in many types of early childhood settings, curriculum is being constructed based on legislation (such as No Child Left Behind in the United States) that has defined education as a score on a high-stakes achievement measure, which opponents believe results in curriculum that is grounded in the content of the test. Critics contend that much of this legislation supports corporatized programs that use achievement scores as the bottom line so that curriculum (of whatever type) has become a construct that is either standardized and prescribed or has become invisible and considered unimportant.

## ECOLOGICAL THEORY

---

*Ecological theory* is an orientation in curriculum studies that aims to be responsive to the complex intersections between culture and the natural environment and questions how those intersections work for or against environmental sustainability on a local and global level. Sustainability generally refers to practices that do not interfere with natural systems' abilities to renew themselves and to practices and orientations that will not reduce future generations' abilities to live on Earth. Although it overlaps with environmental education, ecological theory emphasizes the ways in which humans interact with their surroundings, and those interactions (not studies about the environment alone)

become central to the curriculum. Global governmental and nongovernmental agencies, along with recent developments in global climate change, have highlighted a need for a theory of curriculum that is Earth-inclusive.

Currently the term ecological theory is not widely used in curriculum studies and among curriculum theorists; more often terms such as *ecological education*, *place-based education*, and *ecojustice education* are used. However, in *The SAGE Handbook of Curriculum and Instruction*, William Pinar does use the term ecological theory and categorizes it as a political one, along with other theories committed to unearthing the hidden curriculum of schooling such as critical pedagogy and cultural studies. Pinar points out that Chet Bowers has put forth strong criticisms of the cultural assumptions in schooling that deter sustainability and that ecofeminist theory elaborates upon the relationship between gender and sustainability. Furthermore, Pinar mentions David Jardine's work in phenomenology and ecological theory. Although Pinar's account is one of the few that uses the term ecological theory, many scholars' research and work could be classified as such. Several such scholars are included in a 2005 special issue of *Educational Studies* that was dedicated to ecojustice and education. Editor Rebecca Martusewicz acknowledges and even emphasizes that not only are the authors' ideologies and assumptions different, but also they are in some cases incompatible; therefore, to offer one definition of ecological theory not only would be difficult, but also would be wrongheaded. In order to describe various aspects of ecological theory in curriculum studies, it is important to draw upon the work of a variety of scholars including Chet Bowers, Peter Corcoran, David Gruenewald, David Jardine, Rolf Jucker, Rebecca Martusewicz, Gregory Smith, David Sobel, and Kathryn Ross Wayne, to name a few. Although it is impossible to be comprehensive, individually and collectively the work of those mentioned above, as well as of others who are not named, can provide a working conceptual framework for ecological theory. To that end and to describe some of its major movements and ideas, this entry distinguishes between ecological and environmental education theory, explains several aspects of ecological curriculum theory, and provides examples of ecological theory in action.

### Ecological Theory as Different From Environmental Education

Environmental and ecological education is a collective, broad term encompassing many facets of Earth-inclusive education. Traditional environmental education is primarily housed in math and science subject areas or offered as supplemental to the regular curriculum. Gruenewald has argued that environmental education in this institutionalized form negatively affects its original social and ecological goals, and that because environmental education has largely been subsumed by general education, it loses its potential for true reform.

The more recent movement toward ecological curriculum theory emphasizes the embeddedness of humans in natural biological systems. In other words, ecological theory does not, as environmental education often does, teach about the environment as a subject, but rather reorganizes curricula around the connections between humans and their environment. Gregory Smith and Dilafruz Williams, in their edited volume *Ecological Education in Action: On Weaving Education, Culture, and the Environment*, point out that while environmental education is generally focused on scientific analysis of environmental problems and social policy, ecological education attends to the necessary cultural transformations that must take place in order to live sustainably. Furthermore, ecological education emphasizes attention to humans' relationships with particular places and draws wisdom from cultures that have, in the past and present, lived sustainably through specific practices suited to the characteristics of their local regions.

Ecological education seeks fundamental transformation in the ways humans reside in their natural, social, and built communities. To that end, several principles guide ecological education. First, learning should be grounded in a sense of place. This sense of place should be cultivated by exploring local human and natural communities, especially in conjunction with local elders. Second, students should develop and practice an ethic of care for local and for distant places and people. Third, students should be afforded an opportunity to experience community settings that counter individualism and promote restoration of the commons (shared resources). Fourth, students should acquire practical skills and knowledge needed for sustainable lifestyles. Fifth, ecological education

models should offer critiques of cultural assumptions that have led to the ecological crisis. In other words, ecological education provides a vision for not only a healthier Earth, but also a healthier global community.

Ecological education has also been recently connected with global education. Nel Noddings, an educational philosopher long concerned with care theory, outlines the ways in which ecological thinking helps us understand the interdependent nature of all humans on the planet. Ecological thinking includes habits of mind such as information gathering, reflection, and critical thinking that result in care for other global citizens. Attention to care in ecological education has been echoed by others and remains an important aspect of ecological curriculum studies.

### Phenomenology and Integrated Curriculum

Phenomenological curriculum theory attends to the lived experiences of those in particular situations; from an ecological perspective, phenomenology refers to the associated contexts and connections. Jardine espouses this idea with a simple example. In one of his education courses, he hands out a piece of paper and instructs his students to list ways in which the paper could be used in or as curriculum. One student suggests that all curricula could be organized around this single piece of paper—how it was made; the effect on trees, soil, and water; the loggers and their lives; and the fuel and chemicals required to process and refine the paper. Thinking about curriculum in this way, Jardine contends, leads to a truly lived curriculum, one that speaks to how humans live their daily lives. In studying one thing, he suggests, one is studying all things, a curriculum that opens doors to the complexity and vitality to which Jardine refers. Rather than offer children mastery of requisite skills and accumulated facts, ecological education in this form aims to offer the skills, knowledge, and understandings to literally live on Earth, to sustain their own lives and the lives of their communities.

Jardine's contributions to ecological theory in large part deal with integrated or connected curriculum. At the heart of this integrated curriculum is attention to a variety of voices of which the human voice is just one among many. Rather than separate learning into predisposed disciplines

such as math and science, integrated curriculum takes advantage of emergent order, and organization must originate from things themselves. Teaching, then, is characterized in part by introducing children to the authority of the ecosystems that sustain them.

### Ecojustice Pedagogy

Ecojustice pedagogy seeks to help communities revitalize sustainable practices through commons-based educational reforms. The *commons* refers to natural systems and cultural patterns that are shared, without monetary cost, by all members of a community. For example, air, water, and forests are aspects of natural systems to which all community members should have equal access. Cultural commons include intergenerational knowledge of food preparation practices, arts, and medicine, among others. Ecojustice educators contend that enclosure of the commons, or the privatization and corporatization of the commons, limits access to and democratic decisions about shared resources.

Ecojustice pedagogy emphasizes the interrelationship among human cultures and the more-than-human world. Specifically, language and thought patterns, or root metaphors, may be evaluated for their juxtaposition to sustainability. Bowers emphasizes the flaws of metaphors such as individualism and anthropocentrism, suggesting that they be replaced by a different root metaphor: ecology. As the root metaphor (pattern of thinking) for ecojustice pedagogy, ecology emphasizes interdependent relationships instead of individualistic pursuits that place higher importance on human progress (over the health of the entire system). Bowers elaborates on how ecology as the root metaphor informs educational processes—that they must respond to the fact that living systems involve conservation, change, and the adaptation of diverse cultural systems. Bowers suggests three areas of focus: (1) environmental racism and class discrimination, (2) recovery of the noncommodified aspects of community, and (3) responsibility to future generations.

### Place-Based Education

Place-based education describes an approach to schooling and to curriculum studies that considers

the local environment of primary importance; learning experiences arise from local contexts. Attachment to place and beliefs about the natural world affect how humans live as global citizens. Understanding what place means to themselves better enables students to understand what place means to others in distant parts of the globe. Four aspects of the human connection to place include the political-psychological, the environmental, the relation between local and global citizenship, and love of place and human flourishing. By reorganizing curriculum to include studies of place, the local environment, and human flourishing, ecological educators strive to help students become better global citizens.

A broad range of initiatives fit under the title place-based education. Not only is place-based education a way to simply incorporate Earth-based themes, but also it serves as a model for whole school reform efforts. However, because the place-based models are place specific, there is no prescriptive framework for what must happen. Instead, David Sobel has offered four philosophical directions that characterize this type of reform.

First is the importance of understanding local limits and learning how to live within our means at a local and global level. For education, this means embracing sustainability as an overarching principle. The second principle moves educators to thinking about schooling as an ecology with interconnected parts that advocates for integrated curriculum that is project based, characterized by teacher collaboration, and involving extensive use of community resources and volunteers. Systems thinking in schools would blur the lines between home and school—between learning and life. The third principle encourages a shift in curriculum that would match the child's developmental needs; it should focus first on the local and immediate before expanding to historical and global perspectives. The schoolyard and nearby habitats provide such a curriculum. The fourth principle urges educators to tailor curriculum around the local environment and culture. Therefore, each school has its own curriculum because it has its own surrounding environment and culture. This curriculum can happen in urban, suburban, or rural environments. These four philosophical directions underscore the importance of teachers in the

school reform process, and schools wishing to use the place-based model are encouraged to hire an environmental education consultant—a teacher whose job it is to support and inform ecological investigations. These four core principles suggest a deeper understanding and exploration of what it means to live in a particular place. Furthermore, these deep understandings are said to restore humanity's adaptive capabilities that will lead to ecological, not just human, flourishing.

In addition to echoing many of the above themes of place-based education, David Gruenewald and Gregory Smith reiterate that place-conscious education emphasizes local diversity and social consciousness. More specifically, Gruenewald and Smith challenge the notion of culturally responsive pedagogy that is not also place responsive. This critical pedagogy of place includes attention to the experiences of people in their total environments—social, cultural, built, and natural—and the associated historical and cultural memory of particular places. In other words, because culture and place are inextricably linked, so should be the educational systems that serve local communities. These educational systems should engage in decolonization, or understanding local forces of oppression, and reinhabitation, the ways in which communities can shift to more sustainable local ways. Children who experience such an education, it is suggested, will then be better able to determine which aspects of contemporary society are worth preserving and which are not.

### Common Roots: Ecological Curriculum Reform

To illustrate several of the above ecological principles, it is useful to turn to an example provided by Joseph Kiefer and Martin Kemple, who discuss their efforts to reform public elementary schools in Vermont based on a pedagogy of place. Common roots is a comprehensive school reform model that sought to connect public elementary schools with the local community knowledge and natural heritage. The impetus for this reform effort was the astounding recognition of statewide hunger in Vermont, a traditionally agricultural state. Therefore, food and gardening became a central educational and ecological principle guiding the curricular reform efforts.

As the project progressed, Kiefer and Kemple recognized the need to further include teachers in their reform efforts. They designed a three-credit university course that was focused on the cultural causes of curricular segmentation and its implications for schooling, for communities, and for the world. Through this course, teachers developed integrated curriculum that formed a schoolwide journey. This journey reflects and explores the community in which the school is situated. Five basic questions framed the curriculum development: Where are we? Who are we? What are we doing? Where can we go? How do we get there? Many themes emerged from their discussions, including how the local community sustained itself for the previous generations and what future generations will need to know and be able to do. Some themes include historic theme gardens through which a variety of foods were grown each year that reflected a particular time in the community's history, school yard habitats through which the local diversity of life was explored and nourished, and cultural literacy through which the customs, traditions, and lifeways of the local cultural and ethnic groups were learned and passed on. Common roots is an example of a comprehensive, community-centered transformation that integrated practical experiential projects pertaining to local history, agriculture, arts, and environmental issues.

## ECOPEDAGOGY

---

The term *ecopedagogy* is a blending together of the two terms *ecology* and *pedagogy*. Unlike environmental studies, ecopedagogy is not concerned with a particular topic area within science education. Rather, ecopedagogy was coined as a way to think about the nature of curriculum itself and as a way to organize, understand, and teach in all curricular areas. As such, it provides teachers and researchers with an alternative model of curricular theory and practice that steps away from antiquated industrial images of knowledge and learning and that is more in line with a wide range of contemporary research in the natural sciences, the human sciences, and work that explores the place of information and communications technologies in education.

Ecopedagogy was formulated as both a critique of and an alternative to the industrial assembly-line model of curriculum. In this industrial model, curriculum topics are broken down into their component parts, placed in developmental sequences according to rules of efficient, sequential assembly, and doled out one isolated piece at a time to students. Ecopedagogy thinks about curriculum differently than this. It begins with the assumption that curriculum topics are not objects that can be disassembled and whose disassembled parts can be treated as if they are authentically learnable independently of the relations between those parts. Any seemingly isolated curricular mandate or objective is to be rethought in terms of the fields of relations to which it belongs. Ecopedagogy thus draws upon ideas, assumptions, and images from

ecology—interdependence, relationships, landscapes, fields, habitats, generativity, renewal, cycles—and uses these to place or locate curriculum objectives or ideas back into the conceptual and disciplinary locales that make them what they are. Curriculum topics are to be thought of as full of relationships and interdependencies; they are to be thought of as existing in rich and diverse fields of thought. All of the curriculum areas entrusted to students and teachers in schools are thus to be treated as living disciplines rather than piecemeal objects. For example, the first question ecopedagogy asks when addressing a curriculum topic such as quadratic equations or the use of commas in English sentences is not how do I teach this piece of knowledge to students, but rather where does this piece of knowledge belong. What is the field within which this is a meaningful and substantial piece of knowledge? What other ideas, concepts, knowledge, experiences belong in this field with this topic? In other words, the basic questions of ecology are about the topic under question, its topography, its surroundings, and its place. Only then is an ecopedagogical approach to curriculum ready to ask the next question: How do I open up this field of relations for my students and invite them into the work that is proper to this field?

There are several related consequences to the shift to ecopedagogical thinking. First, it involves not only a move from assembly-line consciousness to field consciousness, but also a move from the arms-length objectivity, distance, and disinterest that an assembled object demands to a sense of immediacy, implication, and investment in what one knows. Ecopedagogically conceived, curriculum topics are living inheritances whose life and well-being are placed in the hands of teachers and students. Ecopedagogy therefore requires teachers and students to think about how they are already living in the midst of these topics and what their real life is in the world being passed on to the young. Knowledge, thus conceived, is both intergenerational and ancestral. The Pythagorean theorem, for example, is not just a formula that one can memorize for an upcoming examination, but is a clue to a long, complex history, and an opening into a large field that included right angled triangles, surveying, architecture, art and visual composition, ancient Greek cults, the harmony of the spheres, daVinci's Vitruvian Man, and so on.

This multiplicity is another characteristic of ecopedagogical understanding of curriculum—these curriculum topics are, of necessity, both bounded and open ended. Unlike the assembly-line image where a fragment of knowledge is learned, applied to an examination, and then forgotten, each piece of work adds itself to the enrichment of one's understanding of a field. Lifelong learning, then, is not just an educational cliché, but is in the nature of knowledge as, so to speak, living fieldwork. Living disciplines are not fixable once and for all, but are open to question, extension, and exploration. Therefore, ecopedagogy necessarily links curriculum and teaching to the living practice(s) of knowledge in the world. Who are the experts in this field? Where and how is this knowledge practiced in the world? How can the knowledge explored in the classroom be made public? These are the sorts of questions that ecopedagogy requires. Unlike environmental education, which speaks of the (albeit valuable) practice of getting students outdoors into the environment, ecopedagogy understands all curriculum areas as having an interdependently worldly character.

Ecopedagogy relates to ideas such as multiple intelligences and differentiated curriculum. Each of the curriculum topics entrusted to schools is diverse and multiple. Quadratic equations, for example, are numeric and abstract, geometric and spatial, discursively describable, picturable in images, expressible in artistic forms, visible in the arcs of a tossed baseball or the curves of Frank Gehry's architecture. Ecopedagogically conceived, curriculum topics need differentiation and multiplicity, not just because students have multiple ways of knowing, but because the topic under consideration is itself multiple and diverse.

Ecopedagogy also links to new work in the neurosciences about how learning occurs, to the ways in which new computer technologies rely on an image of knowledge organized as a web, to recent work regarding indigenous peoples' ways of knowing where every seemingly isolated thing is in fact full of all its relations. Finally, with its emphasis on living disciplines, ecopedagogy lends itself to new forms of curriculum study that focus on the life-world of teachers, students, and schools.

## EDUCATIONAL CONNOISSEURSHIP

---

*Educational connoisseurship* is a term used in the field of curriculum evaluation and research to denote a heightened sense of awareness of the subtleties of various educational and curricular phenomena. The term was coined by Elliot Eisner in the early 1980s. Educational connoisseurship is the first condition necessary to engage in the act of educational criticism. Educational criticism is an approach to educational evaluation in which the subtle qualities perceived are rendered in a form that is analogous to the writing of art critics.

Educational connoisseurship implies an ability to see clearly the complexities within educational or curricular commonplaces. In defining connoisseurship, in general, Eisner drew upon the work of John Dewey as he distinguished between the act of recognizing particulars as members of a category or examples of a concept, and the act of *perceiving* qualities within objects, settings, or events that set them apart from all others. Perceiving requires a kind of sensory exploration that goes beyond mere recognition of that which has been previously encountered. One may therefore be a connoisseur in almost any aspect of life, whether baseball, bicycles, beer, artistic sculpture, or curriculum materials. An evaluator or researcher who is an educational connoisseur observing, for example, a classroom will be able to appreciate the unique

character of the activities in which students and teachers are engaged.

How is connoisseurship developed? It begins with a desire to experience and appreciate nuances within a set of phenomena. However, this experience must be developed over time, the result of a sustained, focused effort at perception. Moreover, connoisseurship demands a concentration that provides lasting memories of particular qualities experienced. Memory provides a crucial background against which new perceptions are placed, allowing for finer discriminations of qualities. In classroom settings, therefore, an educational connoisseur must become a student of human behavior or artifacts. This role will usually require, among other things, experience within a variety of educational settings over time that allows for ever more finely tuned comparisons and contrasts to be made.

Eisner also emphasized the importance of a classroom structure within which apprehended particulars are placed (although other theorists have not unanimously agreed with this). Eisner often employed the metaphor of a game of chess to make this point: In order to understand the meaning of the various moves therein, players and onlookers must first be aware of the structure or rules of the game in which particular strategies are played out. Likewise, for Eisner, a deep acquaintance of the educational connoisseur with various theories in the social sciences (and education in particular) is important, along with a broad understanding of educational history. Once again, this theoretical and historical knowledge should serve as a backdrop for richer descriptions of educational phenomena and a prerequisite for wiser educational decisions.

Some critics of the notion of educational connoisseurship have objected to what they see as a sense of elitism connoted by the term. Some have decried it as a privileging of outside experts with specialized backgrounds who offer deeper truths about the meanings inhabiting an educational setting than those available to practitioners and other inhabitants of the setting. It is doubly troublesome to critics when the notion of educational criticism is paired with that of educational connoisseurship. When the so-called insights of an outsider are inscribed into a privileged text, antidemocratic issues of power may come into play.

Proponents of educational connoisseurship and criticism have responded to these objections by insisting that their epistemological intents have been misconstrued. Far from an assertion of objective truths, their critiques, they argue, are meant as careful but fallible accounts to be placed against a variety of similar observations by others (including educational practitioners and administrators) who likewise move beyond an exclusive reliance on quantitative instruments, observation schedules, standardized skill checklists, and the like. Because Eisner saw all human endeavors—including acts of perception and judgment—as inevitably value-based, he cautioned that totally objective accounts are impossible. It is, therefore, crucial, for ethical reasons, that multiple accounts from various vantage points be made available through the processes of curriculum and educational evaluation.

## ***EDUCATIONAL IMAGINATION, THE***

---

*The Educational Imagination: On the Design and Evaluation of School Programs* (1979, 1985, 1994) is perhaps the most influential book authored by Elliot Eisner in the field of curriculum studies. The book has been widely viewed as greatly contributing to the development and advancement of a school of thought that highlights the importance of aesthetic theory in thinking about curriculum design and program evaluation. Indeed, in 2000, the Museum of Education

at the University of South Carolina designated it as one of the significant books of the 20th century.

*The Educational Imagination* represents Eisner's most successful attempt at bringing his background in the arts (especially the visual arts) to bear on the field of curriculum studies. Although some of the groundbreaking ideas within it were presaged in his earlier writings and public addresses, the book applied an aesthetic approach to educational planning, teaching, and curriculum evaluation in a single textual space. The book thereby presented a coherent alternative to the dominant systematic, science-based tradition of curriculum development, instructional delivery, and assessment of learning.

At the heart of this alternative approach is an emphasis on the importance of the aesthetic elements of imagination, nuance, and context in matters of curriculum. This emphasis was evident throughout, as Eisner made the case for (a) the mapping of a variegated field consisting of six curriculum ideologies, (b) a planning process that welcomed the possibilities of emergent and unpredictable outcomes, (c) the inevitable presence of the null (or untaught) curriculum, (d) a view of teaching as an art rather than as a science, and (e) the perception of subtleties in curriculum commonplaces through educational connoisseurship and within the genre of curriculum evaluation called educational criticism, the use of artistic media in disclosing what has been perceived.

Eisner suggested that curriculum planning and evaluation occur within any of several of what he (first and second editions) called orientations, and later (third edition) ideologies. Each ideology is inevitably value saturated and always, in a democratic society, in competition with the others. These belief systems are, however, rarely fully articulated and publicized; nor, therefore, are the educational aims and goals that flow from them. They are, nevertheless, important to understanding what Eisner identified as the three kinds of curricula taught in schools: the explicit, the implicit, and the null curriculum. The latter notion includes the wide range of items that are neglected or undertaught, within schools. Eisner's conception of the null curriculum may have (at least partly) emerged out of his lifelong advocacy

for the arts in public schools, a subject often considered frivolous rather than basic to the curriculum.

A third important contribution to the field of curriculum studies in *The Educational Imagination* concerns the use of advanced organizers in curriculum planning. Through this book, Eisner popularized and refined his earlier arguments against the dominant view of behavioral objectives as the singularly sanctioned formulation of curricular aims in the planning process. Eisner offered an alternative set of possibilities for identifying educational aspirations within curriculum planning. This was the notion of the expressive outcome. Expressive outcomes, argued Eisner, are not statements of final outcomes specified prior to an educational activity. Instead, they arise within and through educational activities that allow for an array of unpredictable but productive outcomes.

Finally, because Eisner saw curriculum planning and teaching as artful activities, he imagined the possibilities of evaluators employing the strategies of art criticism for understanding and disclosing their most salient features of curriculum commonplaces. To that end, he desired an educational evaluator to be a kind of connoisseur of the subtle dimensions of curriculum and teaching in specific contexts, with the talents needed for artistically disclosing them to an audience in a powerful, aesthetic manner. Eisner included examples of works of educational criticism (most by his students) in each edition of the book.

## EDUCATIONAL LEADERSHIP

---

*Educational Leadership* is the official journal of the ASCD (Association for Supervision and Curriculum Development), formed out of a merger in March 1943 of the Department of Supervision and Directors of Instruction of the National Education Association (NEA) and the Society for Curriculum Study to become the Department of Supervision and Curriculum Development of NEA, which changed its name to ASCD in 1946 and became an independent organization.

In October 1943 this new department established *Educational Leadership* as its journal. The publication committee consisted of the representatives from the public schools, education professors from a variety of universities, and the president of the Department of Supervision and Curriculum Development. The first editor was Ruth Cunningham, executive secretary of the Department of Supervision and Curriculum Development.

The content of the journal was targeted to the membership of this department: supervisors, school principals, professors of education, curriculum specialists, teachers, and superintendents of schools. The title for this journal, *Educational Leadership*, was chosen to appeal to those individuals who were visionary and who could energize their colleagues to move forward to tackle the problems inevitable in a changing educational world. *Educational Leadership* was published monthly from October through May. From its inception, *Educational Leadership* was a themed journal. The first issue, October 1943, was titled “Teaching in Wartime” and included topics related to the patriotic nature of teaching, the teacher shortage, helping emergency teachers, the joy of teaching, and the effects of the changing world on teaching.

ASCD continued to publish *Educational Leadership* as one of the benefits of membership in ASCD. As the journal developed under ASCD, the editor’s role transformed from being the responsibility of the executive editor of ASCD to a full-time position. The first full-time editor of *Educational Leadership* was Robert Leeper, who began his duties in 1950. Many of the features of the journal created under NEA were continued by ASCD: for example, themes continued to direct

the content of the journal; columns focused on various curriculum concerns—“The New in Review”—and included new ideas in curriculum development, reviews of books, films, recordings, and programs and was edited by Alice Miel; I. Keith Tyler coordinated “Tools for Learning”; Henry Harap organized “Front Line in Education”; and Steve Corey developed the “Importance of People.” In 1949, Fred T. Wilhelm, executive secretary of ASCD, included the column “Curriculum Research,” which continued into the mid 1970s. Historically, at least one third of the issues of *Educational Leadership* from 1943 to 1964 were devoted to issues related to curriculum development.

*Educational Leadership* began and continues as a themed journal, soliciting articles focusing on pertinent issues of the time and serves as a source of current information on new ideas, controversial issues, social concerns, and research-based programs for those professionals who continue to work in the educational world.

## EDUCATIONAL RESEARCHER

---

*Educational Researcher* is one of a number of journals published by the American Educational Research Association (AERA). It is unique among AERA journals, however, for at least three reasons. First, it is the only AERA-published journal that is sent to all members of the association. Second, because all members of AERA receive the journal, it is used by the association to communicate various sorts of association business to members of the association. Every May, for example,

the “Call for Proposals” for papers and sessions to be presented at the following year’s association meeting is printed in the *Educational Researcher*. Finally, the *Educational Researcher* does not normally publish studies, per se, or even traditional literature reviews. Rather, the preferred genre in this publication is something akin to the essay.

Each issue of the *Educational Researcher* is divided into three sections. The first section contains what are referred to as feature articles. These articles normally run from 5,000 to 7,000 words. A second section labeled “Research News and Comments” contains somewhat briefer and more narrowly focused discussions of policy issues and controversies that either directly or indirectly impact the practice of educational research. The final section contains conventional book reviews and essays that review related works of different authors or of a single author’s line of research. The *Educational Researcher* has served as a forum in which some of the field’s most disputed questions are debated. During the final quarter of the 20th century, for instance, when advocates of quantitative and qualitative research methods were waging the so-called paradigm wars, the pages of the *Educational Researcher* frequently were used to debate a whole range of methodology-related questions.

In a landmark *Educational Researcher* article, for instance, Sandra Mathison demonstrated why qualitative researchers’ notion of triangulation should not be thought of as a synonym for quantitative researchers’ concept of reliability. Similarly, Alan Peshkin, in another issue of the *Educational Researcher*, presented a compelling case for thinking of qualitative researchers’ subjectivity as a potential asset rather than as an inevitable liability in the inquiry process. Years later, as the 20th century was nearing an end, a newly named features editor, Robert Donmoyer, published an *Educational Researcher* article that explored issues related to editing an association journal in a paradigmatically diverse field such as education.

During the first decade of the 21st century, the *Educational Researcher* has continued to function as a forum in which members of the educational research community can debate important research-related issues. A 21st-century controversy that has received considerable attention on the pages of the *Educational Researcher*, for instance, is the one ignited by the publication of

the National Research Council’s (NRC) report, *Scientific Research in Education*, a report that defined scientific research quite narrowly. Educational researchers who were displeased with the report’s definition often articulated their displeasure in scholarly articles published in the *Educational Researcher*. The journal also published responses to critiques of the NRC report—as well as complete articles—by those responsible for the report.

Undoubtedly, the *Educational Researcher* will continue to serve as a forum in which research-related issues can be debated. In this era of blogs and online message boards, this sort of forum may seem less important than it used to be. Still, there should always be a place for debates built around well-crafted papers in which arguments are carefully rendered and precisely made. At its best, this is what the *Educational Researcher* is about.

---

## EDUCATIONAL TESTING SERVICE

---

The Educational Testing Service (ETS) was established in October 1947 to consolidate five testing offices including the College Entrance Examination Board (CEEB), Cooperative Test Service, and Graduate Record Office. The ETS received its charter as a nonprofit corporation in December 1947 from its New York office (Princeton University housed the main office). When the ETS was established, there was no national testing agency in the United States, although about 60 million tests were administered

to 20 million people each year. Quickly expanding into a national institution, the ETS was created to produce and administer tests, enhance their technical features, and conduct psychometric research. However, it has never been clear whether the ETS is a testing agency, curriculum clearing house, or personnel records office. The conflation of these functions underlies fundamental questions of testing, curriculum, and class stratification: Is the ETS public spirited or does it preserve private privilege? Are the tests it produces and administers fair? Has its corporate power to standardize curriculum exceeded public mechanisms to regulate this process? The corporation's non-profit status is also perennially thrown into question, given that its first large-scale contract (draft-deferment testing for the Selective Service System in 1951) generated a \$900,000 profit, and its current annual revenue is \$900 million from 24 million test takers.

The ETS's most recognizable tests were produced or acquired in its first two decades and continue to generate a base of revenue and controversy. The *Graduate Record Examination* (1949), *National Teacher Exam* (now the *Praxis Series*; 1949), and the *Test of English as a Foreign Language* (*TOEFL*; 1961), acquired from the CEEB in the mid 1960s, are immensely popular. For example, the *TOEFL* is administered each year in 110 countries for 6,000 institutions to 6.2 million test takers (compare to 600,000 *Praxis I* and *II* exam takers each year). But perhaps the *Scholastic Aptitude Test* (*SAT*), initially developed in 1926 and its derivatives, such as the *SAT Achievement Tests* (*SAT II Subject Tests*; 1934), *Junior SAT* (1937), and the *Preliminary SAT* (1959), are the most renowned and controversial. Although initially called an aptitude test, the *SAT*, it has been argued, has the characteristics and faults of intelligence tests. The aptitude or ability measured is simply the ability to do well in college. Measuring developed ability or educational preparedness to predict college performance, the *SAT* provides objectivity for making tough, meritocratic decisions on admissions and awards. It is defended on a basis that its measures are free of bias. *SAT* test takers increased from 80,000 in 1950 to about 800,000 in 1960, the year the University of California system began requiring the test for applicants. Annual administrations

surpassed one million in 1963 and are currently at about 2.2 million. Increases in the number of students taking the *SAT*, or its rival, the *American College Test*, track college enrollments. Findings of discrimination in testing were common through the 1960s and 1970s, and the *SAT* raised a far-reaching question: Can scores be significantly raised by curriculum?

The commercial test prep or tutoring industry paralleled the expansion of the ETS, and standardization was coincident with testing. In 1976, the Federal Trade Commission (FTC) began investigating companies, such as Kaplan, that advertised increases, as much as 150 points, on the *SAT* (total = 1600) challenging the ETS's position that tutoring made little difference. The FTC's 1978 report affirmed tutoring claims, unifying activists for truth-in-testing legislation and access to curriculum. California enacted legislation in September 1978 and New York in January 1980 to require disclosure of test items used in determining individual scores. Also in 1980, Ralph Nader released *The Reign of the ETS*, a scathing 554-page report—a last straw forcing the corporation to reconcile its public profile with its power and monopoly. The tutoring and standardized curriculum market boomed; Sylvan Learning Systems was founded in 1979, and The Princeton Review in 1981. In 1993, Sylvan won an exclusive provider contract to administer the ETS's electronic tests in centers across the United States while landing contracts with city school districts to standardize curriculum for the *SAT II* and other tests throughout the 1990s. ETS is now a multinational corporation including the ETS Global Division and ETS Global BV subsidiary.

## EDUCATIONAL WASTELANDS

---

In 1952, Arthur Bestor, a professor of history at the University of Illinois, submitted a series of resolutions to the American Historical Association contending that educational theorists and school administrators devised programs of teacher training that degraded academic subjects. A year later, Bestor published these complaints in his book *Educational Wastelands*. Although Bestor's criticisms fit the views of conservative citizen's groups who disliked the progressive influences in schools, Bestor distanced himself from such reactionaries. As a young student, he had attended Lincoln School of Teachers College, Columbia University, one of the most progressive secondary schools in the country. Praising many of his former teachers, Bestor approved of the genuinely thoughtful progressive education he had received; however, he was disappointed when the faculty had introduced a course called social studies wherein students discussed social problems without the careful analysis typically found in historical studies. Bestor applied the name, regressive education, to this tendency to turn progressive education into anti-intellectual activities.

In *Educational Wastelands*, Bestor charged that two educational movements epitomized regressive education. One was life adjustment training. The other was the effort of the National Education Association's Educational Policies Commission (EPC) to spread comprehensive high schools.

According to Bestor, the life adjustment movement began in 1945 when Charles Prosser drafted a report of a conference of educators that claimed 60% of U.S. youth could not benefit from traditional academic or vocational training. To help this majority of students whom school programs had abandoned, the federal government appointed a commission on life adjustment education, and states such as Illinois offered curriculum programs that offered training in life situations such as selecting the family dentist, maintaining wholesome relationships, and improving one's personal appearance. Bestor noted that the life adjustment movement claimed it would offer solutions to these life situations, but he believed the claim was ironic. Disciplines such as history, sociology, and political science had arisen to offer sustained and

objective critical inquiry to help people understand the sources of social difficulties, and life adjustment education disparaged such academic study.

Interestingly, historians disagree about the importance that the life adjustment movement had on curriculum. On the one hand, Diane Ravitch argues that the life adjustment movement exerted significant influence on teacher training, and the direction of that influence was anti-intellectual. On the other hand, Daniel and Laurel Tanner contend that there were only two commissions on life adjustment education, and these disappeared by 1954, shortly after Bestor published his book. According to the Tanners, the contribution of life adjustment education was to offer critics a label they could deride.

The other and more important object of Bestor's criticism was the EPC. Quoting a supplement of the 1944 report, *Education for All American Youth*, Bestor claimed the members of the EPC wanted schools to satisfy 10 common needs of youth. These included such needs as developing salable skills, maintaining good health, and understanding the rights and duties of citizens in a democratic country. These may be important needs; however, Bestor thought institutions other than schools should deal with them. For example, schools cannot ensure that children maintain good health, but schools can teach students to express themselves accurately in their mother tongues. Further, developing the ability to speak well could enhance people's opportunities for employment, at least indirectly.

When Bestor looked for the authors of the proposals, he found they were members of three groups: professors in colleges of education, public school administrators, and bureaucrats in state offices of education. Bestor said these groups formed an interlocking directorate that dominated public education and that recommended policies for textbooks and curriculum development.

The case of the EPC may indicate that Bestor overstated his complaints. For example, James Conant, president of Harvard University, was one of two university presidents on the EPC in 1944. Furthermore, in 1952, Conant was chairperson of the EPC when the EPC released a report titled *Education for All American Youth: A Further Look*. Noting that the end of World War II did not bring peace to the world, the report urge high

schools to meet the needs of youth; however, the report added that the nation needed experts in science, mathematics, and languages who could aid in the country's defense. Thus, the EPC's revised report included statements about the benefits of academic disciplines.

The important question was whether all students should study academic courses. Bestor declared that all students required sound knowledge of science, history, economics, philosophy, and other fundamental disciplines. Although Conant may have agreed with Bestor's sentiment, the EPC's recommendations offered gradations of academic disciplines to students with differing abilities or interests.

## EDUCATION AND THE CULT OF EFFICIENCY

---

*Education and the Cult of Efficiency*, by Raymond E. Callahan, is widely considered to be the most important and thorough examination of the history of the social efficiency movement in the fields of education and curriculum. The book, published in 1962 and dedicated to progressive educator George S. Counts, offers a classic critique of the scientific management approach to schooling. Although this approach achieved prominence during the first third of the 20th century, many suggest that it underpins the popular imaginary about and administration of schools today.

Callahan meticulously documents the early incursion of the principles of a business model into the organization of schools and the curriculum development process. Explained in the 10 chapters of the book are the principles and mechanisms of scientific management, the negative atmosphere regarding schooling in the second decade of the 20th century, the application of the approach by educators, the work of the educational efficiency expert, the platoon school movement, the new profession of the school executive, and the mainly deleterious results of the movement.

Although the book has held great interest for the field of educational administration, it has also held great consequences for the field of curriculum studies. This result is largely due to the fact that the principles of scientific management were transported into the arena of curriculum design.

The notion of scientific management was the brainchild of business consultant and industrialist Frederick Taylor and introduced to education most prominently by curriculum theorist Franklin Bobbitt. The rationale of school-based scientific management relied heavily on the public school as a business or factory. It was a response to a discontent among the public that schools were spending tax dollars wastefully. An approach based on sound principles of science and business was considered to be an effective remedy for this state of affairs.

For Callahan, however, the idea of school-based scientific management was an approach that, while considered by many to be a panacea for what ailed education, in reality possessed several significant drawbacks. Among them, he argued, were the following:

- Control of the educational process would be removed from the hands of lay people who are presumably the source of a true democracy and placed into the hands of efficacy experts and businesspeople, who would operate in their own specialized interest rather than in the broader interests of the public.
- The scheme radically misunderstands the nature of the educational process as one that is quite simple and merely procedural. Callahan suggests that the plan is naïve in its failure to grasp the complexities of education as a field that is not simply mechanical in nature, but that is fraught

with all of the complexities inherent in human activity.

- The plan mistakenly views school people in terms of a factory metaphor with students as raw materials on an assembly line to be assembled by the workers (teachers with predetermined standardized procedures, cooperatively overseen by supervisors, or school administrators) to ensure efficiency in teaching the greatest amount of material to the greatest number of students in the least amount of time.
- The scheme gave greater power to administrators over teachers who, for Callahan, are closer to students and therefore are more likely to grasp the idiosyncratic needs, proclivities, and talents of each individual child. Moreover, teachers are demeaned in the process, considered to be (as by Franklin Bobbitt) mechanics ordained to follow rigidly received instructions rather than philosophers who are capable of making complex, value-based, professional decisions on behalf of students.
- The scientific management approach is designed to offer scientific certainty in a field that may not be essentially a science and that is instead necessarily one filled with ambiguity and uncertainty. In its desire for absolute comparisons between schools and school people to allow for rewarding the most efficient, scientific management offers a false precision in its focus on learning outcomes that are easily measured over the more complex that cannot be accurately measured.

## EDUCATION OF BLACKS IN THE SOUTH, THE

James D. Anderson's *The Education of Blacks in the South, 1860–1935* explores the antecedents and unfolding of Black education in the South. He asserts that the conflict of free labor versus slave labor alongside the socioeconomic political environment of the post-Civil War South shaped decades of Black education and its curriculum debates. This work provides an in-depth examination of the origins of the curriculum in segregated schools.

Preceding legal freedom, Anderson notes that Blacks were drawn to education and founded underground schools for themselves. As the slaveocracy crumbled, efforts to educate Blacks gained support from abolitionists, missionary societies, and benevolent Whites.

By the mid-1860s, the newly established Freedmen's Bureau found 500 Black schools already existing as the formative period for exslaves' education was underway. The curriculum quickly became contentious as Southern Black leaders envisioned a classical and liberal curriculum for literacy, uplift, and socialization. Powerful Northern philanthropists and social engineers wanted stability in the new South.

Anderson describes the initial architecture of the new Black education and curriculum. Hampton founder and leader, Samuel Armstrong, brought his missionary background, military experience with Black soldiers, and understanding of the political economy of the new South to the task. Proclaiming people of African descent as inferior, he felt them teachable and suited to the agricultural and vocational demands of the new economy. Most importantly, Blacks, he felt, needed character education and moral training. He established Hampton as a normal school committed to industrial or trade education and teacher training.

Anderson's exploration of the Hampton curriculum revealed daily course hours in vocational training alongside Bible study, lessons in practical morals, citizenship training, and character building. Respect for property and contracts was a part of the curriculum. Students were taught table manners, cleanliness, and the habits of work. Ideologically, the plight of Blacks was explained in

the Hampton social studies course as natural and that their advancement was best accomplished by social responsibility. These concepts were packaged as the uplift and development of the race. Accommodationism meant Blacks must fit into the social order, not try to disrupt it. The Hampton idea evolved as a merger of pedagogy and accommodationist social philosophy. The curriculum was, in effect, ideology. Hampton became a case study in the political construction of school curriculum.

The last few decades of the 19th century saw the collapse of Reconstruction, a surge in Southern violence against Blacks, the expansion of Northern industrialization, and the consolidation of corporate hegemony. As the century turned, philanthropic foundations became more involved in Black education and the selection of school knowledge.

The curriculum became a major battleground as Northern corporatists made extended efforts to connect with Southern moderates. Anderson chronicles the many conferences; for example, he chronicles Capon Springs, which was attended by corporatists and during which policy was established even though Black educators were excluded. The industrial philanthropists favored manual and vocational training combined with accommodationist ideology instead of a liberal, more classical curriculum. The curriculum of accommodationism, Anderson argues, was sought to maintain Southern racial hegemony while advancing the political economy of the South. The mission of the school curriculum aimed to keep Blacks working in their natural environment. Politically, accommodationist education helped placate and unite the previously hostile Whites of the South with Northern aims.

The new century found expanding Northern industrialization accompanied by a stabilizing agricultural South poised to advance. Black education helped create a kind of semicitizenship, was instrumental in addressing regional tensions, and helped facilitate new demands on the labor market. The Northern corporate industrialists embraced the formula.

Increased philanthropic involvement affected course offerings. Monitors from corporate sponsored boards and committees chastised Black schools for offering classical languages and advanced mathematics. Survey data note that Black schools spread quickly in the pre-World War I

20th century. Teacher training within the accommodationist ideology dominated the curriculum.

The accommodationist idea was not unchallenged. In *The Souls of Black Folk*, W. E. B. Du Bois opposed Booker T. Washington as he argued for a liberal, perhaps social reconstructionist, curriculum where Black people could both know and change the world.

Anderson concludes with a discussion of the apostles of liberal culture. He describes the importance, tensions, evolution, and spread of higher education in Black life. Although missionary involvement in Black education differed from the socioeconomic vision of the corporate philanthropists, in the final analysis, both groups accepted Black inferiority and supported a curriculum that taught the Negro to understand his or her place in society.

## EFFICIENCY

---

In the field of curriculum studies, efficiency has come to be seen as the application of business principles to education—an attempt to prevent taxpayer waste while improving the performance of teachers and students. Readers might agree that this is an admirable aim, but many in education feel this desire for efficiency has translated into schools seen as factory plants rather than campuses, teachers viewed as teaching units, students seen as human capital, and learning seen as a product rather than as the acquisition of knowledge. The history of efficiency in education has its roots

in the progressive movement of the early 1900s and is in evidence today in the standards and high-stakes testing that is part of accountability in the early 2000s.

Raymond Callahan does the most comprehensive discussion of the application of efficiency's effects on schools in *Education and the Cult of Efficiency*. He traces the origins of the movement to Frederick Taylor's scientific management, a movement in the business world that was concerned with maximizing production while minimizing cost. This effect was to be accomplished through scientific observation based on task analysis of any given job an employer needed done to manufacture a product. Examples of the application of Taylorism in industry abound and even created a new career: the efficiency expert. Callahan illustrates the transition from business application to education by citing Ellwood Cubberley, a major leader in the new field of educational administration (i.e., leadership) in the early 20th century. Cubberley believed that schools are, in a sense, factories. The raw materials (i.e., children) are to be shaped into products. The specifications for manufacturing come from the demands of civilization, and it is the job of the schools to build students to the specifications laid down by the public. Cubberley believed that this would demand good tools, specialized machinery, continuous measurement of production, and the elimination of waste in manufacture. This view of schools has pervaded the thinking of school administrations from the beginning of this strand of progressivism until today. Importantly, curricular reforms falling under the term efficiency movements have been widespread in countries such as Canada, the United States, Australia, New Zealand, and the United Kingdom. Thus, the application of business principles to education had, and continues to have, proponents around the globe.

Today efficiency is best evidenced by the move to standards, testing, and accountability as illustrated by the No Child Left Behind Act. Schools that underperform are closed rather than targeted with extra funds for improvement. Success is defined by the ability to quantify performance. Thus, knowledge is standard, acquired, and regurgitated on high-stakes tests that state departments of education have graded by external businesses rather than by trusting teachers to evaluate student

progress. Further, some authors believe that even the privatization movement in schools is evidence of efficiency due to the belief that competition, a business model in capitalist countries, will yield the most efficient (i.e., effective) schools—in economic terms: maximum bang for the buck! These business models have included consumerism on scoreboards, restrictions on vending machine brands, Channel One with its free televisions in return for forcing students to watch commercials, and outsourcing school cafeterias to fast food companies—all in the name of the efficient use of taxpayer dollars.

Taylor believed that each business required extensive onsite research in order to draw up a plan that would assist that manufacturer to increase efficiency. Many in the field of curriculum studies argue that the simple reduction of students to raw materials and teachers to producers of education removes the human element from schooling. For the curriculum field, the solution is to redefine efficiency in conceptual terms that incorporate not only economics, but also include humanistic and democratic goals. Then taxpayers could feel satisfied that schools were aware of economics, and schools could achieve the true aims of education.

## EIGHT YEAR STUDY, THE

---

The Eight Year Study (1930–1942) sought to articulate the relationship between high school and college curricula and to reconceive the purposes of secondary school education. Sponsored by the Progressive Education Association (PEA)

and funded by the General Education Board of the Rockefeller Foundation, this national project, also known as the Thirty School Study, consisted of three PEA commissions and full-time staffs who worked directly with the faculty of 42 high schools and 26 junior high school programs. Through “exploration and experimentation,” what became a motto for the study, the Commission on the Relation of School and College (formed in 1930 and chaired by Wilford Aikin) addressed how the high school could serve youth more effectively. The Commission on Secondary School Curriculum (chaired by V. T. Thayer and formed in 1932) designed curriculum materials in the areas of general education: science, mathematics, social studies, arts, and language and recognizing that further study of youth needed to be undertaken, established the Study of Adolescence project, coordinated by Caroline Zachry. The Commission on Human Relations (formed in 1935 and chaired by Alice Keliher) prepared social science–related curriculum materials, incorporating the then innovative use of motion pictures, and examined human problems faced by youth. The commissions’ research, publications, and implemented programs conceived and transformed educational practices in the fields of curriculum studies, instruction, teacher education, educational research, and evaluation.

The Eight Year Study offered participating schools the opportunity to redesign their general education curricula from a separate subjects–discipline configuration to an integrated core curriculum (typically incorporating what was called a fused or broad problems core). New curricular materials were required for these programs, and commission staff worked with teachers during 6-week summer workshops to develop resource units, a type of curricular material that offered great flexibility for use in the classroom. Participating school faculty at the more experimental schools practiced teacher–pupil planning (also called cooperative learning) where students and teachers were developing resource units and acquiring materials from resources in the community. The core curricula, resource units, and teacher–pupil planning conceived learning as a series of experiences, balancing student interests with societal and educational needs. The Eight Year Study schools participated in an extensive student testing and

assessment program with a battery of sophisticated tests and inventories assessing student knowledge, skills, beliefs, and values.

One of the most overlooked aspects of the Eight Year Study was its work to use and popularize psychoanalytical discourse at the secondary school level. Caroline Zachry of the Thayer Commission’s Study of Adolescence helped to introduce the use of psychoanalysis as a form of professional development and as a method for teachers to develop insights and new sensitivities toward students. Thayer and Keliher Commission staff included Peter Blos, Erik Homburger (Erikson), and Walter Langer, all of whom worked with Sigmund Freud in Vienna and prepared project reports and materials merging the use of depth psychology with cumulative student records. In what became known as the Zachry Seminar, Eight Year Study staff and teachers would present student cases and analyze motives as a way for participants to reconsider their fundamental educational beliefs.

To correct a popular misconception of the Eight Year Study, the Aikin Commission’s Follow-Up Study (of college success for 1,475 pairs of students) was not the sole purpose of the experiment. Many of the participating schools did not embrace the spirit of experimentation or engage in serious innovation, but the Follow-Up Study, what now commonly defines the Eight Year Study, followed many of the wrong students—those who graduated before secondary school experimentation was even fully underway. Recognizing that great variation existed among the participating schools, the Aikin Commission initiated the study within the study where 323 students’ college records from the six most experimental schools were examined and compared with student records from traditional school matchees and to students from the other Eight Year Study participating schools. These students substantially outperformed their peers on virtually all measures of college success, suggesting that schools could experiment with curriculum design without jeopardizing the future academic success of their graduates.

Another contemporary misconception maintains that the project had no impact on secondary education. The Eight Year Study is the most well-known example of cooperative study. With its participating high schools and junior high schools, this project helped to initiate other cooperative

school study projects during the 1930s and 1940s, including the Cooperative Study in General Education (1939–1945), the Secondary School Study (1940–1947), the Southern Study (1938–1945), the Michigan Secondary School Curriculum Study (1936–1948), and the California Study of Cooperating Schools (1934–1939). Although the Eight Year Study did not eliminate the use of the Carnegie Unit for secondary education in the United States (which was never its originally stated intent), the participating schools displayed a variety of conceptions and practices that greatly influenced the fields of curriculum and instruction, evaluation and assessment, educational technology, professional development, educational policy and leadership.

In addition, the Eight Year Study was not named for an educational experiment that was conducted for 8 years. If funding had been available, the project would easily have continued for 20 years. Eight years referred to the period of interest of the researchers—4 years of high school and 4 years of college—and their efforts to ascertain forms of articulation between the secondary school and college curricula. Other inaccuracies include the spelling of Wilford Aikin's name, which is often misspelled as Aiken.

A careful examination of the mid-to-late 1940s curriculum planning literature calls into question the generally accepted belief that World War II prevented the Eight Year Study from influencing the U.S. curriculum. With the release of the first final report in December 1942, the events of World War II certainly turned attention away from curricular experimentation. Yet, what may have exerted much more pressure and served as a deterrent for school reform was the release of the 1945 Harvard Redbook, *General Education in a Free Society*, which justified the importance of general curriculum and then recommended that high schools maintain a separate subjects–Carnegie Unit high school program, further establishing the strength of the traditional high school disciplines. Few publications have received such national attention as the Harvard Redbook, and its message to high school administrators served to negate the recommendations of the Eight Year Study and further, to confirm that the current secondary school curriculum was philosophically and programmatically acceptable in its traditional form.

The overall intent of the Eight Year Study was not to promote a progressive education curriculum or to compare administrative progressives with pedagogical progressives. Instead, the more successful experimental schools were guided by a unique group of Eight Year Study progressives, who were academically oriented while also recognizing the importance of focusing curricula around the interests and needs of students. Distinct from administrative and pedagogical progressives, social meliorists, and child-centered progressives, Eight Year Study progressives viewed student needs as both personal and social in nature and not merely as expressions of individual interests. Configuring their schools around a conception of democracy as a way of life, they introduced a carefully designed practice of teacher–pupil planning, core curriculum, testing, and program assessment and stressed the importance of disciplinary knowledge. The Eight Year Study proved the importance of educational exploration and served as an experiment in support of school experimentation, implicitly asserting that a healthy school was an experimental school.

## EISNER, ELLIOT

---

Elliot W. Eisner is widely regarded as one of the most prominent and influential U.S. curriculum theorists and arts educationists of the 20th and 21st centuries. Eisner's most significant contributions to the field of curriculum studies pertain to his interests in the cultivation of perception and the promotion of new conceptions of literacy within multiple forms of representation. These interests were central to his lifelong advocacy of the importance of aesthetics and imagination in the general school curriculum; in the curriculum design process; in teaching; in approaches to curriculum research, evaluation, and assessment; and in the transformation of the public school. This entry focuses on Eisner's academic training and educational positions, his primary contributions to curriculum theory, and the awards and honors he achieved.

### Educational Degrees and Academic Positions

Eisner's interests in arts education and curriculum studies were evident early in his career. In 1954, he received his bachelor of arts degree from Roosevelt University in art and education and a year later a master of science degree (in art education) from the Institute of Design at the Illinois Institute of Technology. Eisner taught art for 2 years at a Chicago high school and then successfully pursued a master of arts in education (1958) and a doctorate of philosophy in education (1962). Both of these degrees were from the University of Chicago, where he also taught art at the Laboratory School. After a 3-year stint as assistant professor at the University of Chicago, Eisner was recruited by Stanford University as associate professor of education and art. There his career flourished for over four decades until his retirement in 2006 as Lee Jacks professor of education and professor of art.

### Primary Achievements in Curriculum Theory

For over four decades, in his writing, teaching, and public speaking, Eisner's emphasis on the

aesthetic in curriculum and schooling ran counter to dominant scientific, industrial, and technocratic currents.

Early on, Eisner challenged the behavioral objectives movement of the 1960s, objecting to the notion that all intended learning outcomes must be formulated by curriculum planners in advance of student engagement in an educational activity. Initially labeling his alternative to behavioral objectives as *expressive objectives*, Eisner later coined the term *expressive outcomes*. An expressive outcome was the result of an engagement in an *expressive activity*, within which emerge student purposes. Eisner argued that the unpredictable, emergent outcomes of such activities would and should vary in accordance with the cultural and personal background of the individual student.

A similar argument was later found in his objections to the standards movement that swept the United States, beginning in the 1980s. For the educational community and general population, the definitions of an educational standard were usually elastic, fluid, and vague. Eisner, however, called attention to the origins of the term within the scientific management movement begun by businessman and consultant Frederick Taylor and extended to the field of education through the work of Franklin Bobbitt. Bobbitt equated curricular standards with the standardized measurements of physical objects (steel railroad rails, in particular). For Eisner, therefore, standards (like objectives) implied a rigid, static conformity in learning that was harmful to the development of the imaginative faculties of students and to what he called *productive idiosyncrasy*. Without this quality, he contended, students were less likely to contribute productively to society in a manner suited to their unique personalities.

These ideas located Eisner within the tradition of John Dewey, who saw curriculum planning as largely an organic, holistic, emergent process that fostered a wide range of student meanings. Dewey's emphasis on personal relevance and growth within a larger culture (and school curriculum) was present in an early book by Eisner (coedited with Elizabeth Vallance) that mapped the curriculum field through five conflicting conceptions of curriculum. Eisner's own curriculum ideals partially rested within a kind of cognitive pluralism, a belief that the curriculum must foster

in students an array of capabilities and intelligences that partook, in fact, of both human cognition and emotion.

Pluralism of a methodological sort was evident in Eisner's groundbreaking arts-based approach to curriculum evaluation and educational research. Eisner originally called this approach *educational criticism*. The term implied that evaluators may study and disclose the wide array of meanings within various educational and curricular phenomena (curriculum materials, teacher and student encounters, school architecture, etc.) in the thickly descriptive and interpretative manner of an art critic. The later term art-based more explicitly emphasized the possibility of employing a wide variety of art forms for inquiry and data disclosure purposes.

### Awards and Honors

Eisner's most influential curriculum publications were the three editions of *The Educational Imagination: On the Design and Evaluation of School Programs* (1979, 1985, 2002). But this work was only part of a large body of important articles, book chapters, and presentations at professional venues. Recognition of his achievements resulted in many honors and awards. These included honorary doctorates at several universities and colleges worldwide, election to the presidencies of premier educational organizations such as the American Educational Association and the National Art Education Association, and prestigious awards such as the Harold McGraw Prize for Excellence in Education and the Brock International Prize in Education.

## ELEMENTARY SCHOOL CURRICULUM

---

The elementary school curriculum in the United States has long been shaped by societal forces since its original inception in the colonial era. Although the goal of this entry is not to provide an extensive review of historical roots or an exhaustive description of current trends, it does provide an overview of some of the major developments, issues, tensions, and ideas that have greatly impacted and influenced the field.

The scope and sequence of elementary school curriculum are formed by underlying philosophical beliefs and specific ideas about what skills children need to master by a certain age or developmental phase. Today the typical elementary school curriculum is commonly organized on broad areas such as mathematics, language arts, physical education, science, and social studies. This approach is designed to cover a variety of content areas while at the same time facilitating skill and capacity development. As is true of other Western nations, the elementary school curriculum in the United States has had many goals, including instilling civic responsibility, social skills, self-realization, academic skill, and economic efficiency. Scholars also suggest that elementary schools have also had the goal of assimilating children into White cultural norms and of sorting and tracking children from historically marginalized groups into lower socioeconomic status careers. The primary goals of U.S. elementary curriculum have been shaped by historical events, societal values, and local contexts.

### Historical Overview

During the 1600s and 1700s, settlers in the North American colonies established schools that were originally modeled after the schools of their European homelands. This system was based

upon two tracks: one for upper classes and one for children who were of lower socioeconomic means. The first group attended preparatory schools with special attention on preparing White males for college. Schools for lower socioeconomic groups attended church-sponsored primary schools that offered basic subjects such as religion, reading, writing, and mathematics. During the late 1700s, Thomas Jefferson and Noah Webster promoted a movement to create a U.S. version of elementary education. Jefferson asserted that each state should be responsible for providing both females and males a basic elementary education that would be funded by the public. Although this was not established during Jefferson's lifetime, his ideas would have a significant influence on the future establishment of public elementary schools.

During the 1830s and 1840s, a movement started to replace or supplement church-based schools. Sunday schools were established in larger cities to provide religious and literacy education. A second form of schooling, mutual instruction commonly known as monitorials, became popular. This method involved a master teacher who selected older students to tutor and mentor younger students. This method was popular because it provided a relatively inexpensive way to provide a basic education for young children. Initially these schools were fully funded by private donors, but this funding eventually gave way to a public school system in the mid to late 1800s. These schools were purported to be open to all children regardless of socioeconomic status and ethnic background. However, many children were still denied access to schools, particularly those who were African American.

Although widespread, the common school movement was most strongly established in Connecticut and Massachusetts. Common schools were rare in the South until after the Civil War. Initially, most common schools were run in a one-room school house and were focused on basic curricular areas such as reading, writing, and arithmetic. Although some African American children attended common schools in the North, school access was limited until the U.S. Congress founded the Freedmen's Bureau, which created elementary schools for the children of freed slaves. Many of these schools operated until

1872 when the bureau closed down its operations. School access—and the denial of it—continues to be an issue that lives in public debates on schooling.

From 1890 through the 1930s, the Bureau of Indian Affairs ran boarding schools for Native American children that included an elementary unit. Along with a basic curriculum, the primary aim of these schools was to assimilate native youth into White culture. Some continue to question whether schools continue to assimilate children from a variety of cultures.

During the 1900s, the notion that schools are affected by outside influences such as social, political, philosophical, and economic matters began to be considered. Stanley Hall asserted that there should be more activity in the classroom and suggested the child study model of curriculum. This model emphasized that curriculum should be based upon student need and interest. John Dewey agreed that more active learning should be at the heart of the curriculum, but that activity should be meaningful and have a purpose. W. H. Kilpatrick, a student of Dewey's, created the project method, which involved allowing children to select purposeful activities. Although the teacher may select the problem to be solved or goal to be achieved, the children plan and execute the majority of project activities.

In 1983, the National Commission on Excellence in Education published the report *A Nation at Risk*. This report outlined the decline of the U.S. education system and encouraged a greater emphasis on accountability, academic preparation, and standardized curriculum. Building on these ideas, the No Child Left Behind Act, passed in 2001, required that children in Grades 3 through 8 be tested annually in math and reading; low performing schools be identified; and that parents can in some cases receive financial support for tutoring if their children are attending a low performing school. This act began heated debates about charter schools and vouchers. There is currently no national curriculum for elementary schools in the United States; curriculum is generally regulated by state and local districts. The emergence of the standards movement has significantly diminished local autonomy, which some assert is a positive event while other disagree.

### Curricular Issues

Curricular issues also center on content areas, including literacy and language arts, social studies, science, mathematics, physical education and health, and the arts. Each of these areas has its own set of challenges and possibilities for curriculum implementation in elementary schools.

Literacy and language arts has long been framed by the debate between the value of skills versus process or the phonics versus whole language debate. Professionals in this area, such as the National Council for the Teachers of English, assert that this debate unnecessarily divides the field and falsely defines literacy instruction. Rather than position this area on one side or the other, this group and others have attempted to create a common ground for discussion of this area of language and literacy. This perspective is based upon the idea that literacy forms a basis for communication, learning, problem solving and application, reflection, and literary response and expression. Moreover, language and literacy have recently been framed by discussions on how to best meet the needs of second language learners, the value of vernacular speech patterns and language usage (e.g., Black or African American vernacular), and how to facilitate culturally relevant ways to teach diverse students.

Social studies encompass a variety of areas of study including sociology, history, geography, political science, anthropology, and economics. The goals of social studies education are to gain process skills, explore social and emotional aspects such as feelings and values, and apply knowledge. Although social studies has been seen as a valuable curricular area, this subject often gets neglected or is seen as a topic to be integrated with other content areas.

Science courses engage children in both content and process knowledge. Inquiry-based science curriculum has become popular in elementary schools. This approach involves giving students some, but not all information. Key elements of an inquiry-based approach include hands-on activities, ample time to explore, flexibility, and posing high-quality questions.

Mathematics has been regarded as essential to students' success. Curriculum scholars are concerned about what should be emphasized in mathematics classrooms. They are concerned about

imparting useful everyday knowledge, the transferability of knowledge, and how to encourage students to see mathematics as a way of thinking and knowing. From this perspective, math is seen as a way of viewing the world rather than as a set of discrete skills. Along with these discussions, increases in standardized testing of mathematics have created heated debates among educators about what approaches to the teaching of mathematics are the most useful and effective.

Although childhood obesity rates are rising in the United States, physical education and health have been receiving less and less time in elementary school schedules. Physical education's low status leads to space constraints and overenrollment in physical education classes. Debates among educators in this field center on whether a physical education curriculum should be taught by a specialist or even if it can be taught by a generalist. The benefits of physical education are many; these include helping children to learn sportsmanship and health issues (e.g., the value of exercise) and to become coordinated in their movement. Elementary teachers, particularly those who work with young children, value movement as a foundation for learning. Jean Piaget, a Swiss psychologist, asserted that learning is a result of a child's interaction with his or her environment. Based upon this recommendation, many teachers incorporate physical education into their own curriculum. Such teachers consider both fine motor (e.g., cutting with scissors) and gross motor skills (e.g., jumping and skipping) as essential for children to master.

The areas of physical education and the arts have been losing ground in elementary schools due to limited funding and an emphasis on academics and standardized testing. Advocates for the arts often state that the arts deserve more time and attention in schools. Debates over what qualifies as art and what is the purpose of art education continue. Some believe that only fine art, predominantly generated by Western European artists, is of value. Others state a variety of cultural perspectives on what qualifies as art, or cultural art, should be included in the curriculum. There is also a debate over whether art should be included in elementary schools simply because art is of value or whether art should serve the purpose of being a vehicle for other content areas.

### Other Issues and Tensions

A number of other tensions and issues that are being discussed in the public forum concerning elementary curriculum center on how curriculum can meet individual student needs and how curriculum can address broader societal concerns. These issues include the achievement gap between historically marginalized students and those who have been privileged by the system, issues arising from increasing immigration rates, school violence, issues affecting children of poverty, technological advances, and inclusion of children with special needs.

There is a continued tension between two curricular approaches in elementary education: (1) a focus on critical thinking, reasoning, and application and (2) an emphasis on practice, drill, and memorization. This dichotomy is also characterized by the debate between standardized curriculum and active hands-on modalities. This tension begs the question of whether curriculum should be governed by standards and testing or whether the curriculum should generate tests and standards.

Another issue that has arisen in elementary curriculum has been as a direct result of the shifting demographics of our nation's student population. Over the last several decades, our school population has become more diverse while our teaching force has remained predominantly White, middle class, and female. This dynamic has resulted in the need for elementary educators to consider ways in which the curriculum can become more culturally relevant. Likewise, the persistent achievement gap between children from historically marginalized backgrounds and from White middle class backgrounds remains. These issues have placed issues of equity and diversity at the forefront of elementary curriculum.

In addition to cultural understanding, elementary curriculum creators continue to consider how to meet developmental needs of children. Over the last several decades, elementary teacher certification, in some states, has been reorganized from a kindergarten through 6th-grade licensure to a 3rd-grade through 6th-grade certification. This reorganization reflects the idea that early childhood consists of kindergarten through 3rd grade. Regardless of how childhood development is divided, most developmental models include three specific areas: physical development, cognitive

development, and social development. Piaget and his student David Elkind are two scholars who have generated foundational research and theoretical frameworks in this area. Both assert that children suffer when they are presented with curriculum that does not match their developmental levels. Critics of their approach suggest that a strictly developmental model does not appropriately consider issues of race, class, or gender.

A similar tension in elementary curriculum relates to the increasing number of elementary-aged children who are English language learners. Increasing immigration rates have caused elementary educators to consider issues of solely implementing English as a second language instruction or incorporating dual language programs in schools.

Societal changes such as increasing rates of single parent families, same-sex parent families, latch-key children, mental illness, technological change, homelessness, poverty, and family mobility have caused a need for elementary curriculum to consider the needs of a rapidly changing society. Elementary curriculum has been influenced and shaped by historical, political, economic, and philosophical influences. Thus, it has a reciprocal relationship with people in that it is shaped by the people who engage it, and in turn, the people who work in this area and ultimately the children who learn through it are also influenced by changes in elementary curriculum over time.

## EMBODIED CURRICULUM

---

*Embodied curriculum* is the curriculum that takes form and shape in the experiences of people and that ultimately becomes part of their lived experience. It puts emphasis on the body, which is regarded as the locus of perception and understanding of the world and the environment, including the classroom and the subject matter. The evolution of the term embodied curriculum takes on historical significance as it enables one to grasp the term curriculum from a strict body of knowledge to be learned independently of people's life experiences to a more liberal way of viewing knowledge and reality—that is, as a mutual and continuous construction and reconstruction and negotiation of what reality is and how it is experienced. This ability gives a new grasp of curriculum, one that considers the several factors that affect the way people view the world.

In a traditional sense, embodied curricula take form and shape in official documents and textbooks and in the knowledge to be learned and are made mandatory by departments of education. This shape and form, however, represents a disembodied curriculum, for it is connected to some external-to-the-self source. In contrast, contemporary literature and discourse on curriculum recognizes the importance of feelings, meanings, expressions, imagination, sensory-motor, and spatial experiences in understanding the world and how lived experience plays out in people's lives and how it becomes part of their curriculum. The incorporation of bodily experience in curriculum theory raises issues of objectivity and subjectivity of knowledge and reality and questions pertinent to what is known and what is supposed to be known by individuals. The notion that knowledge and reality are static and outside of the self is replaced by the view that the world is

also constructed in the way we experience it and understand it, a mutual exchange between reality and individual perception.

Embodied curriculum is to be traced in the progressive history of integrated and core curriculum argued by John Dewey in 1902 in his effort to eradicate disembodied, externally imposed curriculum. The focus, he argued, should be on the creation of personal and public meaning through the connection of school curriculum with the lived curriculum of children. Constructivist approach, experiential learning, and learning by doing, all represent the embodiment of lived experience in the curriculum. Embodied curriculum is also traced in phenomenology, which is the study of lived experience, a connection nicely exemplified by Max van Manen. Embodied curriculum represents all that which contributes to and comprises a deep understanding of the meaning of everyday experiences. This understanding is further stretched out in the work of William Pinar, who aesthetically imagined *currere* as a core of curriculum inquiry, a reading and writing of the self in relation with the world.

Later on, in 1980s, scholars connected the notion of embodied curriculum with feminist literature, an extension of the curriculum reconceptualization movement. Janet Miller, working with autobiography, explored relationships among gender identity, the self, and others and how these relationships are embodied in the breaking of silence, which is the silence of women's experience. In examining conversations with women, Miller studied the way larger social imbalances of control and power, hierarchy, and imposition are part of these women's lived experiences, and it is manifested in their gender. Also, the work of Madeleine Grumet, informed by psychoanalysis, phenomenology, autobiography, political, and feminist theory, illustrates that knowing resides in intersubjectivity. Grumet also exemplified the importance of gaze and touch, which internalize experiences, making them part of one's lived experience.

Embodied curriculum focuses on the role of the human body in understanding the external world. Mark Johnson's work on the body in the mind and the mind in the body and his arguments about objectivity and subjectivity create another dimension to the way curriculum, knowledge, and reality are understood. Objectivity points out the

uniqueness and authenticity of knowledge that accepts no other meaning than the one externally imposed, whereas subjectivity accepts the body as the locus of complex meanings and interactions with the environment. Educators, despite the testing and standards implemented by official mandates and curricula, are called to make use of theirs and their students' bodily experience and to challenge the several meanings generated by the way reality is individually understood, partly due to the constraints of the sensory-motor activity of the body.

## EMPIRICAL ANALYTIC PARADIGM

---

The empirical analytic paradigm in curriculum studies derives from intellectual traditions of empiricism and philosophical or conceptual analysis. Empiricism refers to derivation of knowledge from experience, usually by scientific inquiry, and the analytic tradition in philosophy gives careful attention to definitions of concepts and related dimensions of language. Thus, the empirical analytic paradigm in curriculum studies bespeaks this orientation applied to curriculum matters.

The curriculum field began at the onset of the 20th century with an orientation to inquiry that melded everyday problem solving with prescriptive philosophizing derived from an amalgam of philosophical traditions: realism, idealism, scholasticism, naturalism, and pragmatism. Based on these origins, curriculum inquiry prior to 1950 was

geared primarily toward developing and revising curriculum for schools. In the 1950s, when normal schools, the main purveyors of teacher training, sought credibility in academe and joined with 4-year colleges and universities, they felt obligated to become more research oriented. Thus, they moved from what William Pinar has labeled traditionalists to conceptual empiricists. Conceptual empiricists utilized forms of inquiry from the empirical analytic paradigm. Enamored by successes in science and technology, they attempted to develop a science of education and more specifically of curriculum development and design. Thus, they patterned their inquiries after natural sciences and developed research, development, and dissemination models. By the late 1960s and throughout the 1970s, scientist and curriculum theorist Joseph J. Schwab thoroughly critiqued this move to achieve intellectual credibility. He argued that these would-be researchers used a language of inquiry that did not fit the kinds of problems faced in curriculum. Using Aristotle's distinction between theoretical and practical inquiry, Schwab castigated advocates of conceptual empirical or empirical analytic inquiry as being too theoretic in the sense that theoretic meant starting from a problem source in the state of mind of researchers, one that defines problems across many situations based on similarities and ignoring differences that make the situations unique. He argued for practical inquiry that focused on actual states of affairs separately, not unwarranted generalizations. Similarly, he criticized the method of inquiry that can be characterized as induction and hypothetical deduction for fostering generalized knowledge and misguided attempts to derive laws of education akin to laws of gravitation or motion in physics. Instead, he advocated inquiry through interaction with situations and their contexts or milieus and said that practical inquiry is content with situationally specific insights. Finally, he criticized the end of theoretical, conceptual empiricist, and empirical analytic inquiry for seeking knowledge qua knowledge, or more sarcastically, for the sake of publication only, and he advocated ends of knowledge that provide ethically and politically defensible decision and action.

Schwab's critique of empirical analytic inquiry was shared by many, and in the 1970s, he warned on many occasions of the inappropriateness of

mimicry of natural sciences. In fact, he contended that the mimicry was based on vastly delayed understanding. For instance, the statistical empiricism adopted and adapted by social scientists and educational researchers in the early 20th century was already outmoded for natural sciences, which had moved into more theory-oriented work, and by the time social scientists and psychologists took up theory, natural scientists had moved to situational analysis, which is akin to the practical inquiry that Schwab advocated for the curriculum field. Schwab also criticized the propensity for specialization that narrows perspective and is a strong feature of empirical analytic work. He declared that specialists in related disciplines (education, sociology, anthropology, psychology) are unaware of relevant knowledge among such disciplines. He considered it even more harmful that researchers in subdivisions within disciplines or areas of study are unaware of insights in adjacent subdivisions (e.g., cognitive, clinical, development, behavioral, and psychoanalytic psychology). Finally, he railed against the propensity of educational researchers to seek credibility at even the cost of integrity, instead of creating inquiry that fits the subject matter with which they need to inquire.

The critiques by Schwab, Pinar, and others offered alternative paradigms of inquiry through which curriculum studies could engage a richer range of understandings. Schwab called for practical, quasi-practical, and eclectic forms, while Pinar and others called for reconceptualization of inquiry by pursuing discourse communities that focus on history, political economy, race, gender, biography, autobiography, aesthetics, phenomenology and hermeneutics, deconstruction, postmodern perspectives, theology, and international perspectives. In a current postparadigmatic context, curriculum studies today does not rely on one guiding paradigm. It flows among many depending on the kinds and qualities of inquiry being pursued.

Within this broader perspective, empirical analytic inquiry remains an important form of inquiry; scholars are able to tap its strengths and avoid its limitations. Positively, it can be argued that this is the form of inquiry that brought humanity many benefits, from wonder drugs to skyscrapers, from elevators to air conditioning, from the printing press to the personal computer. The networks of transportation, communication, and health services

that have derived from empirical analytical inquiry can hardly be denied. However, neither can the misuses of testing in education and societal sorting, instigation of war materials and involvements, devastation of the environment, and corporate colonization of myriad impoverished areas of Earth. These, too, have been enhanced by empirical analytic inquiry.

Nevertheless, the central method of empirical analytic inquiry is very much alive and continues to have great influence. The method involves the following: experiencing a felt need for overcoming a dilemma, conceptually clarifying dilemmas into a problem that can be investigated, systematically investigating the context of problems, surveying literature and professional expertise to gain all knowledge associated with a problem in question, formulating hypotheses or educated possibilities for resolving the problem, imagining the consequences of acting on the hypotheses, selecting and applying the hypothesis that seems to have greatest potential to solve the problem, studying the intended and unintended effects of the application, and revising to forge even better resolutions.

Such empirical analytic work requires acceptance of values of validity, reliability, objectivity, and replicability. It posits principles of control and certainty that adherents to other paradigms do not accept. It seeks law-like findings while realizing that any counterexample can negate or falsify a generalization. To the chagrin of adherents of other paradigms, it assumes that empirical analytic methods of inquiry are value free, as are verifiable findings. Others, too, assume that empirical analytic inquirers accept the dominant view of social reality while multiple views potentially exist simultaneously. Empirical analytic inquiry values efficiency and parsimony, asserting that despite criticism this orientation to inquiry produces what works. As such, and despite the substantially increased acceptance of many different forms of inquiry, empirical analytic inquiry remains the dominant form of inquiry in educational research today. Clearly, it is the most widely touted orientation to research that serves as a basis for policy that influences curriculum; No Child Left Behind (NCLB) is an example. Criticisms of the empirical analytic paradigm may be focused more on misuses, such as in massive testing in NCLB, or in other simplistic interpretations, than it is on the

uses of science and careful conceptual analysis that accompanies empirical analytic inquiry at its best. Nevertheless, it remains open as to whether the phenomena with which curriculum studies is most fully concerned can be understood best through applications of empirical analytic inquiry or through other forms and the paradigms that facilitate them.

## ENGLISH EDUCATION CURRICULUM

---

Central to the intellectual field and professional practice of English education is a curriculum of great complexity. Although its focus might be defined simply in terms of reading and writing skills and experiences, the historical contest over the content, purpose, and process of English education demonstrates that literacy is inextricable from the complexities of culture, ideology, psychic life, and social power. Moreover, unlike other areas of the school curriculum, English education centers study the very language through which teachers and students communicate. Even when bound by reform efforts focused on the basics, therefore, the English curriculum is continuously unsettled and reshaped by the literacy practices and experiences that are its focus.

The complexity of curriculum in English education can be further understood when viewed through the lens of curriculum studies. Outside the field of curriculum studies, many limit the definition of curriculum to official school content. Given the present culture of schooling, therefore, curriculum is most often understood to be a standardized body of knowledge mandated by local, state, and national organizations and aligned with state and federal assessments. The field of curriculum studies, in contrast, has advanced a more expansive concept of curriculum. Curriculum scholars do speak to its institutional forms, but they also explore the symbolic implications of the concept, drawing attention to the lived experience, cultural context, ideological content, and social underpinnings of education.

In *What Is Curriculum Theory?* William Pinar argues that curriculum is a nexus of public and private discourses and experiences, a complicated conversation that includes but exceeds formal school knowledge. This metaphor is particularly apt for education in the English language arts. If educational reform efforts have diminished the conversation between practicing teachers and curriculum theory, teachers of English nonetheless remain concerned with the problems and possibilities of communication in various rhetorical contexts—concerned, in other words, with the complexity of conversation. English teachers may, therefore, be in a privileged position to renew the relationship between teachers and the field of curriculum studies and to show, as many curriculum scholars argue, that teachers and students are fundamentally agents of curriculum inquiry and development. The potential for teachers of English to deepen the conversations in which they and their students participate is evident in the current professional practice of English education.

In schools in the United States, teachers of English instruct students in their use of the English language, supporting their growth as readers and writers in personal, professional, social, and academic situations. To help students negotiate obstacles and experience success in their literacy development, English teachers draw from a broad range of cultural, theoretical, and methodological resources. As a result, curriculum in the English classroom is most often richly intertextual—that is, it represents the interplay among literature, film, music, plastic arts, and multimedia texts;

among theories of linguistics, literary criticism, rhetoric, composition, and education; and among a host of pedagogical strategies for teaching the language arts.

The academic field of English education shapes the curriculum both through the preparation and professional support of teachers and through its research into the teaching and learning of English. Professional development networks established through the National Council of Teachers of English (NCTE), the International Reading Association (IRA), and the National Writing Project also provide English teachers valuable support in their role as curriculum developers. By tapping into this support, conducting teacher research, and understanding their power to enrich and diversify the curriculum, teachers of English have significantly improved English language arts education.

Advancements in English education demonstrate that many teachers have attempted to transcend a tradition of rote learning focused on the formal features of language and an insular curriculum focused on White patriarchal culture. Literature instruction in schools, for example, increasingly foregrounds the personal experience of reading, the complex transaction between the reader and the text, and the value of texts that represent diverse cultural experiences. Many English teachers integrate a wide variety of textual forms in language arts education; along with developments in multicultural literacy, therefore, the inclusion of young adult literature, multimedia genres, and students' self-selected texts in the English classroom has significantly challenged the traditional canon of White male writers.

Current writing instruction has also moved beyond formalistic approaches to education. Once focused exclusively on the grammar, organization, and mechanics of writing products, writing instruction in schools now frequently supports students' idiosyncratic and recursive moves through the writing process. Students in English classes now compose texts for multiple purposes and audiences, and they develop their writing skills through journal writing, peer review, visual mapping, and electronic communication. The formal elements of language study are more often contextualized in the processes of reading and writing. And many teachers help their students

understand the relationship between the dialects in which they speak and conditions of social power. Finally, in the English classroom, creative uses of computers, video technology, and the arts have helped students of English engage more deeply in the processes of research, social critique, and self-reflection.

Despite significant advancements in the professional practice of English education, teachers of English currently face the challenge of greater standardization of the curriculum. Unlike those standards of learning aligned with high-stakes tests, however, NCTE and IRA have provided nonprescriptive guidance for the development of English language arts curricula in their publication *Standards for the English Language Arts*. The complicated conversation that is the English language arts curriculum, therefore, is currently characterized by a tension between, on one hand, teaching students to master discrete and measurable literacy skills and on the other hand, teaching students to explore and integrate diverse ideas, experiences, textual practices, and cultural perspectives.

## ENGLISH EDUCATION CURRICULUM, HISTORY OF

---

The English education curriculum is the body of knowledge and experience that comes to form in the teaching and learning of English. Its sources are multiple. Various groups in the history of English education have argued for the centrality and even the primacy of a particular element of the curriculum—grammar, literature, or student experience, for example. The fact remains, however, that what comes to form in English education is a complex intermingling of discourses, practices, texts, social forces, and subjective experiences. The history of this curriculum is revealed in the way it has been defined from various perspectives over time. The following account represents major trends in the conceptualization and institutionalization of the English education curriculum, highlighting key developments in theory and praxis as they occurred chronologically.

The teaching of English in the United States can be traced to forms of literacy education that existed in classical antiquity and in the Middle Ages. But the historical events that have most influenced English education in the United States occurred as the nation developed, as educators taught reading and writing in colonial dame schools and in the common schools of the 19th century, conceptualized English as a discipline and school subject, expanded the English curriculum during the Progressive Era, and struggled to understand the teaching of English in the wake of numerous competing educational reform movements.

### Early Instructional Texts and Practices

Literacy instruction in the early years of the country reveals ideas about language and learning that continue to influence English education today. Elementary reading instruction, for example, has origins in the use of religious primers in the 17th and 18th centuries. The earliest primers in English were translated from Latin devotional texts, and over time they were integrated with ABC spellers, thus formally linking moralistic content and basic language instruction. In the U.S. colonies, *The New England Primer* was the most successful of these instructional texts. First published around

1688, it was the predominant form of reading instruction for over a century. Noah Webster's language books appeared in the late 18th century, *The Blue-Backed Speller* becoming the most popular. With these texts, Webster sought to standardize spelling and pronunciation, to establish a uniquely U.S. English, and to foster patriotism and ethics in youth. McGuffey Readers, first issued in 1836, were also influential in the history of reading instruction. Leveled readers designed for multigrade level classrooms provided elementary students with moralistic content in excerpts from informational and literary texts, further defining reading instruction as a process of inculcating ethical and cultural values.

In his seminal historical study *Tradition and Reform in the Teaching of English*, Arthur Applebee elaborates on the way these early instructional texts and practices represent beliefs that surface in various ways throughout the history of English education. Moreover, Applebee charts the development of English teaching from disparate forms of language instruction, through the formation of the discipline, to the professional practice of the 1970s.

The educational practices that would eventually coalesce in the discipline of English found legitimacy in the secondary schools and colleges of the 18th and 19th centuries by upholding the theory of mental discipline rooted in the faculty psychology of the time. Modeled on the grammatical study of classical languages, instruction in English grammar called for students to memorize rules, analyze sentences, and correct errors. Grammar achieved a prominent place in the curriculum because of its supposed exacting use of mental faculties and its apparent contribution to the effort to standardize U.S. English.

The study of written and oral expression, like the study of grammar, was guided by prescriptive, rule-oriented instruction during this early era of U.S. education. The college curriculum provided space for these rhetorical studies. Even as works of English literature found their way into this curriculum, the focus remained on their conformity with and deviation from rhetorical laws and principles. Literature, particularly modern literature, presented a challenge to instruction rooted in a classical tradition. Though it could serve as the object of rhetorical analysis, it did

not, of necessity, require the student's use of mental discipline. By engaging the imagination and by inspiring emotions, many believed, literature posed a threat to the order of reason, a perception of literature that would have to be surpassed for the discipline of English to fully emerge.

### English as a Discipline and School Subject

By the end of the 19th century, romanticism justified the ascendancy of literature to a form of knowledge that could restore cultural values. Published in 1867, Matthew Arnold's *Culture and Anarchy* praised culture as the collective fabric of human experience, inspiring U.S. educators to embrace literature as a medium for the transmission of culture and as a form of resistance to the destruction of traditional U.S. values. Philology provided the methodology perceived rigorous enough to support the civilizing study of modern languages. In 1876, the philologist credited with centering literature in the emerging discipline of English, Francis James Child, became the first professor of English literature in the United States.

In 1892, the Committee of Ten organized by the National Education Association formed subject matter groups to clarify the purposes of secondary education in the United States. The Conference on English undertook the tasks of providing coherence and balance to the various elements of the discipline (grammar, rhetoric, philology, literature) and aligning the English curriculum across the secondary and postsecondary levels. With its report in 1894, the conference established English as an official subject in the high school curriculum, emphasizing the now distinct and often conflicting dimensions of the field: communication and literature.

At this time, the National Conference on Uniform Entrance Requirements compiled a list of literary works to be included on college entrance exams, a practice that largely determined the content of the high school English curriculum until 1931. Protests against the use of these canonical lists led to the founding of the National Council of Teachers of English (NCTE) in 1911. Although founded in response to a particular policy issue, NCTE quickly moved to the fore of the profession and now shapes the breadth of research, policy, and practice in the field. NCTE's widely read publication *English*

*Journal* was first issued in 1912. In 1914, teachers of public speaking separated from NCTE to form their own professional organization, and in 1956, debates over elementary reading instruction led to the formation of the International Reading Association (IRA). IRA has since grown to address all aspects of the language arts, and it now publishes several influential journals. Finally, in 1949, the Conference on College Composition and Communication formed within NCTE to focus on the teaching of writing. Though initially directed toward teachers of freshman composition, the organization and its journal now address issues of writing instruction relevant to teachers throughout K–16 schooling.

### English Education in the Progressive Era

The Progressive Era in U.S. education—roughly the first half of the 20th century—was a period of fecundity in educational thought that fostered new perspectives on the school curriculum generally and on the English education curriculum specifically. Significant developments in the understanding of students, schools, and society expanded the field's concern with disciplinary subject matter to include the complexity of student experience. As John Dewey and Jane Addams advanced ideas about the essential role of education in the development of democratic society, they called attention to the range of experiences—cultural, socioeconomic, linguistic, and political—that inform the particular educational journeys of students. Research in the emerging field of educational psychology also drew attention to human development, inviting educators to consider how students' interests and developmental needs might become the foundation of curriculum and instruction. As a result, many educators began to value the goal of having students enjoy literature. While maintaining the argument for literature as a medium of moral education and cultural transmission, teachers sought to enhance the role of experience in these educative processes and began to look outside of the traditional literary canon for texts to include in the English curriculum. Modern texts in a range of genres found their way into the classroom, and literature created for students of particular age groups proliferated. Literature for adolescents, for example, found a strong advocate

in Dora V. Smith, who in the 1930s offered a course on the subject at the University of Minnesota and helped popularize the burgeoning genre.

Several curriculum models appeared during the Progressive Era that informed the teaching of English, including the project method, a framework for centering purposeful activities in the classroom, and the correlated curriculum, a design concept promoting the integration of knowledge and experience across different subject areas. In 1935, the NCTE Commission on the Curriculum, seeking to establish coherence among multiple popular approaches to English education, published the influential report *An Experience Curriculum in English*. Resisting curricular prescription, the commission articulated the value of educational units conceptualized as domains of experience that could be structured progressively and coherently within a school year and across grade levels. Significant outcomes of the report were a de-emphasis on formal grammar instruction, a deepening of concern with educational experience, and an increase in literature textbooks organized around experiential units. Over the next 20 years, these curriculum models would profoundly affect conversations among English teachers, providing a foundation for understanding the English curriculum as an integrated network of language arts. Criticism of progressive education in the 1940s and 1950s would eventually diminish efforts to enhance the experiential dimensions of the English curriculum. Among the critics was Mortimer Adler, who in 1940 published *How to Read a Book*, a work that popularized the Great Books curriculum and called for a return to the culture and discipline of the Western intellectual tradition.

Literary scholarship from this period has significantly shaped understandings of text and textual experience. I. A. Richards's influential *Practical Criticism*, published in 1935, was a precursor to both the new criticism and reader response movements in literature theory. In this work, Richards employed reader response methods, analyzing the reading strategies and interpretive struggles of his students; however, Richards is most often associated with an opposing theoretical camp, new criticism. The new critics, among them Cleanth Brooks and Robert Penn Warren, turned to Richards, even as they resisted his interest in reader responses,

because his practice of close reading supported their conception of the autotelic or self-enclosed text. Louise Rosenblatt's *Literature as Exploration* was published in 1938. A fuller conceptualization of literary experience than the one introduced by the Commission on the Curriculum, Rosenblatt's important work drew attention to the complex emotional and aesthetic experience that subtends any individual's reading process. Although new criticism remains influential today in instructional practices that emphasize the formal elements and purportedly determinate meanings of texts, reader response theory now also significantly informs the curriculum, as many teachers of English across all grade levels invite students to explore the subjective and social character of their literary experiences.

### Curriculum Reform: 1950s to the Present

The National Defense Education Act of 1958, prompted by the Soviet launch of *Sputnik* and rising fears about deficiencies in U.S. education, focused on improving education in science, mathematics, and foreign languages. NCTE's Committee on the National Interest, however, eventually compelled Congress to provide funding for English by pointing to insufficiencies in the preparation of English teachers. English, nonetheless, remained lower in a curriculum hierarchy dominated by math and science as leaders in the field of English education attempted to define the subject as a specific body of knowledge.

In the wake of Jerome Bruner's 1960 publication *The Process of Education*, the Commission on English organized by the College Entrance Examination Board attempted to define Bruner's concept of the structure of the discipline. The commission's report emphasized a conception of the English curriculum that remains influential today: the tripod curriculum of language, literature, and composition. Another reform project of the 1960s that followed Bruner's theoretical framework was Project English. Sponsored by the U.S. Office of Education, Project English created centers at several universities for research, curriculum development, and teacher preparation in the field of English education.

For many teachers and scholars, the Anglo-American seminar on English education held at

Dartmouth College in the summer of 1966 represents a significant turning point in the history of the field. Funded by the Carnegie Corporation, the seminar involved leading scholars and teachers from the field of English education in the tasks of defining the subject of English and determining how it should be taught. The Dartmouth Seminar represented diverse perspectives on the field and initiated a dialogue of such complexity that no consensus on the definition of English could be reached. The conference, nonetheless, came to symbolize the movement away from a formalistic English curriculum, focused on a literary canon and language structures, and toward a personal growth model of language use, centered on expressive writing, creative process, and subjective responses to literature. In 1967, John Dixon reported his perspective on the conference in *Growth Through English*. An era of experimentation in English education that began at Dartmouth continued through the 1980s as teachers explored a range of whole language, reader response, and writing process pedagogies.

As these new orientations to English education took hold, significant critiques emerged. Critical theorists, for example, identified the personal growth movement's neglect of the social and political contexts of language use, while traditional educators attempted to reestablish the view of English as a specific body of knowledge and skills to be transmitted to students. In the midst of these tensions, *A Nation at Risk* and related reform efforts found teachers largely culpable for the failure of U.S. schools. Rather than providing opportunities for exploring and expanding the English curriculum, these reforms have caused English teachers to become entrenched in issues of standardization, testing, and accountability. Given these challenges, the history of English education is worthy of much study, for it is through such study that teachers of English will find as yet undisclosed patterns, tensions, and ruptures in the field opportunities—that is, for shaping and understanding the English curriculum now unfolding in the 21st century.

## ENVIRONMENTAL EDUCATION

---

Environmental education emerged in the 1960s as the term for the educational dimensions of the environment movement that, at that time, was concerned about air and water quality (pollution), the growth in world population, continuing depletion of natural resources, and environmental degradation. Early definitions were framed as being aimed at producing citizens that are knowledgeable about the biophysical environment and its associated problems, aware of how to solve these problems, and motivated to work toward their solution. Some proponents trace the roots of environmental education in the United States to conservation education and the liberal–progressive educational philosophies of, for example, John Dewey. Much of the activity in environmental education in the United States continues this tradition,

and some writers attempt to truncate discussion of any alternatives.

### Objectives and Guiding Principles

Curriculum objectives relating to awareness, knowledge, attitude, skills, and participation have been continuing themes in the development of the field of environmental education. One change of emphasis, however, has been in the scope of the environmental focus that has shifted from the biophysical environment to the total environment—natural and built, technological and social (economic, political, technological, cultural-historical, moral, aesthetic)—to the three pillars of sustainable development—environment, society, and economy.

In the 1970s, as a result of the 1972 United Nations (UN) Conference on the Environment, the formation of the UN Environment Programme (UNEP), and several United Nations Educational, Scientific, and Cultural Organization (UNESCO)–UNEP intergovernmental conferences on environmental education, a set of goals and objectives for environmental education were agreed upon that have continued to form the fundamental principles for the field. However, through successive UN meetings, environmental education has evolved over past decades to have a contentious relationship with the more recently described area of education for sustainable development.

Environmental education has been interpreted as both curriculum product and curriculum process. It requires a change in the curriculum content to include the knowledge and skills that were seen as an essential component of the area, but it is also a way of learning associated with changing attitudes, behaviors, and participation in society.

A complicating factor for environmental education as both a product and as a process has been that it does not neatly fit into any traditional subject areas of the curriculum, and its interdisciplinary or multidisciplinary nature has meant that it has often been marginalized in traditional schooling as a result.

Although there was an apparent consensus about the goals, objectives, and guiding principles for environmental education in the period immediately following the 1977 Tbilisi UNESCO–UNEP intergovernmental conference, this consensus also

included a dissatisfaction with what had been produced, a dissatisfaction that subsequently led to a variety of contestations about the field. These contestations include the nature of the view of curriculum appropriate for environmental education, how environmental education is implemented in the formal curriculum, truncation of discussion on the nature of environmental education, the implications for education of the holistic nature of environmental problems, and the socially constructed nature of the environment and of education.

Some of the contestations had also occurred during the preceding 1975 Belgrade UNESCO–UNEP international workshop on environmental education. For example, many of the authors of position papers, who were mostly from the developed world, reflected the biases of educational structures and environmental concerns of their countries. Their papers were about the curriculum and needs of environmental education without reference to the nature and special characteristics of the environmental situation itself: for them, environmental education was like any other subject or new theme in the curriculum. However, other participants from the developing world drew attention to the *raison d'être* of environmental education being the world environmental situation and that the characteristics of that situation—not those of traditional education—should provide the framework and criteria for this education.

### Curriculum Approaches

Increasingly through the years since the Tbilisi and Belgrade meetings there has been discussion of an appropriate educational paradigm for environmental education. Although many persist in trying to accommodate environmental education within a traditional view of the curriculum, others have argued that there is a need for a different approach.

In his 1972 Ohio State University doctoral dissertation (published in book form in 1979), Arthur Lucas proposed a model for environmental education as being education in, about, and for the environment that has become a mantra for the field. Subsequent discussions highlighted that while education for the environment most characterizes the intent of environmental education as being about motivating people to resolve environmental problems,

this is readily converted to education about the environment at the classroom level and incorporated into the traditional curriculum. Environmental education as education in the environment or about the environment became common in school curricula in the Western world in the 1970s and 1980s. Environmental education as education for the environment and with environments developed more in the 1990s with the growth of socially critical education.

In the 1980s, an ERIC/SMEAC survey of U.S. state education agencies requesting information about how schools include environmental topics in their curricula found that environmental education is generally accomplished through infusion or insertion of discrete topics in association with science curricula, although a range of possible positions and mechanisms is possible. The more traditional forms of environmental topics—nature study, outdoor education, and conservation education—were commonly noted, although energy education occurred more often.

A well-known example of this type of environmental education is Earth education, as developed by Steve van Matre during the 1970s. This “green” approach is a self-proclaimed alternative to environmental education that aspires to be the educational arm of deep ecology. It aims to help learners build a sense of relationship with the natural world and to directly interact with the living things around them. Earth education programs and activities encourage the development of sensory awareness and ecological concept building with particular emphasis on the big picture in understanding life. Earth education explicitly rejects the shallow environmentalism of much conventional nature study and seeks instead to develop the kind of identification of humans with nature to which deep ecology aspires.

In contrast with the individualistic approach of Earth education, a socially critical curriculum is conceived as engaging students in social problems, tasks, and issues and giving them experience in critical reflection, social negotiation, and the organization of action, both individually and collectively. In a socially critical curriculum students are engaged in social practices and social structures immediately and not merely prepared for later social participation. The emphasis is on society and the individual in society rather than just the

individual and is therefore a more “red” than green approach to ecopolitical action. The rhetoric of environmental education uses similar language. For example, UNESCO publications from around 1980 argue that environmental education should adopt a critical approach to encourage careful awareness of the various factors involved in the situation, involve students in planning their learning experiences, utilize diverse learning environments and a broad array of educational approaches to teaching and learning, and provide opportunities to be actively involved at all levels in working toward the resolution of environmental problems. Thus, environmental education has increasingly been seen by some of its proponents as concerned with developing a curriculum that encourages the practice of just, participatory, and collaborative decision making and involves critical analysis of the development of the nature, forms, and formative processes of society generally and of the power relationships within a particular society.

Critical pedagogy and critical curriculum theory have been subjected to criticism from a number of different perspectives. Chet Bowers, for example, has criticized critical curriculum theorizing for being anthropocentric and for ignoring ecological imperatives, for accepting Cartesian dualism (thus separating mind and body, man and nature) and for failing to adopt a holistic perspective, and for emphasizing personal empowerment through individual rational critical reflection while discounting the influence of tradition and culture.

Environmental education has also had a close, but uneasy relationship with science education for much of the past four decades. Since its earliest inceptions, proponents have asserted that environmental education should become an essential part of the education of all citizens because they need an understanding of their environment and because society needs a scientifically literate nation. The importance of citizens having ecological understanding continues to the present day as part of the goals of education for sustainable development. However, while environmental educators recognize this relationship, many science educators do not.

During the 1980s, many environmental educators recognized that the implementation of environmental education within the formal curriculum was not a simple task as it did not fit the traditional social reproduction curriculum. Its approach was

seen as being interdisciplinary, which was difficult enough, but it was also concerned with values and providing social groups and individuals with opportunities to be actively involved in working toward resolution of environmental problems, which science (and many other) teachers did not feel confident to handle. Many people persisted in trying to make it fit by leaving out the difficult bits of values, participation, and decision making, but retaining the relatively uncontroversial ecological content.

One trend in the developing practice of environmental education in schools has been for teachers to begin by teaching about the environment (usually in a classroom setting). They may then progress to teaching both about and in the environment by going outdoors to investigate environments through such activities as data collection. They may also progress to teaching for the environment by working with students on local environmental action projects. A more radical socially critical pedagogy that encourages learning with environments has also been suggested. However, the involvement of students in environmental action is not yet common practice. The timidity of many teachers and schools in this matter is understandable (because environmental problems are invariably politically sensitive), but their fears are often groundless.

Many writers have recognized that environmental education is not achieving its overall aims, let alone its ecopolitical action aims, and have proposed alternative strategies. Proposals have come from both the red and dark green ends of the ecopolitical green spectrum. The red end (so labeled for its neo-Marxist affiliations) includes supporters of a socially critical orientation for environmental education. The dark green end includes those whose vision of environmental education is informed by the values of deep ecology. A feminist perspective on environmental education has also been developed that spans the spectrum from blue (so named for its conservative affiliations) through red to dark green.

Proponents of environmental education have seen it as a movement that seeks to establish a new social order and promote the values that will hasten this change. As such it is more aligned with the social reconstructionist debate that saw schooling as changing rather than reproducing society. Such a view has continued with the 1987 World

Commission on Environment and Development report arguing that the world's teachers have a crucial role to play in helping to bring about the extensive social changes needed for sustainable development to be achieved.

### Ongoing Issues and Future Challenges

The ongoing issues and challenges for the future of environmental education are numerous, but some points are clear. First, the environmental crisis will not go away. Survey after survey indicate that there is sustained, and generally increasing, community concern about the state of the environment. Environmental groups, industry conflicts, and political confrontations over the environment are a constant feature of media reporting. And the scientific community continues to remind us that the environment is in a continuing state of degradation. Whether schools have as their curriculum focus social reproduction or reconstruction, the environment should be looming large in their agenda. There is some general agreement that confronting the environmental crisis requires dramatic changes in people's attitudes and behaviors toward the environment and that education has a key role in achieving these changes.

Even though there is widespread concern about the state of the environment, and although environmental education has been on the political agenda in many countries since the late 1960s, the field has continued to operate on the margins of formal education. For example, from its earliest days, educational administrators have seen the field as being more of a political priority than an educational one. Its changing status with respect to national, state, and local curriculum processes reflect changing political prioritizing of the environment as well as changing educational priorities, and its almost universal continuing uncertain status in the formal curriculum reflects its marginalization within the educational agenda.

The argument that environmental education is interdisciplinary—not fitting within the bounds of any traditional subject area in the curriculum—has also meant that no one particular subject area has owned it, and so it has often slipped between the cracks of the boundaries between the subject areas. Similarly, the arguments that it is concerned with critical analysis of society and involves political

action have meant that many have been unwilling to become involved in implementing environmental education program. Teaching about or in the environment seems a lot less controversial, but the rhetoric says that it is only when there is education for the environment that environmental education is actually happening. Yet further marginalization can occur through emphasizing the attitude and action components of environmental education rather than environmental knowledge, which can make some teachers uneasy.

In addition, policies and practices of environmental education have overlooked women through gender blindness, and this overlook is another aspect of its marginalization, as is the silencing of indigenous peoples in the discourses of environmental education. A further problem is the individualistic orientation of much environmental education, which has tended to marginalize the field through its focus on behaviorism and individual agency.

The shift from environmental education to education for sustainable development—2005–2014 is the UN decade of education for sustainable development—has even further confused the identity of environmental education and its placement in the curriculum. Although most would argue that we need it, many still argue about what it is and where it can fit into an already overcrowded curriculum.

## EQUALITY OF EDUCATIONAL OPPORTUNITY

---

The *Equality of Educational Opportunity* study (EEOS), also known as the Coleman Report, was requested and commissioned by the U.S. Department of Health, Education and Welfare in 1966. The purpose of the Coleman Report was to assess the availability of equal educational opportunities to students regardless of race, color, religion, or national origin at all levels of public educational institutions in the United States. It addressed four major issues: (1) school segregation, (2) schools and their characteristics, (3) achievement gap, and (4) relation of achievement to school characteristics. Specifically, the Coleman Report examined the school environment as measured by school curriculum and programs and by resources, including facilities, principals and teachers, and student bodies. The Coleman Report concluded that U.S. public education at that time was largely unequal in most regions of the country, particularly in regions where there were significant numbers of African Americans.

Focused on six racial and ethnic groups of U.S. public school students, the Coleman Report found that U.S. public schools in the late 1960s were largely segregated. White students were the most segregated, with 80% of first and 12th graders attending schools that were 90% to 100% White.

Among minority groups, African American students were the most segregated, with more than 65% of first graders attending schools that were between 90% and 100% African American. Such segregation ran parallel to the inequities found in school resources and curricula, which were closely related to academic achievement.

Coleman and colleagues found that minority students had less access to physical and human resources that supported curriculum and instructional programs (e.g., physics, chemistry, and language labs). These students also had less access to a more fully developed curricular program (e.g., college preparatory curriculums, accelerated curricula, vocational curriculums, intelligence testing). For example, minority students attended schools with a larger teacher–student ratio than did White students minorities. Compared to White students, African American students, on average, attended a school with a greater percentage of teachers who had attended college fewer years, had less teaching experience, and had lower salaries. In addition, minority students had fewer books in their libraries and fewer textbooks.

Following the administration of achievement tests in reading, writing, calculating, and problem solving at Grades 1, 3, 6, 9, and 12, the Coleman Report indicated that the test results showed that most minority students, and particularly African American students, at Grades 1 to 12 scored lower than White students in verbal and nonverbal skills, with a widening gap as the grade levels increased. The researchers concluded that school factors and nonschool factors (e.g., poverty, community attitudes, and low educational level of parents) may disadvantage minority students. Also, the investigation of student body characteristics revealed African American students most frequently came from a large family with less education. In particular, the EEOC found that African American students were more affected by the quality of their schools and curriculum than were their White peers. Ultimately, Coleman and colleagues suggested that in order to narrow the achievement gap between minority and majority groups, it was imperative to increase the integration of schools, which would enhance the quality of the curriculum and the improvement of schools.

The Coleman Report made a significant contribution to equality of educational opportunities as

evidenced by the desegregation in the policies and practices of curricula and the narrowing of the achievement gap among racial and ethnic groups over the past four decades. Despite this, substantial variations in student achievement still exist due to the policies and practices of curriculum inequality. Thus, to achieve the true equality of educational opportunities that allow all students to enjoy equal access to all programs and benefits provided by the public education, it is imperative to develop an equitable and gender balanced multicultural curriculum that eliminates segregation, appreciates diversity, and incorporates the perspectives, experiences, and achievements of men and women of diverse racial, cultural, and socioeconomic backgrounds, ethnicities, and national origins.

---

## EQUITY

---

Equity, in general terms, means the quality of fairness or impartiality. Equity, related to education and curriculum, does not connote that every student should be treated in the same way; rather, it indicates that each student should be guaranteed fair treatment with equal access to resources and curricular programs. To ensure educational curricular equity for all students, the U.S. government has enacted numerous laws, such as The Civil Rights Act of 1964 (e.g., Titles VI and VII), The Education Amendments of 1972 (e.g., Title IX), and Individuals with Disabilities Education Act of

1997. Through these laws, an unprecedented commitment has been made to educate all students, regardless of such challenges as their language, physical abilities, backgrounds, characteristics, and/or gender, to be effective thinkers, problem solvers, and communicators so that they can participate successfully in a globalized technology-driven world.

Despite laws aimed at guaranteeing equity for all, securing educational curricular equity in reality becomes the responsibility of the professionals in the education field, including school boards, superintendents, principals, teachers, and staff, as well as community members. First, school districts and schools should design an equity plan to ensure that curricula are established to maintain an inclusive educational program, that responds to the needs of all students through understanding that student learning is influenced by a myriad of factors such as students' gender, culture, language, socioeconomic level, talents, exposure, and family values. Second, school policies and procedures should address curricular equity guaranteeing that all types of students are included and represented in the curriculum. Third, all stakeholders must be willing (a) to discuss openly and sensitively the diversity of students, speaking with inclusive language and (b) to incorporate such diversity discussions in the curriculum. Fourth, high expectations of achievement should be held for all students regardless of ethnicity, gender, ability, or socioeconomic level. Fifth, physical and human resources that supported curriculum and instructional programs should be accessed equally. Curriculum materials and visual media accompanying them should (a) portray gender, races, ethnicities, ages, religions, and abilities in multiple roles and responsibilities and (b) demonstrate the various groups' contributions fairly. Sixth, school policies, including curriculum policies, should promote and demand respectful behaviors. Such policies aid in establishing a learning environment with language and actions without prejudice. Seventh, equity also should include the capacity for all students and teachers to feel they are participating in a safe environment; thus, safety curriculum should be supported financially and should be established inclusive of peer mediation. Eighth, professional development should focus on establishing an agenda of inclusiveness and equity in schools and

on advancing the values, attitudes, knowledge, and skills that promote understanding and respect for students' ethnic, cultural, and economic backgrounds. Such professional development improves the way that educators relate to and interact with students of diverse backgrounds and helps them in developing a fair and socially just learning environment. Ninth, a flexible and inclusive curriculum requires success-oriented approaches to assessment and evaluation that are related to the aims of the curriculum, the design and delivery of the curriculum, and the ethnic and cultural backgrounds of students. Tenth, curriculum aligned with state or national standards may promote educational equity in that the equivalent standards are expected of all, not just some students in some schools. Standards-based education reform, though surrounded by controversy, emphasizes clear expectations for all students and seeks to establish attainable and measurable principles for the entire student population.

Many students today continue to have inequitable opportunities and do not experience quality learning due to curriculum inequity. Constructing curriculum for equity is a consistent and dynamic process requiring not only awareness of the contextual realities of students with different linguistic, ethnic, racial, cultural, and gender backgrounds, but also commitment to diversity, pluralism, multiculturalism, respect, dignity, and high expectations. More importantly, constructing a curriculum of equity necessitates (a) the courage to address and dismantle systems of oppression and (b) a revolutionary resolve to remove the barriers to the achievement of a truly just distribution of power and opportunity.

## ETHICAL CULTURE SCHOOLS

---

The Ethical Culture School is a historical curriculum model based on the work of its seminal influence, Felix Adler, and is an organic alternative for education in the United States as a Sunday school program of study, a private school option at Fieldston Ethical Culture School in New York, and as a charter school option in New Jersey.

Adler, graduate of Columbia College with a doctorate from the University of Heidelberg, merged Kantian idealism with elements of U.S. Transcendentalism to develop a theophilosophic statement that he promoted by founding the Society for Ethical Culture in 1876. Adler contended the differences that demarcate major religious traditions are not as significant as the common ethical foundation. Adler urged companions to attend to urban social problems such as tenement housing and child labor as active response to the moral imperatives to recognize the inherent dignity of all people, mutual support, and social responsibility.

In *The Moral Instruction of Children*, Adler suggested a common fund of moral truth serves to unite and direct schools in the United States, and the effective teacher transmits this cultural ethic through moral training in a climate of intellectual exploration. Adler presented a model of educational reform based on the cultural epoch theory whereby the child grows into adulthood by replicating the past stages of Western civilization. Adler relied on habit formation and integration of moral lessons in the school environment, but also called for the exercise of moral reasoning. Adler divided human development into distinct stages, each with a predominant duty that moral instruction challenges to provoke maturity. In infancy, obedience to parents forms the central duty to be fashioned in the child. In early childhood, forming right habits is of primary importance. With regard to all

dimensions of social living, from ages 6 to 14, duty shifts to acquiring knowledge of physical life, family, filial and fraternal obligations, and emotional control. The young child learns regularity, obedience, and a sense of self-responsibility, having parents or instructors impose their will on the activities of the child. Curriculum at this age consisted of moralistic fairy tales, fables, and bible stories. The final subject for study in early childhood is the *Iliad* and the *Odyssey*, consistent with the cultural epoch influence.

The uncomplicated reinforcement of moral conduct through story in childhood is replaced in adolescence with an exploration of moral principles. These lessons on duty follow an inductive method, stating a theorem and then adapting the theorem to incorporate exceptions. Children learn general principles of conduct by reflecting on their origins in human experience. Moral reasoning required direct moral instruction, but the standard curriculum of secondary education, Adler argued, also carries moral lessons. Science teaches truthfulness; history is the study of exemplars of moral conduct as well as being an investigation of the outcomes of immoral behavior. Literature, music, gymnastics, and even manual training teach standards of excellence. The greatest lesson, Adler reminds, is the example set by the instructor in his or her conduct.

Adler's sequenced approach to moral education through example, story, moral problem solving, and application formed the basis of the Sunday schools conducted at Ethical Culture Societies in New York and other major urban areas in the United States. The establishment of schools to advance ethical action in the society was a priority for Adler, with a free kindergarten and a Workingman's School established by 1880. The elements of moral education and personal development were joined with an emphasis on manual training, a humanist arts-focused curriculum, and teacher training. Consistent with the tenets of ethical culture, the school continued to evolve, accepting tuition paying students and was reorganized in 1895 as the Ethical Culture Schools. In response to the student population, Ethical Culture Schools adopted a liberal arts curriculum incorporating progressive instruction while retaining Adler's emphasis on moral reasoning. On the 50th anniversary of its founding, the Ethical Culture

Schools moved to a larger campus in the Bronx with the Fieldston Building intended as an architectural realization of ethical culture education. The Fieldston School participated in the Eight Year Study and served as a research site and headquarters for the Commission on Secondary School Curriculum's Adolescent Study. This school continues to emphasize the principles of service, ethics, and academic rigor, but as a high-tuition private school.

In 2008, the state of New Jersey authorized charter school status for the Ethical Community Charter Schools, a group of schools that emulate elements of the ethical culture development model of moral development and reasoning, service, and intellectual inquiry. The impetus for this charter school is from members of the New York Society for Ethical Culture.

## ETHNICITY RESEARCH

---

Ethnicity denotes membership in a particular racial, national, or cultural group and observance of that group's customs, beliefs, and language. One of the earliest considerations of the educational development of ethnic minorities in the United States came in the form of the common school movement, which primarily proposed a curriculum intended to encourage a common sense of citizenship and patriotism among U.S. various ethnic groups. However, there were some ethnic groups, such as those of Native American, African American, Latino/a American, and Asian

American descent, who were either excluded or marginalized by the common school movement. Within mainstream curriculum conversations, these groups were often thought to be either biologically inferior or culturally deprived; thus the educational development of these groups was aligned with curricula that sought to Christianize, civilize, and/or prepare them for vocations that would maintain their subservience to the dominant group. Although these ideas were prevalent and guided much of the state and or federally supported education of these groups, they did not go uncontested. Members of subordinated ethnic groups challenged these types of curricula with commentaries and studies that stressed the importance of cultural history and values in the education of minority children. Carter G. Woodson's *Miseducation of the Negro*, for instance, is a classic example of early ethnicity research that critiqued the viability of the mainstream curriculum for African Americans and in so doing laid an important foundation for future ethnicity research and its importance in interrogating, complicating, and broadening mainstream curriculum discourse. However, the exclusion of these ethnic groups from mainstream curriculum conversations and thus often from curriculum history would remain the case until the late 1960s when African Americans and other ethnic minorities began to call for more representation in U.S. school curricula from elementary school to college.

In the 1960s, there were two key developments that ushered the concerns of ethnic minorities into the field of curriculum studies. First, the curriculum field, which had been focused on issues of development and implementation, began to expand its scope to include a more interdisciplinary perspective that sought to broaden the meaning of curriculum and to study its social, political, and cultural dynamics within the context of school and society. Second, following the U.S. Supreme Court's *Brown v. Board of Education* (1954) decision, African Americans began to push for more representation in elementary, secondary, and college curricula. Initially their protests gave rise to Black studies programs in many colleges and universities and later as more ethnic groups—Native, Latino/a, and Asian Pacific Americans followed suit, ethnic studies programs became the basis of one of the most significant movements in U.S. education.

Many of the scholars who studied in or were influenced by these programs became key proponents of the multicultural education movement. By the 1970s, multicultural education had gained significant recognition as an important prospect in improving the academic achievement of minority children as well as raising the awareness of the majority population about the cultural history and values of various ethnic groups. Although it began as a call for more minority representation in the curriculum, the multicultural education movement developed into a more complex approach aimed at reforming teaching materials, teaching and learning styles, teacher perceptions and behavior, and school culture. Multicultural education has served as the foundation and/or impetus for much of the ethnicity research that has taken place in the field of curriculum studies.

Since the 1970s, ethnicity research has greatly impacted curriculum studies as it has challenged the idea that curriculum is a culturally and racially neutral process or product and has shown it to be at times a powerful tool of cultural repression and forced assimilation. Although each of the aforementioned ethnic groups has a distinct and complex history of educational development, there are several fundamental ideas that have grown out of research on their histories, experiences, and ongoing challenges. One of the most important is the idea that one's cultural being—histories, values, and behaviors—plays a crucial role in one's educational well-being. What ethnicity research has shown, however, is that the cultural reality upon which the curriculum in U.S. schools is built is a Northern European one to the near exclusion of all others. As such, the research often refers to the phenomena of cultural discontinuity or the cultural disconnect between school and home and between teacher and student. Cultural discontinuity in many cases is exacerbated by cultural resistance, the student's resistance to learning a curriculum that has essentially devalued his or her cultural being. An overall goal, then, of much of this research is to theorize ways to achieve cultural congruence.

One strategy for achieving cultural congruence, as mentioned earlier, involves pushing for more culturally diverse representations in the mainstream curriculum. These would include, for instance, more images of ethnic minorities and

more accurate representations of their histories and/or perspectives in school texts. Another strategy would be educating the largely White middle-class and female teaching force to be more attuned to and thus understanding of diverse cultural worldviews and the ways in which they impact learning and teaching styles. Research in this area has brought to the forefront the concepts of culturally responsive teaching and culturally relevant pedagogy. Bicultural and bilingual education have also been key strategies as they stress the importance of developing curriculum that is based on values, behaviors, and languages from both the home and school cultures. Ethnocentric education has also been explored as a way to achieve cultural congruence and improved academic achievement among ethnically diverse students. Although this strategy is controversial in that it requires racially and/or culturally separate schools, such as African-centered or Puerto Rican-centered schools, it offers the most aggressive challenge to the dominance of European-centered curriculum, for it acknowledges the reality that racially and culturally distinct groups often possess epistemologies that are not only different from the scientific rationality that grounds mainstream curriculum, but have been historically devalued by it.

Although the majority of ethnicity research is focused on improving the educational well-being of ethnically diverse student populations, there is also a growing body of work that is thinking through how children of dominant groups are disadvantaged by the lack of culturally diverse representation in the curriculum.

## ETHNOGRAPHIC RESEARCH

---

During the final quarter of the 20th century, ethnographic research methods became widely accepted in a number of fields, including the field of curriculum studies. In curriculum studies, for instance, acceptance of ethnographic methods permitted researchers to study the so-called hidden curriculum phenomenon empirically and conceptually. Ethnographic methods also served as a foundation for a range of other qualitative research strategies that segments of the curriculum studies field enthusiastically embraced. One example would be curriculum theorist Elliot Eisner's educational criticism approach to inquiry. To be sure, Eisner based his educational criticism approach to inquiry on criticism in the arts, but at least in the early years, educational critics often borrowed and adapted their empirical research strategies from ethnographic research.

Historically, the term ethnographic research referred to the sort of field-based inquiry practiced by social anthropologists in England and cultural anthropologists in the United States. Social and cultural anthropologists immersed themselves for extended periods of time in the lives and folkways of isolated, so-called tribal cultures to understand either their social structures or their very different ways of thinking and acting. Over time, the distinction between the social and cultural schools of anthropology began to blur, and most anthropologists today employ what might be best characterized as a sociocultural perspective. Today, and in the past, however, both the field studies that sociocultural anthropologists do (and have done) and the research reports they produce (and have produced in the past) are labeled *ethnographies*; the anthropologists themselves were—and are—called *ethnographers*.

Today, of course, there are few isolated tribal cultures left in the world for anthropologists to study. Consequently, contemporary sociocultural anthropologists often study subgroups within their own cultures. They might study a “tribe” of physicists, for example, or do an ethnography of an accounting firm in the wake of an ethical crisis in that profession. Anthropologists, of course, also study contemporary schools as vehicles for cultural transmission.

One other difference between the present and the past is that today fields other than anthropology have begun appropriating both the ethnographic research label and the ethnographic methods that sociocultural anthropologists developed to do their field work. As has already been noted, one of these fields is curriculum studies. Like other educational researchers in the final quarter of the 20th century, many curriculum scholars became dissatisfied with the quantitative research methods that the educational research community had been using throughout the previous three quarters of the century. These researchers found a ready-made storehouse of alternative methods—and a well-articulated rationale for using them—in the sociocultural anthropologist's ethnographic research. Some educational researchers within and outside of the subfield of curriculum studies even began to use the term ethnographic research as a synonym for qualitative research.

The remainder of this entry focuses on three general topics: ethnographic research methods in sociocultural anthropology, the subfield of educational anthropology, and the curriculum studies field's interest in and appropriation of ethnographic research techniques.

### Ethnographic Research Methods in Sociocultural Anthropology

#### *Participant Observation*

When anthropologist Bronislaw Malinowski traveled to Melanesia in the early part of the 20th century to study groups of people who were radically different from the people in his own culture, it made no sense for him to try to employ the sorts of research designs being used by social scientists back home. It made no sense, for example, to divide the natives into control and experimental

groups and conduct experiments; even survey research designs were inappropriate for a culture with no written language. Furthermore, even when Malinowski began to master the local language, he was still not positioned to administer preset survey items orally because there was no guarantee that his interviewees—who thought and acted very differently than Malinowski did—would interpret the interview questions the way Malinowski intended or that Malinowski could correctly interpret the natives' responses.

To cope with this unusual situation, Malinowski, through a process that was often more serendipitous than planned, developed a set of research procedures that came to be known as participant observation. Basically, participant observation entails becoming actively engaged in the life of the cultural group one is studying. (The phrase *going native* is sometimes used to characterize this engagement process.) It also entails simultaneously standing back, observing, systematically recording, and analyzing the cultural life one is experiencing. The duality implicit in the research strategy of participant observation is possibly best captured in the title of anthropologist's Hortense Powdermaker's classic book, *Stranger and Friend: The Way of an Anthropologist*.

### *Underlying Assumptions About the Form and Function of Research*

Clearly, the research strategy that Malinowski developed—and that most ethnographers, in one way or another, still use—is quite different than the research strategies used by most other social scientists in the 20th century. Furthermore, the differences are more than procedural. Implicit in the participant observation strategy are assumptions about the form and function of research that also differ radically from the assumptions made by most of the social sciences.

One rather obvious difference is the participant observer's view of subjectivity. Although most social scientists viewed (and continue to view) subjectivity in the research process as a problem—and employ a variety of instrumentation and standardization procedures to ensure that the researcher's subjectivity is kept at bay during research activities—ethnographers view a researcher's subjective responses as essential for learning about

what, from the ethnographer's perspective, is an alien universe.

To be sure, a researcher must carefully manage his or her subjectivity; going completely native is highly problematic even in ethnographic research, in other words. But when appropriately leavened with critical reflection and the systematic recording of one's direct observations and personal feelings for later analysis, a researcher's subjective experiences serve as entry into worlds that could never be accessed or understood without the researcher's active engagement. Indeed, a failure to engage would mean that the ethnographer would end up imposing his or her own meanings onto a cultural group rather than accessing the group members' thinking and interpretations.

The notion of participant observation also normally carries with it a different view of the purpose of research. Although traditional researchers normally have as their ultimate goal the construction of general theory that transcends particular contexts and situations, the goal of most types of ethnography in sociocultural anthropology is to explicate the idiosyncratic elements of particular cultural groups.

Anthropologist Clifford Geertz borrowed philosopher Gilbert Ryle's concept of thick description to characterize what most ethnographers hope to produce. Geertz noted that any behavior can have multiple meanings attached to it; the goal of the ethnographer, Geertz wrote, is to explicate the layers of meaning found within a particular cultural context. What ethnographers provide, in other words, are interpretations of the interpretations made by those who are part of the cultural group the ethnographers has studied.

To be sure, some anthropologists do engage in something called ethnology—that is, a practice that entails building general cultural theory from ethnographies of individual cultures—but that practice became less popular in the 20th century because it too often glossed over cultural differences in its attempt to find—or critics would argue, manufacture—cross-cultural generalizations. Geertz, in fact, argued that most cultural theory stripped of the details that produced it is either vacuous or little more than common sense.

Geertz, however, did not totally reject traditional social scientists' notion of theory. Rather, he turned the notion on its head. He suggested that

theoretical constructs were, indeed, required to interpret situations. Ethnographers could not describe—or even recognize—culture, for example, if they did not have the theoretical construct of culture at their disposal. The key idea, here, however, is that Geertz and his fellow anthropologists transformed theory into a tool for doing research rather than the endpoint of the research process that more traditional social scientists envisioned.

### *Variations in Ethnographic Research Within Sociocultural Anthropology*

Even within sociocultural anthropology, ethnographic research is not a completely unproblematic construct. Although most contemporary anthropologists have transcended the traditional divide between social and cultural anthropology, sociocultural anthropologists continue to disagree about many things.

Certain anthropologists, for example, have challenged Geertz's self-described semiotic view of culture and suggested substituting a cognitive view, instead. Rather than creating thick description, cognitive anthropologists such as Ward Goodenough and James Spradley use a series of interview and analysis techniques they call *ethnographic semantics* to discover the definitions of specialized terms members of a cultural group use and the linguistic relationships between these terms.

Cognitive anthropologists, for instance, have used ethnographic semantic techniques to discover everything from the many ways that Eskimos categorize ice to the multiple categories that cocktail waitresses use to refer to and treat their customers. The assumption is that language mirrors thought and that by explicating the shared language and linguistic structures a cultural group uses to think and act intelligently in their cultural context, one will understand the culture. As might be expected, Geertz has argued that this cognitive perspective represents an inadequate and indeed, an impoverished view of culture.

Another contemporary controversy has been fueled by charges that the cultures that anthropologists study and from which they generate thick descriptions of today are no longer remote and untouched by the rest of civilization. Ethnographers, however, have continued to focus on face-to-face cultural interactions and/or contextual idiosyncrasy;

as a consequence, they completely ignore global forces. Anthropologists who critique their field in this way often recommend re-embracing a strategy that was once largely rejected by the field: Analyze ethnographies from multiple sites much as earlier ethnologists interested in developing more general cultural theory did. These critics, in short, recommend that the anthropology field once again actively attempt to transcend the local and the idiosyncratic, albeit for a somewhat different reason than the reasons that motivated ethnologists in the past.

One final variation is worth noting: A cadre of early 20th-century anthropologists anticipated the arts-based research movement in educational research by nearly a century. In 1890, for instance, anthropologist Adolph Bandelier published his novel *The Delight Makers*, which was a fictional account of the data Bandelier had gathered while studying a group of American Indians. Bandelier reasoned that fiction was the best way to communicate to the general public the truths he had discovered about a radically different cultural group. Even today, a small cadre of anthropologists continues to use art and literary modes of communication to display the results of their work.

### **The Subfield of Educational Anthropology**

#### *The Study of Cultural Transmission in Tribal and Western Cultures*

Because ethnographers have always studied cultural socialization and the phenomenon of cultural transmission, they have always, in a very real sense, studied education. Tribal cultures' formal initiation processes, for example, can legitimately be seen as analogs for schools in contemporary Western culture, even though ethnographies of these tribal "schools" reveal that the sacred cultural beliefs transmitted in them are radically different from the career-oriented formal curricula taught in most Western schools.

These apparent differences caused some anthropologists to take a closer look at Western education. This closer look resulted in a rethinking of schools and schooling in Western society, a rethinking that portrayed schooling as an extended initiation rite through which students of different races, classes, and genders were socialized into the roles their culture expected them to play. During the

1960s and 1970s, in fact, works such as Ray Rist's *The Urban School: A Factory for Failure* helped generate and empirically ground numerous discussions in the curriculum field and elsewhere about the so-called hidden curriculum of schools.

### *The Emergence of a Formal Field of Study*

Not surprisingly, the sort of studies of schools and schooling alluded to above resulted in the creation of an identifiable academic field of study called *educational anthropology*. The field has its own journal—appropriately named *The Journal of Educational Anthropology*—as well as a founding hero, Stanford University anthropologist George Spindler. One of Spindler's students, Harry Wolcott, produced an early educational ethnography, *The Man in the Principal's Office*, that received considerable attention within the educational research community and served as a model for other would-be educational anthropologists to emulate.

### *Educational Ethnography Variations*

Just as in the larger field of sociocultural anthropology, the subfield of educational anthropology has exhibited considerable variation over the years. Different groups of researchers, in fact, have embraced both micro and macro versions of ethnographic research.

Microethnographers such as Fred Erickson and Ray McDermott, for instance, have used videotape to minutely analyze the interaction patterns of such things as counseling sessions and elementary school reading groups. More often than not these microethnographers quite literally counted behaviors. This counting helped give their work status in the educational research world that has traditionally valued quantification.

Other educational researchers such as Gary Anderson were inspired by critical theory to move to the more macro end of the micro–macro continuum. This group practiced what they called *critical ethnography*. The rationale for critical ethnography is reminiscent of the rationale for multi-site ethnography described above: Educational ethnographers should study not only the culture that is created through face-to-face interaction within a school, school district, or other educational setting, but also the impact of larger societal

forces that shape and constrain the interpersonal interactions—and consequently the culture that gets created—in those settings.

### **The Curriculum Studies Field's Interest in and Appropriation of Ethnographic Techniques**

During the final quarter of the 20th century, all sorts of educational researchers, including researchers from curriculum studies, became interested in ethnographic research. For the most part, this interest was fueled by frustration with the results—or more precisely, the lack of results—produced by quantitative studies.

This frustration, initially, was felt most strongly by those who evaluated the effects of educational curricula and programs. These scholars began to realize that the traditional experimental designs they had been trained to use did not fit comfortably onto the often complex programs they were charged with evaluating. Some evaluators, for instance, pointed to significant unanticipated consequences of certain educational interventions, consequences that were ignored by experimental studies that, by design, focused only on formally articulated a priori goals. Others pointed out that those who conducted large-scale evaluation studies ignored even clearly articulated goals that were difficult (if not impossible) to measure in traditionally accepted ways.

These problems led some evaluators to radically rethink what evaluation research should look like. Many looked to the discipline of anthropology and that discipline's ethnographic research techniques for methodological alternatives to the quantitative methods they had been trained to use.

Program evaluators' interest in ethnographic methods soon expanded to the entire educational research community, and ethnographers' research techniques and constructs—for example, participant observation, the researcher-as-instrument, thick description—soon became part of the vocabulary and the methodological repertoire of many educational researchers, including researchers in the field of curriculum studies.

Educational researchers' appropriation of ethnographic techniques and thinking has been so extensive, in fact, that today many educational researchers now use the terms qualitative research and *ethnographic research* more or less interchangeably.

From a historical perspective, however, this conflation of terms is more than a little problematic.

Problems arise because ethnographic research traditionally has had a substantive focus on culture as well as a methodological commitment to using participant observation-oriented research designs. Consequently, although curriculum studies scholars' empirical explorations of the hidden curriculum phenomenon might legitimately be viewed as a form of ethnographic research—because the hidden curriculum functions as a form of cultural socialization—many other qualitative studies in the education field, including studies in the subfield of curriculum studies, are not ethnographies in the traditional sense. Therefore, for most of the qualitative studies conducted in the field of curriculum studies and in education, generally, it might be best to think of ethnographic research as being subsumed under—rather than as a synonym for—the more generic category of qualitative inquiry.

## EUGENICS

---

Eugenics (from the Greek roots for good and generation or origin) was an international scientific, political, and moral ideology and movement that reached its height in the first half of the 20th century. Advocates of eugenics touted its potential to improve the quality of the human race through the promotion of higher reproduction of certain people and traits and through the reduction of reproduction of certain people and traits. Following the end of World War II and the recognition of the genocidal enactment of this ideology, it was largely regarded as a brutal movement that inflicted massive human rights violations on millions of people and was substantially abandoned by the mainstream and academia. However, the legacy of eugenics continues to be felt in both policy and practice, as ideologies of race-based characteristics and aptitudes manifest themselves in current regimes of testing, standards, curriculum differentiation, tracking, and segregation of students. There is continuing evidence of eugenics' policies in teacher education, curriculum development, and school organization.

Eugenics was presented as a way that human breeding could be controlled to improve the species. From the beginning, however, there were subtle and overt rhetorics that proved extremely dangerous. In the early part of the 20th century, Americans were increasingly fearful of foreigners and immigration, and local eugenics' societies and groups sprang up around the United States after World War I, with names such as the Race Betterment Foundation. Not only did eugenicists promote better breeding, but also they wanted to prevent poor breeding or the risk of it. In 1924, the Immigration Act was passed by majorities in the U.S. House and Senate. It set up strict quotas limiting immigrants from countries believed by eugenicists to have inferior stock, particularly Southern Europe and Asia.

The most infamous proponent and practitioner of eugenics was Adolf Hitler, who incorporated U.S.-developed ideas and strategies for race betterment into *Mein Kampf* and emulated eugenic legislation for the sterilization of defectives that had been pioneered in the United States. Hitler was proud of his connection with U.S. eugenicists and drew extensively from their writing and research.

Perhaps the most well-known modern eugenicist was William Shockley who, late in his life, became intensely interested in questions of race, intelligence, and eugenics. Shockley believed that the higher rate of reproduction among the less intelligent would lead to a drop in average intelligence and ultimately to a decline in civilization. He proposed that individuals with IQs below 100 be paid to undergo voluntary sterilization.

Shockley created great consternation among other eugenicists, some of whom thought he gave their work a bad name because of his overt racial agenda. Others praised him for breaking the taboo of frank discussions about racial differences.

Unfortunately, the legacy of eugenics is still alive and thriving in our educational system. Not only was Lewis Terman, one of the originators of the Stanford-Binet intelligence test, an early proponent of tracking, but his views were rooted in a eugenic conception of intelligence. He maintained that school instruction could never educate male laborers and female servants to become truly thoughtful, intelligent voters, and intelligence tests have proven this to be true.

Alan Stoskopf has pointed out that the idea that educational standards could be measured through single-numbered scores is a concept deeply embedded in the current high-stakes testing movement and the policies of No Child Left Behind and has resulted in devastating effects on students of color and those from economically disadvantaged backgrounds.

The ways in which students are still sorted into educational programs on the basis of IQ tests with their curricular options curtailed by their putative potential and aptitudes remains a serious manifestation of a eugenics' orientation. The overrepresentation of students of color and poor students in special education program and the corresponding overrepresentation of upper middle-class White students in gifted programs is evidence of the enactment of (often unstated) concepts of eugenics.

Students from particular racial and ethnic groups are deemed capable of only lower-level curriculum and direct instruction, while more advanced curriculum and creative, interactive pedagogical strategies are reserved for those deemed more capable.

## EUROPEAN CURRICULUM STUDIES, CONTINENTAL OVERVIEW

---

Curriculum studies as a field of education may today be found in continental Europe (including the Nordic countries) in most universities, teacher education institutions, and institutions of further training. This tendency represents in certain ways a late 20th-century development. It was in 17th century Europe that the concepts of curriculum and didactics were first used to denote educational phenomena. Didactics was linked to Wolfgang Ratke's (1571–1635) *Methodus didactica* and to Johann Amos Comenius's (1592–1670) *Didactica magna*. The use of the term *curriculum* may be linked to Daniel Georgius Morhof (1639–1691), professor in Rostock from 1660. From this century on, traditions developed in which the expression didactics became the usual one on the continent, while the term curriculum was the one adhered to in the English-speaking Western world. One may say that there exist two main traditions: the Anglo-American tradition of curriculum studies and the Continental and Northern European tradition of didactics. The curriculum studies tradition has, however, to a certain degree been acknowledged, adopted, and adapted also in European continental educational contexts, as indicated, without, however, these curriculum studies losing their lasting

influence from the didactic tradition. This fact makes for the relevance of the present topic.

The word curriculum is not a common word in any of the continental countries and is used only in special contexts such as curriculum vitae. An exact translation of it in any of the European continental languages does not exist. The word usually used to transfer the meaning of curriculum is *læreplan*, *läroplan* (Norwegian, Danish, Swedish), *Lehrplan* (German)—translated into English meaning curriculum guidelines. The concept *læreplan* has, however, acquired a manifold meaning implying complex relations in compliance with the concept of curriculum. Another way to put it is to say that curriculum and curriculum studies as well broadly covers the why, what, and how of education and schooling. The why refers to the aims and goals related both to superior goals and to the aims of school subjects, the what to the content in general and to specific schools and school subjects, while the how refers to teaching methods related to classroom practice. This implies compared to English-U.S. curriculum studies a marked difference underlying the didactic inheritance stressing *Bildung* and the importance of educating for life and the whole person more than educating for certain standards that can be measured individually.

In continental Europe curriculum studies have, from the 1960s and 1970s, preferred to focus on the subjects that make up the curriculum or teaching content. This growing interest arises from a number of different causes. The societal importance of frequent efforts to reform the curriculum through plans for reconstruction has highlighted the centrality of school subjects. Moreover, a renewed emphasis on content in terms of defining basic skills or a core curriculum naturally focuses on school subjects. The introduction of school subject didactics in teacher education courses and as part of academic degree courses during the 1980s has also contributed to this trend. A professor of school subject didactics will be found in most universities in the Nordic countries and especially in Germany.

In the present entry on curriculum studies the main focus is on traditions in continental European curriculum studies and on recent trends. When traditions are concerned, especially two kinds of curriculum studies may be discerned: historical studies on the educational system, including the

school subjects, and on the history of educational and philosophical ideas. Concerning recent trends, a marked characteristic of contemporary work is a tendency to view curriculum issues as embedded in complex philosophical, sociological, political, and cultural problems. This may cause difficulties when attempting to classify the underlying incentive of specific curriculum studies. At the same time complex issues related to, among other things, comparative evaluations of student standards such as the Project on Student Assessment Study (PISA) and Trends in International Mathematics and Science Study (TIMSS) as well as European Union initiated cross country research and research networks give rise to a great variety of curriculum studies. Curriculum studies of the subject matter are, however, very central to both traditional and contemporary curriculum studies. Some examples of different studies from both periods are included in this entry.

### Traditions in European Curriculum Studies

A variety of research approaches may be discerned, and it is also the case that different research traditions still live side by side.

The first of these traditions is dominated by historical, descriptive curriculum research, following a well-established historical approach. Historical research studies on the curriculum can be related on the one hand to the history of educational movements and ideas and on the other, to the history of educational systems and institutions and of educational legislation. Historical studies of the educational system provide important data and knowledge about curriculum reforms. The aim of these studies is to describe historical events rather than to develop theory. The history of educational and philosophical ideas related to the content of school subjects is another approach. A classic and very influential study of the history of ideas in the Scandinavian context is Håkan Andersson's work on the aims of history teaching in Finland, 1843 to 1917. He places the history of school subjects in a wide societal, educational, and philosophical-ideological context, anticipating the kind of school subject research that was later to be developed by people such as Ivor Goodson.

The second tradition is curriculum research as curriculum development, following, to some

extent, a scientific approach. The third one is curriculum research according to macrosociology, using a critical perspective related to structuralism. The influence of the sociology of education and the sociology of knowledge has brought about a shift from more traditional types of curriculum studies—that is, from atheoretical attempts to chronicle the development of a school subject—to a different way of looking at the nature of education and consequently, a new approach to analyzing the antecedents of curriculum change. Tomas Englund argues that research in Nordic curriculum history forms part of an international universe, historically related to the new sociology of education and critical curriculum theory, and that this tradition may be seen, in certain ways, as a critical correction to the optimistic, rational-scientific conception of curriculum, and to studies of curriculum history based upon it. Three stages or trends of influence may be discerned.

The first is linked to the new sociology of education, where the focus of influence exerted seems to be the nature of school knowledge as related to the social class of students.

A second and overlapping influence comes from French educational sociologists such as Pierre Bourdieu and Jean-Claude Passeron. Instrumental in bringing about this influence was especially Staf Callewaert, a Belgian Marxist who came to live in Sweden and Denmark, holding for some years the chair in education at the University of Copenhagen. Through this influence a move toward reproduction theory became noticeable, focusing on the function of school subjects and school knowledge in terms of both social and cultural reproduction.

The concept and phenomenon of curriculum codes—underlying curriculum principles—specifically coined and developed by Ulf P. Lundgren and his associates within the Research Group for Curriculum and Reproduction at the Stockholm Institute of Education, has also become important. It is seen as inherent in the development of school subjects, and is consequently acknowledged in many studies related to the social history of school subjects, and may be looked upon as a special Scandinavian contribution inspired by the new sociology of education, as well as by reproduction theorists.

The fourth one is curriculum research based on curriculum theory and curriculum history theory.

Following the curriculum history research done in the United Kingdom, the Swedish reproduction and curriculum code research, and the research done on school subjects at the German Institute for Science Education, we may talk about the generation of a fund of theory directly related to curriculum history as a scientific and academic discipline. To give an example, according to Stefan Hopmann and Henning Haft some determining factors to be taken into consideration when trying to understand historically the introduction of new school subjects may be the following:

- The scientific, cultural, and perhaps economic limits and merits of a school subject.
- The definition and transformation of those features into curricular concepts by experts, teachers, associations, and interest groups.
- The pattern and stability of the overall framework, as well as of the different interests inside and outside schools that are associated with their particular operational characteristics.
- The reactions and interventions of parents, teachers, and students, on the one hand, and of the society's or the economy's various purchasers of knowledge on the other.
- The political, administrative, and educational resources available for the new subject's implementation.

### Recent Trends

Currently, there seem to be a strong desire to examine the curriculum field from the point of view of both empirical and theoretical interests, embracing a wide range of contexts and of theoretical and methodological perspectives. Indeed, one specific study may encompass several theoretical and methodological viewpoints and deal with more than one context. This may be understood in terms of an awareness of the complexities of curriculum issues in postmodern society. A further marked characteristic of contemporary work is a tendency to view curriculum issues as embedded in complex philosophical, sociological, and cultural problems. This may cause difficulties when attempting to classify specific curriculum studies. A clear-cut description seems, therefore, not possible or desirable. Some compelling issues may, however, be focused leaving room for

describing underlying theoretical and methodological frames of reference.

### *Research on Curriculum Reform*

The 1990s in most European countries saw an upsurge of curriculum reform proposals and implementations beyond anything previously experienced. It is possible to describe the overall intention of the educational innovations that have been put in place as systemic; indeed, they represent an attempt at major systemic reform, though what is meant by systemic reform may differ from country to country—for instance teacher initiated, standards driven, or curriculum driven systemic reform. It makes sense to characterize systemic reform as a reform that is the following:

- Part of a wider reform of the educational and social system.
- Part of a comprehensive reform aimed at all levels of education.
- Reform positing coherence among school types within the school system.
- Reform striving for goal coherence—that is, based upon national overarching goals that are translated into goals for all school subjects, and into curriculum programs at all levels.
- Reform that is implemented through the incorporation into planning strategies of all relevant factors and constraints, including teacher education and assessment.

### *Research on the Process of Curriculum Making*

Naturally, the field of curriculum studies has focused on curriculum reform as a much preferred object of research and source of material for theory construction. One study that makes an issue of the process of curriculum-making as well as implementation and enactment, is the international comparative project “From Curriculum Development to Syllabus Planning.” Findings from Germany, Switzerland, Norway, Finland, and the United States have recently been published in articles and reports, most recently by Moritz Rosenmund. This five-country study was initiated in order to develop both theoretical and practical understanding of curriculum processes.

Already a theoretic approach based on earlier research in Germany has been suggested by this

project. It addresses the administration of curriculum as a discourse connected to, but different from political activity on the one hand and pedagogical practice on the other hand. This theoretical viewpoint is founded upon existing curriculum history theory, based upon historical research on curriculum administration, and also upon recent research on curriculum making in the German Federal Republic in the period 1970 to 1985, conducted by Hopmann and Haft.

The focus of this research is on the rise of curriculum administration and on the development of curriculum guidelines at a state level. A central topic within this research has been the ordering and selection of curriculum content as it is institutionalized as a result of the historical evolution of curriculum administration, resulting in restraint on future possibilities for development and implementation.

### *Governance and Evaluation of Curriculum Reform*

The governance of curriculum reform in continental Europe has since the 1990s seen a new operational style where management by overall objectives has been put in place. Management by objectives has become a key concept in the vocabulary of politicians and bureaucrats. The idea is that specific rules should be replaced by major political goals that set standards for the public sector while avoiding restrictions on professionals to organize their work.

The evaluation of curriculum reform is naturally an important project and of growing interest as part of curriculum studies in continental Europe and naturally linked to the governance of curriculum reform. Moreover, system evaluation is regarded as a way of securing quality, efficiency, and implementation of political decisions. One project, *Achieving School Accountability in Practice*, may be looked upon as a relevant example.

Issues related to the governance and evaluation of curriculum reform seem to gain a growing interest in European curriculum studies especially when projects such as TIMSS and PISA related to comparative evaluations of student standards reveal negative findings in many European countries. At a 2007 meeting in Austria at the University of Vienna, curriculum researchers from different European

countries discussed and questioned the validity and reliability of especially the results from the PISA tests, resulting in a publication. No doubt this will give rise to related relevant curriculum studies.

### *Research on Information and Communication Technology*

A recent trend in the field of curriculum studies is linked to research on learning processes and information and communication technology. The relevance of the field to European curriculum studies is already apparent in a publication from the University of Maastricht in 1999.

---

## EXCELLENCE

---

Excellence refers to emphasizing specific curricular areas in hope of best ensuring economic growth and national unity. Excellence may be viewed through a variety of historical contexts, but is generally a reaction to schooling aims and practices that impair students' ability to compete in the local, national, or global marketplace, and strives for the development and transmission of national unity and civic literacy. A central means of doing this is through the creation and implementation of content-area standards assessed through standardized testing and/or a national curriculum. The excellence movement in the United States has had a profound effect on educational policy nationally and curriculum studies within the academy as many of the initiatives, curriculum, and research agendas constructed are grounded upon the central notions of this quest.

What makes the excellence movement distinct from other curricular movements is its emphasis on collective concerns such as economic growth and national unity. The quest for excellence can be seen as an imposition on the schools insofar as the movement resulted from events that occurred outside of the schools. During the middle of the 20th century, the excellence movement developed in two interrelated ways. First, schooling in that era brought forth sharp criticism against the anti-intellectualism of the public schools from academicians and military leaders such as Arthur Bestor and Hyman Rickover. Second, *Sputnik I's* launch on October 4, 1957, drew focus toward matters thought essential to national defense and unity.

One manifestation of this was the 1959 Woods Hole conference at which academics and scientists attempted to deconstruct the central tenets of specific academic areas. The excellence movement led to much educational experimentation in the 1960s and 1970s and emphasized the need for schools to deliver specific content (e.g., math and science) seen as important to the economic growth of the United States and instruction that fostered national unity. This experimentation provided fertile ground for curricular theorists to construct a variety of educational programming that either supported the goals of the excellence movement or constructed other opportunities for children that emphasized the whole child.

In 1981, then Secretary of Education Terrel Bell sponsored a commission to examine the quality of U.S. education. The result of this work was the 1983 publication of *A Nation at Risk: The Imperative for Education Reform*. The report was authored by university presidents, school board members, school administrators, business executives, and a teacher, and focused on content, expectations, time, and teaching. *A Nation at Risk* also included suggestions for correcting the alleged deficiencies of the schools in the areas of content, standards and expectations, time, teaching, and leadership and fiscal support. *A Nation at Risk* called for increased rigor and standardization within a limited range of curricular areas to better prepare students for work in the economy to keep the United States competitive, as well as training the best and brightest children in high needs like science, technology, engineering, and mathematics. Like the work in the previous decades, the correctives suggested in *A Nation at Risk* were grounded in the collective economic needs of the United States as tied to the future growth and security of the nation.

From the 1990s through the present, a variety of other educational reforms attempted to advance the excellence in education movement. Reforms and programs such as Goals 2000, No Child Left Behind, the American Competitiveness Initiative, and national and state standards impacted what is taught and how curriculum is delivered. Discussions regarding the training of highly qualified teachers also affected these issues. Even though a greater focus on the individual child's performance existed previously, these reform movements were driven

primarily by the economic and security needs of the United States. Each of the reforms and programs associated with the excellence movement limits access to curricular experiences outside those viewed as essential for global competitiveness and national security. Mastery of the essential skills is demonstrated almost exclusively through standardized tests. The increased centralization of and federal funding for educational programming that focuses on particular content areas as leading toward specific areas of study as the child matures is a hallmark of the current quest for excellence. The tensions between the underlying principles of the excellence movement and other movements that primarily emphasize citizenship, equity of opportunity, socialization, or autonomy are central in curricular studies located in the academy and public schools as well as policy makers at the state and national level.

## EXCLUDED/MARGINALIZED VOICES

---

The concept of excluded/marginalized voices is rooted in Black feminist thought. Emerging during the late 1960s, the concept of voice has played a central role in Black women's writing. Black female academics aimed at creating a powerful voice that linked the historical subjugation of Black women's knowledge to the way in which

knowledge has been produced both within and outside of the academy. By establishing a connection between voice, the personal experiences of marginalization, and political resistance, this work contributed to new methodological approaches that challenged traditional sites of knowledge production. These scholars struggled to give voice to the experiences of communities that were traditionally excluded from, marginalized by, and subjugated to official knowledge.

Feminist scholars joined curriculum theorists to probe how and what knowledge was legitimized not only within academic research, but also in all educational institutions. The concept excluded/marginalized voices developed with the underlying premise that educational institutions are a microcosm of larger society. Schools reproduce social inequities by reflecting and perpetuating dominant cultural attitudes and values. Educational practices exclude certain voices while privileging others by positioning certain ways of knowing as objective and devoid of racial, gender, and class politics. In addition to excluding individual voices, the exclusion of particular issues and experiences from curriculum and policy debates has had the effect of silencing and further marginalizing collective voices. This structuring of silence occurs as power dynamics sustain and legitimate the silencing that occurs at an institutional level. Curriculum scholars have critically challenged policies, discourses, and practices that enabled the structuring of silence. This is often accomplished through the analysis of discursive practice, as well as highlighting the complex ways in which gender, race, class, sexual orientation, and other categories of marginalization intersect.

Within the larger aim of democratizing schooling, curriculum scholars attend to these processes, as they recognize that even within structured silence the dissenting voices of students and teachers can be heard. Curriculum theorists ask how these silenced spaces are created and simultaneously resisted. In this way, they have moved beyond the concept of silence by demonstrating that those in the margins not only do speak, but also their voices sometimes tell us a great deal about how educational structures actually work. Drawing on feminist scholarship, such as bell hooks's early works, the concept excluded/marginalized voices has thus shifted from a metaphor of space (on the margins)

to one of sound, focusing on the practices of silencing as well as resistance through voice within and around schools.

Within curriculum studies, the conceptual use of excluded/marginalized voices is interdisciplinary. The term bridges feminist, critical, postcolonial, literary, legal, and multicultural theory. This is related to the interdisciplinary nature of its foundations in feminist thought. Feminist scholars have drawn on curriculum studies to link voice, marginality, and silence to concepts of conscientization and self-actualization. bell hooks's prolific work on pedagogy exemplifies the trajectory of the concept of voice between Black feminist thought and curriculum studies. Drawing extensively on Paulo Freire's framing of education as the practice of freedom, bell hooks sees the classroom as a space where all students can participate in the process of coming to voice, questioning dominant truths and authorities that have systematically excluded and marginalized voices both within and outside of the classroom. Henry Giroux has contributed to this conversation by attending to how power operates and is implicated in the production of knowledge. He notes the important ways in which youth resist silencing mechanisms by producing their own modes of expression through which to resist dominant narrative and tell their own stories.

To counteract the externally imposed curriculum, bell hooks, Paulo Freire, and Henry Giroux advocate the creation of spaces where students may cross from margin to center in their journey toward self-actualization. Through critical pedagogy, students shift from viewing themselves as objects to subjects, and learn to speak out or talk back from the margins. Inherent in the shift from object to subject, is the idea of reclaiming voice. As subjects, students have the right to define their own reality, claim their own identifications, and name their histories. As bell hooks notes in *Teaching to Transgress*, when individuals or communities are spoken for and about, their own voices are defined by those with power to speak and name. Silence, however, does not always operate through the lack of speech. Building on the work of W. E. B. Du Bois, curriculum scholars interrogate the ways in which social location constrains the ability to speak, even when students are vocal. Within institutional contexts, marginalized students engage a form of

double talk through which they adopt the dominant language and values of society inside the classroom. This is in contrast with voices that are filled with everyday experiences and linguistic codes outside the classroom.

Curriculum work on marginalized voices also explores the importance of honoring voice in all methodological, ethical, and process-related decisions. Hence, scholarly works on voice all share a strong commitment to honoring the voices of research participants, as well as interrogating the researcher's location of privilege as researcher and authority figure. Feminist researchers explore the use of ground-up approaches to neutralize power between researcher and subject in order to honor both the integrity and authority of participants' voices. Just as scholars deconstruct dichotomies between subject-object in their research, researchers must strive for a language that breaks down binaries between objective knowledge and the subjective stories and experiences of the people they wish to represent through their work.

Educational and research practices must continue to promote what bell hooks defines as engaged pedagogy, a critical pedagogical approach that seeks to counter White supremacy, patriarchy, and capitalism. Curriculum scholars continue to examine the way in which students and teachers experience silencing within schools. More recent work on excluded and marginalized voices include writings on sexuality, White working-class male identities, the culture of power in classrooms, the experiences of African American teachers and students, heterosexism and homophobia in the schools, and critiques on global capitalism and new imperialism.

## EXPERIENCED CURRICULUM

---

The experienced curriculum refers to how the child responds to, engages with, or learns from the events, people, materials, and social or emotional environment of the classroom. The concept of experienced curriculum is not synonymous with either child-centered curriculum or teacher-centered curriculum. Consideration of the experienced curriculum as a measure for student learning requires that the holistic, experienced meaning that classroom participation has for children is determined and then evaluated against the significance of that experience in terms of its educational value.

The experienced curriculum may be influenced by, but is not necessarily aligned with, the planned or intended curriculum as designed by the teacher or imposed by other external forces. It differs from other levels of curriculum (including mandated, formal, and operational) because it focuses on the students' actual learning and is not assessed by an objective or standardized test score. The experienced curriculum is affected not only by the planned curriculum, but is also greatly impacted by the physical surroundings of the classroom, the interpersonal behaviors of the other students, the teacher, and so on. It constitutes the child's holistic response to classroom events during any given teaching episode. What the child experiences emerges from his or her personal and academic background, personality, disposition, needs, purposes, and intellectual capability in relationship to what is available within the event.

The experienced curriculum can be difficult to observe. Just watching a child may or may not tell the observer what learning is occurring within the mind as a result of the teaching. Further, asking children what they learned is fraught with

difficulty because their responses may not reveal the actual depth or accuracy of all they learned. Planning for or controlling what students experience during the teaching and learning periods of the day is even more challenging. No matter how carefully constructed the curriculum is, it is the children who interpret the curriculum and the content they are engaging in. Furthermore, classrooms are interactive spaces where multiple learners with a variety of backgrounds and interests simultaneously engage in the planned experiences. Thus, in spite of all preparations the teacher makes to adhere to curriculum mandates, the learners have control over interpreting the inputs they receive.

Attention to the experienced curriculum as a measure of learning allows educators to account for the emotional and social as well as the intellectual growth of the child. Awareness of students' experiences within a curriculum provides educators insight into those occasions when students' engagement and satisfaction with subject matter or classroom learning activities converges or diverges from the intended learning curriculum. The concept of the experienced curriculum, as a measure of life in classrooms, draws educators' attention to how and what children are learning. It asks that educators consider the child's experience rather than scores on achievement tests as the most important indicator of the quality of classroom instruction.

In exploring the roots of the experienced curriculum concept, John Dewey's thinking about the value and centrality of the child's experience in the learning process is visible. Joseph Schwab's practical and curricular commonplaces—teacher, student, content, and cultural milieu—are also evident. Most prominent is John Goodlad's model of curriculum inquiry. In this model he begins with society's identification of what knowledge is of worth, moves through national, state, and local mandates for educational goals and objectives, to teachers' instructional objectives and classroom plans. Juxtaposed against more formal representations of curriculum, Goodlad calls attention to the child's experience with that curriculum as the most vital indicator of its success. An ongoing concern with using the experienced curriculum as a measure of student learning continues to be how to adequately and accurately uncover and evaluate

all that the child learns within and beyond the intended curriculum.

---

## EXPERIENTIALISM

---

Experientialist curriculum theory and practice is a category, tendency, or school of thought in curriculum studies. The position asserts that curriculum should consist of learning experiences, not merely academic content or behavioral skills. For learning experiences to be internalized, a learner must relate them through careful reflection to previous experiences in life and aspirations for the future. The experientialist line of curriculum studies originated at the beginning of the 20th century, though its roots can be traced from John Dewey to Francis Parker and earlier to Johann Friedrich Herbart, Friedrich Froebel, Leo Tolstoy, Johann Pestalozzi, Jean-Jacques Rousseau, humanist, and humanist educators of the Renaissance, who revived the work of Quintilian and others.

Experientialists are associated with traditions of progressive education and the emphasis that John Dewey placed on learning from experience. Interests, perceived needs, and concerns of learners are seen as legitimate starting points for education. Teachers, thus, need to be aware of

student histories, contexts, and autobiographies and they need to involve students in decision making so they can learn to self-educate, becoming their own curriculum directors. Surface interests, when pushed to the deeper levels, reveal shared or common human interests. For example, these might include birth and death, justice and equity, love and hate, peace and war, how to live together, anxiety and depression, humor and joy, and more. The experientialist position is not content-free as some critics contend. Rather, the disciplines and informal areas of study are tapped by students to enhance reflection and to make their pursuit of interests more robust. The theory holds that expansive understandings will evolve as students deepen and broaden their interests as facilitated by good teaching. Moreover, experientialists advise that interests pursued lead on to other interests, in and out of school, and evolve for a lifetime.

Many different educators are considered as contributors to the experientialist line of thought. Early in the 20th century, Dewey and his progressive followers, such as Harold Rugg, Ann Shumaker, William H. Kilpatrick, Caroline Pratt, and L. Thomas Hopkins, are key examples. Rugg and Shumaker are known for the term child-centered school, Kilpatrick for the project method, Pratt for emphasizing that teachers should learn from the children they teach, and Hopkins for emphasizing integrated curriculum that led to democratic forms of interaction to enhance the emerging self. The Eight Year Study of the 1930s and early 1940s offered insight into school practices that actualized the potential of such ideas. In this landmark study, both students and educators learned from experience of their experimentation. Origins of both integrated curriculum and core curriculum can be found in reports and interpretations of The Eight Year Study. Such experientialist practices criticized the organizing center of curriculum as knowledge presented in an encyclopedic manner. Alternatively, the student became the organizing center. For Hopkins, fostering or facilitating the emerging self became the hub around which all learning experiences turned, and for Harold Albery, the core of studies was social problems that directly affect student lives and the seed of concern for both personal and democratic growth—in search of a better life. One can turn to

work by James Beane on integrated curriculum in middle schools for contemporary versions of core and integrated curriculum.

Dewey had argued, based on his renowned Laboratory School at the University of Chicago, that learning in school should imitate the best learning in life, and in 1938, he tried to forestall a growing split between advocates of experientialist child study and experientialist attempts to reconstruct society to be based on fundamentally different assumptions about social and economic life. In *Experience and Education*, published in 1938, he tried to show that knowledge, social needs, and individual needs could all be integrated if we thought about it more deeply. At the same time, philosopher of education Boyd H. Bode also argued for proponents of social reconstruction and child study to realize common purposes through democracy as a way of life, urging experientialists not to become divorced at the crossroad of child study and social reconstruction. Nevertheless, the social context of the time and disputes among educators prevailed, resulting in a dearth of experientialist practice until the 1960s.

In the 1960s, counterculture educators, such as A. S. Neill, Sylvia Ashton Warner, Jonathan Kozol, Herbert Kohl, George Dennison, James Herndon, John Holt, and others reported on practices of reaching student needs through interests, thus, tying education to life experience.

The reconceptualization of curriculum thought that emerged in the 1970s through work of James B. Macdonald, Dwayne Huebner, Maxine Greene, Ted T. Aoki, and others drew upon not only the pragmatist tradition of progressive education in Dewey and others, but through existentialism and phenomenology and issued in a new source of experientialism. Captured in the term, *currere*, the active verb form of the noun, *curriculum*, educators and students alike were encouraged by William Pinar and Madeleine Grumet to engage their present moment by reconstituting their past experience through reflection in anticipation of possibilities for alternative futures.

Critics of an experientialist approach hold that student interests and concerns are not valid indicators of needs, because students are too immature to know what is in their best interest. Moreover, some contend that experientialist

education does not provide adequate coverage of the realms of knowledge, skills, and dispositions that experts know are needed in life. Experientialists counter by arguing that students who are autocratically prepared will never learn the goals of self-education and democratic participation.

## FAMILY AND CONSUMER SCIENCES CURRICULUM

---

Through the years, the central focus of the family and consumer sciences profession (previously known as home economics) has changed from skills needed to operate an efficient home to knowledge required to become a professional in a specialized field. The home economics and family and consumer sciences curriculum evolved from training for work in the home to the study of the family and its internal and external relationships. Curriculum planners used current job market demand to develop curriculum in career-oriented specializations.

The formal home economics movement (later known as the field of family and consumer sciences) began in the mid-19th century as an ideal curriculum for women's study. It included the practical application of art and science to skills needed to properly maintain a home. Women taught the subject in a variety of venues such as women's clubs and schools at all levels. It carried such names as domestic science, domestic art, and domestic economy. Then, from 1899 to 1909, participants at the 10 Lake Placid Conferences established the field and developed cohesive curriculum for home economics. The field of home economics with integrated, focused curriculum designed to imbue arts and sciences into homemaking grew rapidly through the middle 20th century. Federal legislation and funding influenced the curriculum development of homemaking

programs in secondary schools and cooperative extension programs in adult education. In the second half of the 20th century, as more women began to demand careers outside the home, the traditional home economics curriculum lost relevancy, forcing home economics curriculum leaders to change from integrated to more specialized, vocational-prone programs. One manifestation of the upheaval is the 1993 changing of the name of the field from home economics to family and consumer sciences. The history of the home economics and family and consumer sciences curriculum is relevant to the field of curriculum studies because classic curriculum dilemmas and changes emerged over the course of the 100-year history of home economics and family and consumer sciences.

The number of women working full-time increased steadily in the second half of the 20th century. This phenomenon caused a profound effect on the family including changes in dietary habits, child raising, and family patterns. As the family evolved, home economics and family and consumer sciences experienced difficulty keeping its mission central. Throughout the 1960s, professionals in the field of home economics struggled with the conflicting focus of preparing homemakers and career women, and college curricula reflected this conflict. Women traditionally had chosen either a career or marriage, but few women selected both options. The curriculum reflected society's ambivalence about women's domestic and career roles through the continued offering of a general major for young women who intended to become full-time homemakers along with the

development of management courses that encouraged women to plan their time so that they could perform both roles well. However, some curriculum planners began to recognize that the time had come to develop programs for students who wanted a career in a specific profession rather than as a homemaker.

By the end of the 1960s and 1970s, more and more home economics graduates sought lifelong careers outside the home, and higher education curricula became increasingly specialized. Home economics moved farther away from its original vision as an integrative field. The profession continued to respond to market demands by developing curricula that would educate graduates for the jobs available. The focus shifted away from the development of skills needed to manage a home and toward the development of knowledge and skills needed for a career in a specialized field. Relentlessly, curricula transformed from general to specific.

Colleges and universities offered specialized programs in areas that had once been part of the integrated whole of the home economics curriculum. The clothing and textiles areas became fashion merchandising, fashion design, and textiles degrees. The home management areas became hotel and institutional management, financial management, consumer studies, and housing. Interior designers developed highly specialized curriculum with strict accreditation standards. Food and nutrition evolved into the dietetics field with an accompanying certification called the registered dietitian. Child and family relations curricula evolved into a variety of programs including early childhood education, family therapy, and social work. Many of these specialized programs now have their own professional organizations and accreditations. Others have aligned with their base disciplines rather than family and consumer sciences.

By the end of the 20th century, most colleges and universities had ceased offering either a common set of courses for their majors or the general home economics degree. The traditional home economics curriculum as developed for women who would become homemakers in the beginning of the century no longer is in existence.

The first decade of the 21st century has brought even more specialization to curricula in colleges and universities and secondary schools. In addition,

unprecedented accountability permeates all levels of education. Family and consumer sciences curriculum planners at the university level continue to develop curriculum based on market trends as secondary schools work to meet the requirements of the Perkins federal legislation. Extension agents continue to determine the needs of local communities and plan programs within the expertise of the Cooperative Extension Service.

By 1993, the field had been renamed family and consumer sciences, but higher education had already undergone a frenzy of curriculum and name changes. The former home economics academic units in U.S. colleges and universities were named human ecology, family sciences, human environmental sciences, family and consumer sciences, or other designations. No unifying curriculum could be considered typical of most historically home economics academic units. The cohesive, integrated field of home economics from 1960 no longer existed. However, professionals in the field recognize that while the historical focus of home economics and family and consumer sciences may no longer be relevant, the diverse and integrated needs of families, individuals, and communities remain. Experts in all the specialized areas of family and consumer sciences continue to work in service careers and as volunteers to improve the lives of the people around them. In this way home, economics and family and consumer sciences thrives through the diverse curriculum and the careers of the myriad professionals practicing today.

## FAMILY AND CONSUMER SCIENCES CURRICULUM, HISTORY OF

---

The curriculum of family and consumer sciences (home economics) symbolized the field's unifying focus and in higher educational institutions reflected the changing conception of home economics and family and consumer sciences throughout the 20th century. The concepts taught in traditional home economics and family and consumer sciences curricula embodied the prevailing notion of essential knowledge in the field. These ideas developed into courses in the following subject areas: family relations and child development, textiles and clothing, housing and interior design, home management and consumer economics, foods and nutrition, and home economics foundations and professional development. These subject areas formed the organizational center of home economics and developed into the curriculum. However, the integrated curriculum has given way to a more specialized curriculum as home economics and family and consumer sciences have moved into the 21st century.

The 19th century society began to allow access for women to public college education, and home economics evolved as a curriculum especially designed for them. Young women learned the science of planning homes that could be built with sanitary and safety features. Home decoration and clothing design utilized art principles. Scientific discoveries helped to build knowledge in cooking, cleaning, and laundry. The 10 Lake Placid Conferences (1899–1908), hosted by Melvil and Annie Dewey, founded the field of home economics. These conferences formally recognized curricula that had been taught to young women in varying forms since colonial times and established the study of these curricula in higher, secondary, and adult education. The education of women in the 18th and 19th centuries in the United States included home taught needle arts and social skills. In the late 19th century, Ellen Swallow Richards,

the founder of home economics, wanted to develop a new field of study that utilized science to improve the environment of the home. A chemist, she developed sanitary standards for home cleanliness using chemistry, biology, and physics. She advanced her goal of practical application of science to home economics through her leadership in the Lake Placid Conferences.

The Lake Placid Conference participants formalized home economics as a discipline and determined knowledge and skills needed by homemakers and those who would teach them. Even in the early years of these conferences, leaders articulated two worldviews about how the curriculum should be conceptualized. Should the home economics curriculum reflect an empirical, positivistic, or an interpretative field of study? These two modes of thought, empirical versus interpretative, profoundly influenced curriculum development early in the 20th century; however, most home economics curriculum developed in the direction of the empirical science group. Therefore, early curriculum emphasized skill orientation and developed empirically, working within society rather than attempting to change society.

### Curriculum in the Early Years

In the late 19th and early 20th centuries, many colleges and universities founded baccalaureate programs in home economics. Early curricula focused on the skills needed to improve the home environment. Required courses included sanitation, hygiene, laundry, and home building for proper ventilation, heating, and plumbing. Curriculum planners considered the concepts taught in these courses as essential to the health and well-being of family members. The homemaker also produced many goods and services, and the curriculum emphasized skills needed to make clothing, food, linens, and decorative accessories. Each school conceptualized the essential knowledge differently and required diverse subjects such as floriculture, entertainment, hand sewing, and millinery. Model courses from these years seem archaic today. For example, many schools offered a household sanitation course that included instruction for building a home with proper sanitation through plumbing, ventilation, heating, and lighting. Students also learned how to keep an existing home clean and sanitary in this

course. Necessity created this early interest in sanitation because several deadly diseases thrived in impure water. Scientists had only recently discovered the dangers of mixing untreated sewage and drinking water sources. New scientific knowledge resulted in better planning and placement of out-houses so sewage would drain away from drinking water sources. In addition, the skills taught in the home economics curriculum helped the homemaker to become more efficient in her massive workload.

Many colleges and universities required home nursing as a part of this applied science curriculum. In the early years of home economics, sick family members stayed at home to be treated. Doctors called at the home to diagnose the illness and to give treatment instructions to the care giver, usually the homemaker. Therefore, the early home economics curriculum included home nursing concepts. As medicine and hospitals became more effective, these home nursing concepts grew less necessary and disappeared from the home economics curriculum.

Students learned skills that represented the artistic orientation of the curriculum including hand sewing, embroidery, knitting, crocheting, weaving, and other fancy hand work. Earlier programs utilized primarily hand sewing instruction for the curriculum. The embroidery and art courses included mastering many advanced handwork skills such as French eyelets, initials, and feather stitching. Some early programs required a separate course in millinery, the art of making hats. The textiles courses at some schools emphasized the artistic home production of fabric. Textiles course planners later dropped the artistic components and emphasized the chemical composition of fibers and their characteristics as well as an industrial understanding of the construction of fabrics. Weaving and fabric design moved out of most home economics units.

Other artistic courses included clothing design and dressmaking. As commercially made clothing became readily available, hand sewing courses disappeared. Remaining courses prepared students to construct their own clothing using commercial patterns and sewing machines. Laundry claimed a large part of the woman's work week, and washing had to be done by hand, a task made more difficult by voluminous and heavy clothing. Washing machines helped with the work; however, the labor remained intense. The laundry course encompassed laundry equipment,

chemicals, starches, stain removal, and handling of various fiber types. As time passed, however, academic institutions eliminated these skill courses in favor of theoretical curricula.

In housing and interior design, faculty taught design principles so that students could apply them to home decoration and clothing production. A typical course in theory of design included design elements and principles and color analysis. Students used these design principles to plan and select home decor.

Most institutions' early curricula did not require courses in family relations or child development. Curriculum leaders gradually added them in the 1920s after the psychology discipline gained recognition. Several courses prominent in the earliest curricula disappeared as the central concepts solidified in the early decades of the 20th century.

In the early 20th century, society expected women to labor in the home, and home economics programs provided an education aimed at developing efficient homemakers. Curricula presented a single set of courses for the baccalaureate degree in home economics. Women utilized their education for one of two vocations: homemaking or teaching other women homemaking skills. The historical curriculum in home economics reveals leaders' notion that all majors should have a breadth of knowledge in the field's subject areas. The traditional curriculum assumed that all home economists embraced the common mission of improving home living and therefore should master a broad base of knowledge about the home. The development of curriculum in home economics and family and consumer sciences echoes themes in development of curricula in other fields and institutions. The dichotomy of integration and specialization framed the issues that emerged as home economics continually searched for the combination of courses and concepts that best focused the field.

In response to the difficult economic times of the Great Depression years of the 1930s, colleges and universities developed courses in management of scarce resources. During this era, home economists began to divide academic subjects into five categories:

1. child development and family relationships;
2. housing, equipment, and home management;
3. family economics and consumer education;

4. foods and nutrition; and
5. clothing and textiles.

The curriculum of the 1940s reflected society's needs during World War II and recovery. Because many women worked in traditionally male jobs, the need for child care temporarily became necessary resulting in an increased interest in studying child development and family relationships. Home economists served the war effort by developing food conservation programs, nutrition classes, child care centers, and industrial feeding programs. Research in textiles, clothing, nutrition, and foods increased as home economists helped to determine better ways to clothe and feed the troops.

The family began to change after World War II, again shifting the mission of the profession of home economics. During the war, women worked in large numbers to assist in the war effort. Immediately after World War II, the family had irrevocably changed, but most families attempted to return to prewar lifestyles. Women made room for veterans in the workplace by returning to full-time homemaking. However, by the 1960s, increasing numbers of women returned to the labor market.

College curriculum in home economics reflected society's ambivalence toward the dual role of homemaker and full-time worker. Most colleges and universities continued to offer the general home economics undergraduate major designed to train women to be homemakers. However, as women continued to seek careers outside the home, the need for more specialized majors developed.

### Curriculum in Mid-20th Century

By midcentury, leaders developed a fairly standardized home economics curriculum that dominated the field, reflecting certainty that this constituted essential knowledge for entry-level professional home economists. Institutions required students to study a balanced curriculum with a sampling of courses from the artistic and scientific areas of the field. These courses carried over from the early years when the domestic science and domestic art areas combined to form home economics. The basic art course, usually taught by interior design faculty, emphasized an appreciation for art elements and principles as they applied to design in the home environment. Art, sewing skill,

clothing selection, and consumer concepts combined to form the typical clothing and textiles curriculum. An often required beginning clothing construction course typically included selection of commercial dress patterns and development of skills needed to sew a garment.

The basic courses in foods and nutrition included concepts in preparation of food and in the relationship of eating nutritious food and good health. Home management courses included wise use of money and resources such as time and energy, such as balancing both career and homemaking. In family resource management, students studied home management philosophy, work simplification, planning for family financial security, and general management of all the family's resources. Family finance courses included concepts in banking, credit, and insurance. Household equipment involved the selection, use, and care of large equipment and small appliances and the understanding of the energy sources of gas and electricity.

Home management residences simulated a traditional home environment and integrated skills and essential knowledge learned in the home economics program. This capstone course required students to live together in a residence under faculty supervision. They operated a house by planning meals and parties, shopping, cleaning, and laundering. Some schools even arranged for the home management residents to care for an infant. This course emphasized integrated skills that had been associated with traditional expectations of full-time homemakers in the first half of the century. As homemakers' roles changed, the need for the course diminished. By 1990, most home management residences had been closed and the course eliminated.

The area of child development and family relationships contributed courses to the curriculum. Marriage and family relationships courses contributed the knowledge about courtship, marriage, and the family through the life cycle. The course in child development typically studied the growth of the young child to age 6 and was a requirement in the general home economics baccalaureate degree.

### Adult Education

Cooperative Extension Agents, affiliated with land-grant universities, consistently developed and delivered the majority of the home economics

adult education through the 20th century. Land-grant universities are institutions of higher education established in each state as a result of the Federal Morrill Acts of 1862 and 1890. These federal programs gave land to the states for use in funding the institutions. The land-grant colleges and universities provided a practical education in agriculture, home economics, military tactics, and mechanical arts to members of the working class. Later legislation established experiment stations to conduct research on improving agriculture. The Smith-Lever Act of 1914 brought federal funding to land-grant universities to distribute their research to rural families. The funds established the Cooperative Extension Service, a virtual army of agents from departments of agriculture and home economics to teach the adults and youth of a rural community new knowledge about farming and homemaking. These agents lived and worked in the communities they served giving trusted advice on a variety of issues. The agents also developed 4-H programs in which youth learned skills, researched, and competed in areas emphasized by the Cooperative Extension Service.

Throughout the first half of the 20th century, the Home Economics Cooperative Extension Service taught adults and youth basic skills such as cooking, sewing, entertaining, meal planning, and canning. In the second half of the century and into the first decade of the 21st century, rural families decreased dramatically, and the cooperative extension service curriculum shifted to serve the needs of the changing population demographics. As the constituent needs changed and more urban persons required assistance, county agents selected projects based on needs of the communities they served. Curriculum has evolved to consist of subjects such as food, nutrition, teen pregnancy, child development, financial literacy, and safe handling of food.

### Secondary Education

The Smith-Hughes Vocational Act of 1917 pledged federal funds to public school homemaking programs. This vocational act defined homemaking as an unpaid vocation, and for many years, the secondary education homemaking programs received special funding as a separate line item within the vocational budget. This level of funding allowed

for funds to go directly to homemaking programs at the local level with no state reallocation of the money. The Smith-Hughes and Smith-Lever federal programs helped to solidify the college curriculum in home economics because a baccalaureate degree was a requirement for employment as a public school teacher or extension agent. At the high school level, homemaking teachers taught a curriculum that closely reflected their college curriculum; however, to continue receiving vocational funding, the curriculum followed the mandates of the federal Smith-Hughes Act. The students learned in an experiential curriculum in which they prepared long-term projects in and out of the classroom. Another large part of the experiential curriculum was the vocational youth organizations, the Future Homemakers of America and New Homemakers of America (African American youth organization). These two organizations merged in 1965, becoming the Future Homemakers of America. In 1999, the organization changed again to Future Community and Career Leaders of America, reflecting a continuing trend toward job preparation in the high school curriculum.

Each renewal of the Smith-Hughes Act and subsequent vocational acts brought new mandates for vocational homemaking programs. In the second half of the 20th century, the federal vocational mandates began to recommend and then insist that the home economics and family and consumer sciences programs train students more for careers and less for homemaking. This trend reflected the changes in society and the need for everyone to develop job skills.

As the first decade of the 21st century comes to an end, the new career and technical education act is the Carl Perkins Act. In home economics and family and consumer sciences, the curriculum interprets the act by emphasizing career paths and outcomes. The programs continue the trend toward career development and away from homemaking. Many state curricula utilize the national Family and Consumer Sciences Standards developed in 1998.

## FEMINIST THEORIES

---

Feminist theories are multiple, hybrid, complex, and changing. There is no one homogeneous, unified feminism or feminist theory. And although it is impossible to illuminate all aspects and variations of feminist theories in this entry, even when narrowed to the field of curriculum studies, it is possible to say that feminist theories are conflicting as well as intertwined, in response to one another as well as to particular social and cultural contexts and historical moments. They are part of, and yet critique from diverse theoretical orientations, the broader feminist political movement that seeks to rectify sexist discrimination and inequalities. Further, in their many variants, they do center and simultaneously problematize conceptions of the categories woman and gender identity, for example, and the various situations, embodiments, contexts, and institutions that frame diverse lived realities.

Together, feminist theories represent wildly divergent theoretical orientations, methodological, and analytic approaches and often incompatible

approaches to the category gender and the social, psychological, and historical systems within which sexual identity becomes meaningful. Feminist theories often self-identify as representative of certain ideological positions, theoretical orientations, and disciplinary boundaries. And yet, given contemporary and rapidly changing contexts of globalization, theories simultaneously are destabilized through intertextuality, interdisciplinarity, and efforts to understand implications of race, ethnicity, nationality, class, sexuality, colonialism, and imperialism, for example, as intertwined with gender and as fluid and changing categories and forces that organize social and symbolic systems.

One typical way of attempting to grasp as well as to consider the now vast research and literature as well as widely varying theoretical orientations of feminist curriculum scholars, teachers, and activists is to align various work within the chronological groupings neatly identified as first, second, and third wave feminisms. Many other ways of identifying and grouping feminist theories are possible, of course, and even nomenclature attached to historically organized distinctions varies. Further, no matter how one attempts to organize and group prominent feminist theories, within each attempt are countless examples of widely differing epistemological and ontological assumptions and framings.

Within curriculum studies, however, it is prudent to adopt this chronological schema, given that feminist theories and studies that first appeared in the U.S. field during the 1970s are most congruent with characteristics assigned to second wave feminist theories and practices. Into the 21st century, a wide variety of feminist theories have proliferated in curriculum studies worldwide and yet may still be identified as loosely aligned with overall assumptions and characteristics of major feminist theories generated within the second and third waves, especially.

### First and Second Wave Feminisms

First wave feminism, labeled retroactively as such in the 1970s, refers to pioneers of the women's movement and that phase of feminist activity during the 19th and early 20th century in the United Kingdom and the United States. It focused on

officially mandated inequalities, primarily on gaining women's right to vote, the right to own property, economic independence, and the right to work for a reasonable salary. Both first and second wave feminisms largely were confined to White, middle- and upper-middle class Western, mainly northern hemispherical women, an issue that was taken up within second and third wave feminisms from a variety of theoretical as well as subject-position orientations and concerns.

The second wave of the women's movement in the United States generally refers to a period of feminist activity and theorizing that began during the early 1960s and lasted into the 1980s. Second wave feminism addressed a wide range of issues, including sexual harassment, equal pay, access to education and jobs, official legal inequalities, sexuality, family, the workplace, and perhaps most controversially, reproductive rights. These foci led to general consensus on the need to establish theories of social causation, which most agreed lay at the level of social structure; to establish a feminist epistemology; and to examine the relationships between theory and practice and among experience, subjectivity, and theory. In fact, many second wave feminist theories assumed that a specific cause of women's oppression could be specified. Theories focused on a patriarchal system of inheritance, male control of women's fertility and reproductive rights, and capitalism's need for a docile labor force.

Both first and second wave feminisms were crafted through what often is generically called liberal feminism, whose theories assumed a notion of the universalized category, woman. Assumptions about that category and the focus on political struggles for rights, equity, and emancipation from patriarchy (within this general framing, also a universalized category) most often have been grounded in Enlightenment narratives of a unitary, fully conscious self, individual agency, and a general theory of oppression and liberation.

### *Feminist Curriculum Theorizing*

Given these assumptions that characterized a range of theories within the second wave, much feminist work in curriculum studies during the 1970s and 1980s centered on projects of reclamation and critique, including theorizing ideologies

of domesticity, the feminization of teaching, women teachers' conceptions of themselves and their roles in educating and education, women's inequality in educational access, and histories of women's contributions in a curriculum field that was, from its inception, male dominated and situated within technical-rational assumptions about teaching and learning. Further, different theoretical orientations enabled feminist curriculum theorizing to range across a number of issues and emphases within the context of curriculum studies and research, writ large.

For example, some feminist curriculum scholars theorized from psychoanalytic, phenomenological, and critical theory perspectives, analyzing the pervasive impact of patriarchy on the social construction of teaching and the emergence of the feminization of teaching. Some drew on women's experiences of caring, as well as of reproduction and nurturance, and theorized these experiences as potentially positive sites of power and creativity that could influence their curricular and teaching practices. Others examined, from autobiographical perspectives, their constructions of themselves as women teachers in relation to dominant gender relations and curricular constructions.

### *Psychoanalytic Theories*

In the mid and late 1970s, feminist theories were strongly influenced by psychoanalytic models of sexuality and subjectivity, models that in turn were influenced by Sigmund Freud's and Jacques Lacan's work. A few curriculum theorists introduced into the field of curriculum studies in the 1970s the psychoanalytic work of Lacan to examine how teachers' and students' psycho-social identities are constructed in schools and in educational discourses and how these identities affect teaching and learning. Unlike Freud, Lacan removes the question of sexual identity from the realm of biology to place it in the field of signification—that is, the child is not born a subject who then acquires appropriate social characteristics. Rather, the child becomes a subject through social intervention, through entry into what Lacan terms the symbolic and thus to language.

Moving out of the work of Lacan and Freud, some feminist curriculum theorists used object relations theory, especially as represented by

feminist psychoanalyst Nancy Chodorow, a theory that turned the traditional psychoanalysis from the son and father relationship to a psychology of the relation to the mother in children of both sexes, a reading not as directly tied to the idea of cultural gender as Freudian thought. Other curricular feminists working during the second wave were influenced by the work of French feminists Luce Irigaray, Helene Cixous, and Julia Kristeva. These feminists, differently drawing from Lacanian theories of language and subjectivity as well as aspects of poststructuralist theory, reject the notion of the unified subject as a remnant of patriarchal ideology.

### *Phenomenology and Hermeneutics*

Drawing on phenomenology as a philosophy of experience, some feminist curriculum theorists focused on examining and describing their own structures of experiences as teachers, writers, researchers. Some aligned with Edmund Husserl's concentration on suspending the natural attitude of everyday knowing—to bracket the external object-world—in order to focus their attention on what is immanent in consciousness itself without presupposing anything about its origins or supports.

Some curriculum feminists found Martin Heidegger to be helpful in their work examining their underlying assumptions and expectations as women teachers and curriculum theorists in that he argued that inherent in understanding is a forestructure of beliefs and assumptions that guide interpretations. Heidegger and his student, Hans-Georg Gadamer, also provided hermeneutics with its central innovation in the 20th century—that is, they argued that hermeneutics no longer could concern itself only with understanding and interpretation of written texts or speech. Rather, they argued, drawing on Heidegger's ontological emphasis, that instead of attempting to understand something, the focus should be on understanding as the way of being-in-the-world as the primary way humans exist prior to any cognition or intellectual activity. Gadamer extends this thinking by focusing on what is already occurring when individuals encounter documents from the past, including written records of memories and experiences, something many feminists have focused on in terms of claiming their own herstories.

### *Critical Theories and Materialist Feminisms*

Versions of Marxist feminism built on the Enlightenment tradition, but stressed the importance of ideology and the centrality of class struggle to cultural analyses and social change. In curriculum studies, those who identified as materialist feminists and those who worked within the Frankfurt School of critical theory, which turned away from the traditional paths of Marxism and toward modes of theoretical and empirical social analyses of modern culture, argued for critiques of the gendered character of class and race relations under multinational capitalism. Materialist feminist theories suggest that formations of gender, including sexuality and the body, are inflected by political, social, and economic structures. Further, in what is generally known as radical feminism, some feminist curriculum theorizing focused on women's emancipation as requiring a distancing from a male-dominated society in its entirety. Although such separatist politics that also argued for the removal of global patriarchal power structures were not shared among all who identify as radical feminists, the goal of radical feminist theories included critical examinations of representations of patriarchal power and dominance in subject-matter texts as well as constructions and enactments of curriculum and pedagogy.

### *Transitions Into Feminist Theories of the 1990s and Into the 21st Century*

This sweeping and brief overview of feminist theories framed by second wave feminist concerns and foci can only gesture toward the range and depth of the work produced in curriculum studies during the 1970s and 1980s. Theorizing concepts such as oppression and patriarchy and the influence of those on conceptions and materializations of curriculum as well as of the feminized roles that positioned women as less than—as other—that dominated in the managerial and technical-rational origins of the field were crucial contributions in advancing feminist curriculum theories.

However, with the prominent political impact in the late 1980s of critiques by women of color, self-identified lesbians, and women from underdeveloped nations of racist, ethnocentric, and heterosexual assumptions of a largely Western, White, middle-class feminism, feminist curriculum theorizing began

to shift from a first and second wave general focus on issues of equality and a universalized notion of woman to issues, constructions, and the politics of difference.

### Third Wave Feminisms

Although apparent in some feminist curriculum theorizing during the late 1970s and through the 1980s, feminist curriculum theories from the 1990s to the present have been complicated dramatically by the work of those who have situated themselves at the intersections of feminisms with a number of antifoundational movements, including poststructuralist, postcolonial, and transnational feminisms. It is important to note that the concept of *post* common to some of these perspectives and discourses in no way indicates that oppressive and imperialist relations have been overcome. Rather, antifoundational theories attend to a new range of temporal, political, social, and cultural relations even as they challenge hegemonic assumptions held by second wave epistemologies that patriarchal and imperialist oppression was a universally experienced oppression, for example.

In antifoundational framings of feminisms and their contradictions, an overall goal is not a depoliticization of feminisms through a total insistence on removal of all essentialized identity categories, such as woman. Rather, the turn toward antifoundational philosophies and critiques is more a shift in conceptual and theoretical agendas that mean to address the demands of what are self-identified as marginalized, colonized, and diasporic cultures. Central to such a turn, sometimes referred to as the postmodern turn, are constructions of identity, subjectivity, and difference within feminist theoretical debates, as are foci on narrative, local, fragmented, ambivalent, and irreducible contradictions and instabilities in all conceptions and productions of human knowledge and identities.

#### *Poststructuralist, Postcolonial, and Transnational Influences*

Although well beyond the bounds of this overview of feminist theories that are infused with poststructuralist, postcolonial, and transnational perspectives, several general themes and trends in contemporary feminist curriculum theories can be

noted. Threading through the following brief examples, which highlight poststructuralist perspectives, are influences of postcolonial and transnational feminisms that call into question any assumptions that there is a pure or totally essential form of subaltern or transnational consciousness, the truth of which can be retrieved independently of the determinations of (neo)colonial forms of knowledge production as well as dominant discursive practices. Such work especially encourages scrupulous vigilance toward the terms of engagement with non-Western others and undermines foundational models of identity, which might in fact encourage reverse ethnocentrism. Such work also resists any representations of feminist theories and research as able to assimilate national (local) discourses, practices, and representations into an imperial global archive.

#### *Autobiographical Inquiries*

By focusing on poststructuralist theories that argue for a decentered notion of the subject, feminist curriculum theorists have worked to infuse autobiographical theories and approaches, for example, with research that disrupts the Western humanist idea of a single subjectivity, which at any moment is fixed, complete, and thus able to be totally represented. Instead, poststructuralist feminist curriculum theorists and researchers have shifted their emphases as regards what constructs perceptions, thoughts, emotions, memories, and actions to linguistic and discursive contexts, which socially and culturally create forms and possible expressions of subjectivity limited in time and space. These feminists work to demonstrate how language is not an expression of subjectivity, but rather constitutes subjectivity. Subjectivity, then, is more a process than a structure—something that is unstable, contradictory, and that depends, in its constant reconstitutions, on discourses that are available. Thus, depending on language, on (im)possible forms of representation, and discursive contexts, different forms of subjectivity are constituted.

Many curricular feminist autobiographical inquiries thus theorize identity, embodiment, experience, agency, and memory as constitutive processes of autobiographical subjectivity. Briefly, then, instead of concentrating on remembering or

tracing relationality and “fixed versions of identity as foundational and transparent components of autobiographical theorizing, for example, feminist poststructuralists focus on ways in which fluidities of memories and constructions of identities and interconnections with others are constantly in movement through time and across political, discursive, and geographic spaces. Autobiographical work must take on the task of disrupting any identity category that is positioned as assigned or assumed, and instead focus on implications of any identity construction as being a site of openness and thus able to be resignified in subversive and normatively disruptive ways.

### *Antifoundational Forms of Curriculum Research*

Issues of constructions of subjectivity and identity are closely related to issues and questions of possibilities of a feminist epistemology within feminist theoretical analyses and forms of research. Feminist standpoint theorists, for example, in the 1990s, modified their claims that only women and women’s experiences can generate feminist knowledge by making problematic the concepts of experience and oppression.

Current antifoundational feminist curriculum researchers have moved into troublings of research in terms of who may be counted as a knower and as a representer of others and in terms of self-knowledge. Exploring crucial aspects of the crisis in representation, rather than positioning themselves as able to produce unmediated accounts of research participants’ or their own narratives, or full chronicling of events as observed, feminist poststructuralist researchers draw attention to the politics and discursive constructions of knowing and of being known as they (impossibly) attempt to tell others and their own stories. Such research highlights, at the minimum, the paradoxes of being placed and placing selves in positions of speaking for, with, and of others from partial, situated, and densely invested positions.

Further, such feminist antifoundational research practices shift research inquiries from attempting to discern what something or someone means, to investigations of how meanings change, how they have become established as normative or have been dismissed, and how such interrogations can yield information about how power is constituted

and operates in particular contexts and local situations.

### **Feminist Theories as Always in the Making**

Multiple and vast extensions of feminist theories now are visible in all aspects of curriculum studies and inquiries, including queer theories, cultural, masculinist, gender, lesbian, gay, bisexual, and transgender, indigenous, and critical race theory studies, for example. In addition, feminist theories continue to influence aesthetic, ecological, psychoanalytic, poststructuralist, postcolonial, and transnational inquiries, to name a few currently circulating curriculum discourses. The above review only touched upon myriad issues, problematics, and theoretical framings of feminist theories, writ large.

Given that feminist theories must now respond to current worldly circumstances, including influences of global flows and mobilities on any constructions or inquiries into self and other, they also must be regarded as always on the move, always in the making, never settling into one fixed or untranslatable representation or analysis. Rather, the generative possibilities of feminist theories reside in their commitments to the necessary labor of constructing, across and with/in differences, a concept of what it means to be human that can encompass groups with very diverse ideas, contexts, and local situations. Such commitments add immeasurably to the scope and depth of curriculum studies and research.

## FORMAL CURRICULUM

---

The formal curriculum is designed as a framework for instructional planning that outlines broad goals and strategies to reach them. The foundations of the formal curriculum are based on publicly valued intellectual, social, cultural, political, and economic funds of knowledge. Knowledge, skills, and understandings that have educational value to the individual and society are included. Often a school district's formal curriculum is based on the state's curriculum frameworks. Learner-centered goals rather than teaching-centered goals are the hallmark of 21st-century curriculum. Typically, this curriculum comprises high expectations to challenge the students and be competitive with the international educational community. The formal curriculum is readily available in written documents and/or displayed on Web sites. It may also be referred to as the planned curriculum, written curriculum, or the official curriculum.

Formal curriculum generally starts with a philosophy or set of broad-based goals. It then organizes the knowledge needed to meet these goals into a scope and sequence that defines the breadth of the curriculum and the order. After the curriculum is taught, student learning of the curriculum is assessed.

Formal curriculum may be designed by the teachers in a district utilizing the state standards for the discipline, their past experience in teaching the discipline, and consultation with a discipline expert. Formal curriculum may also be developed by curriculum specialists in the district or purchased commercially and then customized by teachers or district curriculum specialists. Whether designed by teachers or curriculum specialists each curriculum is somewhat unique, based on characteristics of these individuals.

Although there are numerous types of curriculum, the formal curriculum differs from the taught or instructional curriculum and the assessed or tested curriculum in several ways. The taught curriculum is decided on by the teacher either individually or in small team groups and is based largely on the learned curriculum as evidenced by how the students respond to what has been taught. The formal curriculum often is much broader in scope than time allows for the teacher to teach; hence, the taught curriculum becomes a subset of the formal curriculum. High-stakes tests are based on standards and the formal curriculum. Key points in the formal curriculum are chosen for test items, resulting in the tested curriculum, another subset of the formal curriculum. Students balance the formal curriculum against extracurricular activities at the high school level. Students need both mastery of the formal curriculum displayed as grades, test scores, and so on and involvement in extracurricular activities for college matriculation. Finally, the formal curriculum differs from the hidden curriculum in that the formal curriculum is publicly displayed, affirmed, taught to, and tested, while the hidden curriculum is never written and is primarily based on what is not taught.

The content of the curriculum is determined by the curriculum standards and by the philosophical viewpoint of the designers. Traditionalists organize curriculum by discipline and view knowledge as objective. Constructivists see knowledge as dynamic and ever changing as it is constructed by the student. They would tend to organize curriculum by broad-based themes and build in flexibility. Due to the current trend of high-stakes tests that label schools and districts as acceptable or in need of improvement, the traditional viewpoint of curriculum has become the formal curriculum in most

U.S. schools. If knowledge is not objective, then high-stakes tests lose their foundation.

The formal curriculum is not static or value free. States have been known to change the formal curriculum in an attempt to align the formal curriculum with the taught and tested curriculum. This alignment has been deemed necessary in order to improve student test scores on state-mandated tests. Values may be included within the formal curriculum as overt objectives such as “The learner will appreciate narrative poetry.” Or values may be inferred from what is included and excluded from the formal curriculum. Sociologists may view the formal curriculum as a purveyor of the dominant culture and vital to instilling the habits of good citizenship however those are defined.

## FOUCAULDIAN THOUGHT

---

Foucauldian thought in curriculum studies attends to the idea that human understanding is shaped by the systems of ideas available during a particular historical period. Central to his work, Michel Foucault offers critiques of representations of the human subject as (a) possessing a consciousness that is transparent to itself, or (b) possessing the ability to observe and evaluate historical and contemporary events from outside systems of thought characteristic of a period. The phrase has taken on contemporary significance for enabling curriculum scholars to develop theories of resistance and trouble Enlightenment notions of reason and logic. More recent, Foucauldian thought has been helpful for studying issues of control and freedom as they relate to government policy on educational research and officially sanctioned perspectives on

teaching and learning. The following explores three registers of Foucauldian thought that have been influential within curriculum studies.

With his articulation of archeology, Foucault offered curriculum studies a compelling method of discourse analysis. More specifically, Foucault provides scholars with an alternate understanding of historical truth. He eschews a progressive, singular, and linear narrative of history in the search for a more expansive and disjunctive approach to historical understanding that attends to infinite microstories, each with unique relationships on multiple levels with the contingencies of their past and future. Of key importance within Foucauldian thought, each of these microstories has a tangible existence in historical and contemporary texts, which can be analyzed. Within curriculum studies, Foucault’s discourse analysis challenged the possibility of a total or complete history of curriculum concepts—that is, it challenged a conception of curriculum history where it is possible to capture an essential or universal essence of prior periods. Instead, what Foucauldian thought has provided curriculum studies is a method for the study of general, but not universal, history, one where within textual analysis no continuities can be assumed. For curriculum studies, as an interdisciplinary field, Foucault’s archeology has had major ramifications. Curriculum scholars might no longer posit similar histories within each of the subdomains of the field; rather, the emphasis is more on heterogeneous forms of relationships. Similarly, with the emphasis on discourse and documents there is less attention toward the decisions and actions of curriculum figures than to the movement of material. Moreover, with the rejection of large-scale theories about teaching and learning, Foucauldian thought sparked attention to breaks, ruptures, and shifts in the limits of curriculum thought rather than toward continuities.

In addition to archeology, Foucault’s concept of biopower has been influential within the curriculum field. For Foucault, biopower contrasts with premodern modes of power, which are based in the threat of death from a rule making authority. In modern societies where authority must be grounded in reason, biopower focuses upon protecting life through the regulation of the body instead of employing intimidation or threats to secure acquiescence. Transferring the concept to

the scene of curriculum studies, education scholars have employed biopower to study the regulatory force of government by way of education, as well as the use of state power to promote well-being and health within different populations through inculcating certain habits and customs. Most important, as Foucault developed the concept, his notion of power is neutral in contrast to negative conceptions that had come before it, ones where force was used to thwart activity or thought. Therefore, when curriculum scholars extend Foucault's explication of biopower, which is placed in the service of maximizing life, they examine its productive capacities. They also attend to its dark side, one that becomes possible because within its logic a broad range of practices might be justified. These actions include the eradication of bodies of knowledge and populations of people because they are deemed a threat toward the life of a nation or humanity as a whole.

Finally, Foucault's focus upon processes of subjectification has been taken up repeatedly within the curriculum field. In contrast to theories that focus on voice and self-awareness, curriculum scholars have employed Foucauldian thought to highlight the ways in which the ability to speak is bounded by the discourses through which human subjectivities are constructed—that is, while the subjects of education might choose different discourses and attempt different tactics for making meaning, these choices are never the product of selves that can stand outside of history, culture, and language. Because subjects are positioned inside all three, curriculum scholars who employ Foucauldian thought focus upon the ways in which the researcher and researched alike are unfree to the extent that the statements they make are mediated by institutionally shaped linguistic customs that are never completely their own. This understanding does not mean that curriculum scholars employing Foucauldian thought assume that there is no space for resistance and freedom. On the contrary, although positions out of which to think and speak are shaped by the discourses that temporally and ontologically come before human subjects, the variety of those discourses produces both hegemonic and counterhegemonic positions that human subjects might come to occupy.

Foucauldian thought has in the past and will continue in the future to play a paramount role in

curriculum studies. Foucault unsettled many educators with his assertion that humans were neither fully independent nor fully rational subjects with capacities to exist beyond the forces of history. Instead, he portrayed human subjects as formations of the language and ideas available within the moments where lives take place. This does not mean Foucauldian thought should be interpreted as pessimistic. What is most useful in Foucault includes his analysis of the contested character of domination, his commitment to human freedom, and his assertion that power is not just repressive, but also productive. Most importantly, Foucauldian thought has provided at least three important lenses for examining educational issues.

## FRAMES OF MIND

---

In 1983, Howard Gardner, a Harvard University professor, authored *Frames of Mind: The Theory of Multiple Intelligences* and introduced his theory of multiple intelligence (also called MI theory) by initially identifying seven types of intelligence: linguistic intelligence, musical intelligence, logical-mathematical intelligence, spatial intelligence, bodily-kinesthetic intelligence, interpersonal intelligence, and intrapersonal intelligence. In 1999, he noted three additional intelligences—naturalist, spiritual, and existential intelligence.

Gardner's theory of multiple intelligence challenged traditional beliefs that intelligence is one

single construct, thus providing educators new ways of thinking about curriculum content and delivery as related to the intelligences. Curriculum based on the MI theory allows educators to promote students' success by focusing on students' unique intelligences and by developing those less prominent.

The nine intelligences in MI theory that can be incorporated into the curriculum as specific instructional strategies are as follows:

1. *Linguistic intelligence* involves the ability to effectively learn and use both spoken and written language to accomplish specific goals, including the ability to follow the rules of grammar, retain and recall the information, use language to express oneself rhetorically or poetically, and to communicate appropriately.

2. *Musical intelligence* refers to competence in the performance, composition, and appreciation of music and involves the capacity to sense, recognize, and compose musical pitches, tones, and rhythms.

3. *Logical-mathematical intelligence* encompasses the capacity to calculate accurately, reason deductively, and analyze problems logically, abstractly, and scientifically. Engineers, scientists, economists, accountants, lawyers, and detectives are among those who have high logical-mathematical intelligence.

4. *Spatial intelligence* relates to the recognition, use, and manipulation of patterns in small and large spaces. Artists, architects, sculptors, sailors, photographers, interior decorators, and strategic planners display spatial intelligence.

5. *Bodily-kinesthetic intelligence* consists of the capacities to control the motions of one's body or parts of the body and to manipulate objects in highly skilled ways. It is the ability to skillfully coordinate mental activity with physical motion. Athletes, dancers, performers, instrumentalists, and surgeons show highly evolved bodily-kinesthetic intelligence.

6. *Interpersonal intelligence* entails the capacities to understand the intentions, motivations, and desires of other people and to interact effectively with

others. Political and religious leaders, social workers, teachers, psychologists, and therapists may have such intelligence.

7. *Intrapersonal intelligence* involves the ability to understand oneself, including one's own emotions, desires, and fears and to be able to make effective use of this information to regulate one's own life. Some psychologists, therapists, counselors, and novelists may foreground the talent.

8. *Naturalist intelligence* involves the keen awareness of how to recognize, classify, and distinguish diverse plants, minerals, and/or animals in natural surroundings. Naturalist intelligence may include the ability to recognize artifacts in different cultures and historical periods.

9. *Existential intelligence* is the ability to locate oneself with respect to existential features of the human condition, the significance of life, the meaning of death, the ultimate fate of the physical and the psychological worlds, and experiences such as love of people or immersion in art.

According to Gardner, individuals generally possess more than one of the nine intelligences. He emphasized the importance of a varied or personalized curriculum aligned with learning strategies addressing multiple intelligences in order to enhance and develop students' particular intelligences. Acknowledging and addressing students' intelligences can motivate success. In addition, recognizing the intelligence types of each student and being aware of the different learning strategies related to the intelligences can aid teachers and counselors in developing curriculum to assist students in (a) setting personal goals, (b) identifying their own learning potential, and (c) developing personal curiosity and creativity. Considering the MI theory, teachers are able to develop and deliver curriculum aimed at assisting students to attain their full potential.

## FRAMEWORKS IN CURRICULUM DEVELOPMENT

---

A curriculum framework is a subject-specific document that presents parameters to assist in the development of a curriculum and identifies learning outcomes for what schoolchildren are expected to know and be able to do as they relate to the knowledge and skills of a particular discipline. It provides direction to local districts and schools as they develop their curricula.

A framework is not a curriculum guide nor is it designed to be used as an instrument for the delivery of instruction. It can be used as a major resource for the development of regional or schools' curricula, instruction, and performance assessments and for professional development. Standards of achievement for subject areas are generally included in curriculum frameworks. Thus, curriculum frameworks provide the basis for teaching, learning, and assessing in a particular subject area or course. They also provide a framework for further development and implementation in areas such as student evaluation, staff development, and learning resources. They are developed to initiate discussions concerning curriculum integration within and across classrooms. Each subject-specific curriculum framework mainly includes an overview of student learning outcomes for each grade.

There are numerous approaches to frameworks for curriculum development. From a technical perspective, frameworks that identify procedures to develop curriculum include Ralph Tyler's Tyler Rationale, Hilda Taba's seven steps, Decker Walker's naturalistic model, Elliot Eisner's artistic approach, and Grant Wiggins and Jay McTighe's backward design as just a few commonly mentioned models.

These approaches simply provide teachers, researchers, curriculum specialists, policy makers, and school administrators with methods of studying and researching fundamental questions of curriculum development and research.

Tyler's model, nevertheless, may be the most widely recognized. Tyler proposes four basic frameworks for curriculum development, including purpose(s) of the school, educational experiences related to purposes, organization of experiences, and evaluation of purposes. Following Tyler, Taba developed a more complex model that elaborates Tyler's four principles and expands them to seven components: rationale, aims, content selection, content organization, learning experience selection, learning experience organization, and evaluation. The frameworks of curriculum design, as outlined by Tyler and Taba, propose that the curriculum development effort should be guided by information gained from industry, the students, educators, and society as a whole.

Curriculum frameworks give teachers a common starting point for what students should learn about the subject covered. The frameworks offer a basic structure for how and what to teach in education programs. They describe the components with which each program and teacher can design a curriculum that is relevant to the needs of a particular group of learners. They suggest examples of hands-on, real-world activities and classroom performance assessments.

The development of curriculum frameworks includes the revision of subject matters, evaluation of course content, and the development of new programs and courses that more closely reflect individual and societal needs and contemporary workforce requirements. The performance standards included within a curriculum framework aim to help ensure ease in a student's transition to another grade in his or her program.

## FREEDOM SCHOOLS

---

The original Freedom Schools were organized by the Student Nonviolent Coordinating Committee (SNCC). Beginning in 1961, SNCC worked to get Black Mississippians registered to vote, but they faced overwhelming opposition from state and local authorities. Mississippi was the most segregated state in the nation, and many people believed that the state would never change as long as it remained isolated from the rest of the United States.

To focus the nation's attention on Mississippi, SNCC organized Freedom Summer in 1964. Hundreds of volunteer college students, White and Black, came to Mississippi from all over the country. Many of these volunteers served as teachers in Freedom Schools, which were a major part of the summer program. SNCC activists established the Freedom Schools because they believed in the power of education to change people and to transform communities. The main goal of education according to the Freedom School model was to encourage students to question the system of oppression that kept them poor and isolated and to enable folks to think for themselves so that they could change their own lives.

The original "Prospectus for a Summer Freedom School Program," written by Charlie Cobb in 1963, claimed that while the Black children of Mississippi were deprived of many things, the fundamental injury was a complete absence of academic freedom with students forced to live in an environment geared to squashing intellectual curiosity and different thinking. Cobb concluded that if the movement wanted to break the power structure of the Old South, it must be concerned with creating counterinstitutions to stand in opposition to and one day even replace the old, unjust, decadent ones that made up the existing power structure.

SNCC organizers argued that all education is political, that there is no such thing as a neutral education. Education stands for something and against something else. SNCC was educating for the uprooting of an oppressive system, and they said so explicitly.

The Freedom School curriculum included an academic component as well as arts, recreation, and cultural activities, but the core was what they called the citizenship curriculum, a sustained inquiry into politics and society. In the published version, the academic part takes 2 pages, the citizenship section 25 pages.

The citizenship curriculum is a question-asking, problem-posing affair: (a) Why are we (teachers, students) in Freedom Schools? (b) What is the freedom movement? and (c) What alternatives does the freedom movement offer us?

These were called the basic set of questions, followed by a secondary set: (a) What does the majority culture have that we want? (b) What does the majority culture have that we do not want? and (c) What do we have that we want to keep? Note the use of *we* in this context—this is consciously intended to build a sense of solidarity, a need for systemic change, and to oppose the notion that individual achievement and private accumulation are by themselves worthy goals.

The 1964 Freedom School curriculum was based on dialogue—teachers listened, asked questions, assumed that their students were the real experts on their own lives: Why? What's the problem? What's the evidence? How do you know? Is that fair or right? What are you going to do about it? It was a pedagogy of lived experience with the goal of allowing people to collectively question and then challenge their life circumstances and situations.

The problems we face today are unique in some ways, but perhaps we can learn from the stance of the movement as it encouraged students (including community members) to come together to identify obstacles to their full humanity, to examine the world—social, political, cultural, historical, and even economic dimensions—to name those aspects in need of repair, and to mobilize to act on behalf of what their newfound knowledge required.

## FREIRE, PAULO

---

Paulo Freire (1921–1997) reconstructed what it meant to be an educator and through his work helped to establish new forms of research and practices in the field of curriculum studies. Freire convincingly argued that educators cannot be viewed as technicians, functionaries carrying out the instructions of others. Teachers in the Freirean sense are learned scholars, community researchers, moral agents, philosophers, cultural workers, and political insurgents. Freire maintained that teaching was a political act and that educators should embrace this dimension of their work and should position social, cultural, economic, political, and philosophical critiques of dominant power at the heart of the curriculum. His notion of critical praxis, characterized as informed action, demanded curricular and instructional strategies that produced not only better learning climates, but also a better society. Called the inaugural philosopher of critical pedagogy, Freire's writings have redefined and refocused our basic beliefs of the purposes of education.

Freire was born in the north of Brazil in 1921. He learned about poverty and oppression through the lives of the impoverished peasants around whom he lived. As a lawyer, a teacher, the education minister

of São Paulo, and a scholar, he constructed a devotion to work that would improve the lives of these marginalized people. Freire became one of the most well-known educators in the world by the 1970s. His work with the Brazilian poor was viewed as dangerous and subversive by wealthy citizens and the Brazilian military. When the military overthrew the reform government of the country in April of 1964, progressive activities were shut down and Freire was jailed for his insurgent teaching. After serving a 70-day jail term, Freire was deported. He continued his pedagogical work in Chile and later under the auspices of the World Council of Churches throughout the world.

To help students develop wider conceptual lenses to view their lives and social situation, Freire developed what he called codifications—pictures and photographs as part of a research process directed at the students' social, cultural, political, and economic environment. The pictures in this codification process depicted problems and contradictions in the lived worlds of students. Freire induced the students to step back from these pictures, to think about what they told them about their lives. What are the unseen forces and structures that are at work in these images, covertly shaping what is going on in the areas they depict? In this context, students began to see their lives and the hardships they suffered in a new way. They began to understand that the way things presently operated was not the only option available. The possibility for positive change embedded in this understanding is the key to Freire's educational success. Students were motivated to gain literacy in order to take part in changing both their own lives and the society. The process of learning was inseparable from individual empowerment and social change. They could not achieve the goals they sought without knowing how to read and write. Because the dominant classes did not want students from the peasant class to succeed with their academic studies, Freire's students knew that they had to excel in their studies to overcome the oppressors.

Such experiences helped Freire understand the ways that schooling was often used by dominant interests to validate their own privilege while certifying the inferiority of students marginalized by social and economic factors. Understanding schools

as impediments to the education of the poor, Freire sought numerous ways for students to intervene in this dehumanizing process. Freire referred to this process of intervention as liberatory action. Liberation in the Freirean articulation requires more than a shift of consciousness or an inward change. Freire argued that liberation takes place in the action of human beings operating in the world to overcome oppression. There is nothing easy about this process, he warned his readers. Liberation never completely ends, as oppression continuously mutates and morphs into unprecedented forms in new epochs. Freirean liberation is a social dynamic that involves working with and engaging other people in a power-conscious process.

Social change in the context of liberation and emancipation, according to Freire, is possible. Because the world has been constructed by human beings, it can be reconstructed by human beings. Nothing human made is intractable, and because this is so, hope exists. In this domain of hope, Freire brought the belief to his students that in the framework of this historical hope we can learn together in the here and now.

One of the most important dimensions of Freire's pedagogy involved the cultivation of a critical consciousness. Liberation cannot be attained until students and teachers address the nature of a naïve consciousness and the maneuvers involved in moving from a naïve to a critical consciousness. To make this move, individuals need to understand reality as a process rather than as a static entity. In this process-oriented mode, teachers and students begin to understand historically how what is came to be. Teachers and students can begin to imagine ways that release the future from the dictates of the past. They develop a consciousness that imagines a future that refuses to be normalized and well behaved. For the naïve thinker, education involves molding oneself and others to this normalized past. For the critically conscious thinker, education involves engaging in the continuous improvement and transformation of self and reality.

The oppressed, Freire frequently wrote, have been so inundated by the ideologies of their oppressors that they have come to see the world and themselves through the oppressors' eyes. Exposure to oppression often opens the eyes of the oppressed to its nature, but it can also distort one's self-perceptions

and interpersonal interactions. In such a context critical consciousness is elusive because the oppressed are blinded to the myths of dominant power—the ones that oppress them and keep them in their place. Essentializing myths about groups of people must be confronted. Such confrontation and the insights that emerge in the process constitute what Freire labels conscientization—the act of coming to critical consciousness. In this movement from naïveté to criticality, individuals grasp the social, political, economic, and cultural contradictions that subvert learning. Teachers and students with a critical consciousness conceptually pull back from their lived reality to gain new vantage points. They return to the complex processes of living critically and engaging the world in the ways such a consciousness requires.

All teachers should respect the experiences of the oppressed—but they should never take them simply as they are. Freire asked how ideology and other forms of power shaped the identity and experiences of the oppressed. Identity is always in process, it is never finalized, and it should not be treated as something beyond the possibility of change. Freire makes a pedagogical argument that has often been missed by many. Understanding the student's being and experiences opens up the possibility for the teacher to initiate dialogues designed to synthesize his or her systematized knowing with the minimally systematized knowing of the learner.

Freire argues that the teacher presents the student with knowledge that may change the learner's identity. Freire emphasizes the directive status of the teacher. He contends that the authority of the teacher is based on the knowledge and insight brought to class. Freirean authority exists not simply because she or he is the teacher, but because of what she or he has to offer the students. In this pedagogical context, Freire injects his concept of literacy. The ability to use the printed word is essential to Freire's effort to reshape the world. As students become literate, they are empowered to change themselves and to take action in the world. As they read the word and the world, students read their reality and write their lives. Such reading by itself, Freire warned, is of little use if not accompanied by transformative action for justice and equality. Today, one can find Freire literacy programs

around the world. Freire positioned literacy as a way of life where one used one's reading and writing skills as tools to care for other people. This critical notion of literacy as a way of life and the larger concept of education as a political act must not be lost in efforts to implement Freire's work.

Some teachers attempt to depoliticize his work in ways that make it simply an amalgam of student-directed classroom projects. Other teachers have emphasized the political dimensions, but have ignored the rigorous scholarly work that he proposed. These latter efforts have resulted in a social activism devoid of analytic and theoretical sophistication. Academic work that cultivates the intellect and demands sophisticated analysis is deemed irrelevant in these anti-intellectual articulations of Freire's ideas. The struggle to implement a Freirean critical pedagogy should never seek some form of purity of Freirean intent. Freire insisted that we critique him and improve upon his ideas. Living up to many of his pedagogical principles without sanctifying and canonizing him and his work is a conceptual tightrope that we must walk. Few have embodied the impassioned spirit as intensely as Freire did in his pedagogy.

## FREUDIAN THOUGHT

---

The concept of education—its dangers and promises and its illusions and revelations—is elaborated throughout Sigmund Freud's (1856–1939) great

corpus of 24 volumes on studies of psychoanalysis. Known in English as *The Standard Edition* (1886–1940), Freud's clinical and theoretical writing represents the human through its lifelong controversies in learning to live: as vacillating between the demands of fantasy and reality; as an internally divided, erotic, finite creature; as unconsciously affected by its infantile history of helplessness and dependency; as an amalgam and expression of group psychology and its conflicted, intersubjective design; and as suffering from both meaning and its absence or loss. Given the conflicted nature of the human, Freudian thought focuses on the limitations of cognition with the translation of the dynamic unconscious into speech, desire, and perception. The psychoanalytic curriculum study of education, then, refers to our emotional attitudes toward knowledge and our own otherness.

*The Standard Edition* contains Freud's clinical case studies; theory and technique papers; general lectures; commentary on war, trauma, emotional suffering, and death; analysis of dreams, art, literature, and the imagination; writings on sexuality, the family, and the drive to know; and speculations on the formative structures of Eros (the drive of unity) and Thanatos (the drive of destruction) in sexuality and mass psychology. These volumes are the curriculum of psychoanalysis and serve the psychoanalyst's didactic education. The work of Anna Freud (1885–1982), along with her students, Erik Erikson and Peter Blos, the British School of Object Relations led by Melanie Klein (1882–1960), and the work of Bruno Bettelheim in reading and affects, for example, have influenced the progressive curriculum of teacher education, educational psychology, and the design of literacy education. All of these theorists consider learning as a problem of imagination, creativity, freedom, symbolization, and the capacity to tolerate their intrinsic frustrations.

Freudian thought represents the mind through its psychological agencies, a metapsychology of the unconscious (the id), the ego (the I), and the super-ego (the super I). The dynamics, or movement, of psyche and soma are described and treated as emerging from early caregiving, as experiences of reality and fantasy, and as composing wishes, anxieties, and defenses. This approach gives to curriculum studies the following questions: What

holds together and what breaks apart the emotional, social, cultural, and political world of the learner? What is the role of the other in self-constitution? What happens to knowledge if the human is considered as conflicted, as creative in its dream world, as organized through the pleasure and unpleasure principles, and as affected by unconscious forces he or she knows nothing about? What role does the past play as it is transferred to present relations of authority and knowledge? What is the relation between sexuality and thinking? And what becomes of the afterlife of unresolved conflict in relation to how we attach to or dissociate from ideas, other people, and modes of self-perception and presentation?

At least five affective dimensions of curriculum studies can be identified with Freudian thought: conflicts with the child's sexual theories and gendered development; scenes of the child's and teacher's theories of reality, history, and fantasy; problems of education as a moral force; tensions in sublimating instinctual aggression and the pleasure principle; and contradictions education gives to psychoanalytic thought. In each dimension, Freudian thought proposes the qualities of education as an asymmetrical human relation made from love and hate, as creating psychical consequences beyond the conscious and willful efforts and intentions of everyone involved, and as experience with the uncertainty of meaning.

In its attempt to instill enlightenment, the curriculum of education gambles with individual and institutional neurosis, fear of failure, and traumatic repetitions. A Freudian analysis of curriculum studies interprets anxiety and defense through fantasies of knowledge, breakdowns of meaning, and modes of address in self-other relations. It highlights the emotional scenery of affective experiences such as compliance, discontinuity, resistance, and freedom. It is curious about what education feels like. With the Freudian idea of ego defenses and resistance to knowledge, a curriculum study is understood through its own breakdown and repair. Freudian thought proposes a significant paradox: There can be no learning without conflict and difference, and yet both incur anxiety. Too much anxiety will attack the capacity to think; not enough anxiety will stop the desire to think. What links Freudian thought to curriculum studies is its method for creating a

new understanding of the centrality and uses of conflict in learning.

## FUNDAMENTAL CURRICULUM QUESTIONS, THE 26TH NSSE YEARBOOK

---

The 26th Yearbook of the National Society for the Study of Education (NSSE), *The Foundations and Technique of Curriculum-Construction*, has taken on legendary dimensions for the field of curriculum studies. Although folklore states that the field of curriculum began in the United States 1918 with the publication of the first U.S. book (by Franklin Bobbitt) with the title curriculum, the NSSE yearbook committee was brought together to conceive some semblance of theoretical constructs for curriculum development and in so doing, to establish a distinct academic field. This it did by presenting a historical review and a description and evaluation of contemporary practices; the yearbook authors then forged a statement of foundational principles for curriculum reconstruction. Published in two parts (at 685 pages in total), Part I, *Curriculum-Making: Past and Present*, sought to describe and critically synthesize curriculum making, past and present. Part II, *The Foundations of Curriculum-Making*, presented a joint platform for curriculum construction and the reconstruction of the school curriculum. The original

Committee on Curriculum-Making was composed of 12 leading professors of education with 20 associated contributors who were school administrators and teachers. Part I, actually released in 1926, was published for discussion at the NSSE's 1927 Dallas meeting. Harold Rugg, who served as the general coordinator of the yearbook committee, viewed the group as attempting to establish a fundamental orientation in curriculum construction from many divergent and ideologically contrasting perspectives.

The 26th NSSE yearbook is best known in curriculum studies for the second portion of the publication, Part II, which contains a composite 18-page statement, *The Foundations of Curriculum Making*, with 58 individual planks composed by the committee of 12 authors: William C. Bagley, Bobbitt, Frederick G. Bonser, W. W. Charters, George S. Counts, Stuart A. Curtis, Ernest Horn, Charles H. Judd, Frederick J. Kelly, William H. Kilpatrick, Rugg, and George Works. These statements arise in response to a series of questions posed by the group. Rugg expressed concern that the publication of a general statement could cause the reader to accept the principles blindly when in fact the committee members wished to portray their hard thinking about the issues and problems of curriculum construction. Thus, the subsequent chapters in Part II are interpretations and rejoinders either as supplementary statements or as critiques to specific aspects of the platform. If any occasion in the history of education could be identified as an effort to forge unity and to synthesize a conception of curriculum, Part II of the yearbook, released in 1930, would have been that moment. Yet reflecting in 1947 about the 26th NSSE yearbook, Rugg maintained that the most important achievement and most lasting influence of *The Foundations and Technique of Curriculum-Construction*, what he called the beginning of the new day, represented the committee's society-centered emphasis for curriculum making that, he maintained, was the launching of educational foundations.

The Committee on Curriculum-Making, in Part II, *The Foundations and Technique of Curriculum-Construction*, posed 17 fundamental questions:

1. What period of life does schooling primarily contemplate as its end?
2. How can the curriculum prepare for effective participation in adult life?
3. Are curriculum makers of the schools obliged to formulate a point of view concerning the merits or deficiencies of U.S. civilization?
4. Should the school be regarded as a conscious agency for social improvement?
5. How shall the content of the curriculum be conceived and stated?
6. What is the place and function of subject matter in the educative process?
7. What portion of education should be classified as general, and what portion as specialized or vocational or purely optional?
8. Is the curriculum to be made in advance?
9. To what extent is the organization of the subject matter a matter of pupil thinking and construction or planning by the professional curriculum maker as a result of experimentation?
10. From the point of view of the educator, when has learning taken place?
11. To what extent should traits be learned in their natural setting?
12. To what degree should the curriculum provide for individual differences?
13. What should be the form and organization of the curriculum?
14. What, if any, use shall be made of the spontaneous interests of children?
15. For the determination of what types of materials should the curriculum maker analyze the activities in which adults actually engage?
16. How far shall methods of learning be standardized?
17. What are the administrative questions of curriculum making?

In an effort to display the timeless quality of this publication as well as to underscore its profound ability to generate thoughtful conversation and insight, the editor of the *Encyclopedia of Curriculum Studies* invited two curriculum scholars to address each of these questions from a contemporary perspective. These entries

appear in the encyclopedia's appendix: Fundamental Curriculum Questions.

## FUNDAMENTALS OF CURRICULUM DEVELOPMENT

---

First published in 1950 and then revised in 1957, the synoptic curriculum text, *Fundamentals of Curriculum Development*, by B. Othanel Smith, William O. Stanley, and J. Harlan Shores set the standard for synoptic texts of the 1950s. The conceptualization provided by these authors influenced scholarship on curriculum development for the 1950s, the 1960s, and well into the 1970s. It was influenced by earlier texts by Franklin Bobbitt, W. W. Charters, Henry Harap, L. Thomas Hopkins, and Alice Miel and especially by synoptic texts by Hollis Caswell and Doak Campbell, Harold Alberty, and Florence Stratemeyer (and colleagues). It influenced synoptic texts for at least four decades by many authors, including J. Galen Saylor and William M. Alexander, Hilda Taba, Daniel and Laurel Tanner, Elliot W. Eisner, and William H. Schubert. In addition, it elaborated greatly on the highly influential, succinct, empirical-analytic framework outlined by Ralph W. Tyler.

Growing from a breadth and depth of involvement in social foundations of education, Smith, Stanley, and Shores christened the first section of their treatise as social diagnosis as a salient prerequisite body of knowledge for curriculum development. This body included understanding meanings and structures of culture and cultural change. Derived from roots in the philosophy of John

Dewey, they showed that meaningful curriculum development must be situated in community change. Although this involved a grassroots perspective, they also argued that curriculum development must be seen simultaneously in terms of large-scale societal values. Thus, curriculum development was held to be a social process needing extensive social perspective.

The second and third sections of *Fundamentals of Curriculum Development* related closely to the analytic framework of principles of curriculum and instruction that Tyler devised in 1949: purposes, selection of content or learning experiences, and organization. In doing so, they analyzed principles for the validation of objectives (i.e., social adequacy, human needs, democratic ideals, consistency and noncontradiction, and behavioristic interpretation). These were treated as criteria for the selection of values. They expanded the use of criteria and principles to subject matter selection and differentiated carefully among four procedures of determining selection: judgmental, experiential, analytical, and consensual. Principles, criteria, and procedures were carried into considerations of sequence and course placement, as well as allotment and distribution of instructional time. Four major patterns of curriculum that vied for supremacy in the 1950s, as well as before and after, were elaborated in terms of chief characteristics, problems, practices, and criticisms: the subject curriculum, the activity curriculum, and the core curriculum.

Part 4 introduced a new consideration seldom treated in curriculum development before, except by Miel in the late 1940s and early 1950s: human relations. Under this topic such subtopics as educational engineering, curriculum change, and action research were introduced systematically. Much was built upon change theory of field psychologist Kurt Lewin and his method of considering gatekeepers vis-à-vis change and the use of force field analysis to deal with supportive and resistive forces in a situation to be changed. Substantial emphasis in this process was devoted to personnel, school-community relations, faculty morale, and their place in selecting, initiating, and sustaining change.

The final section of the book, Part 5, dealt with theoretical curriculum issues: sources of authority; the relative importance of individual and social

dimensions in considering educational objectives; the social, citizenship, or reconstructive functions of curriculum; sociological and nonsociological (e.g., religion, rationality, preservation or reconstruction of the social order) theories as criteria of content emphasis; and issues concerning the teaching of social problems in view of participatory democracy, perpetuation of social heritage, and reconstruction relative to controversial issues.

*Fundamentals of Curriculum Development* was thus an exemplary and comprehensive treatment of curriculum development that expanded and contextualized topics and principles streamlined in the Tyler Rationale. The emphasis on theoretical perspective, alternative criteria, and cultural context broadened and deepened understanding needed for curriculum development and opened windows that eventually enabled the move to

emphasis on understanding in the later realm of curriculum studies.

## GAY RESEARCH

---

Gay research is a broad umbrella term within curriculum studies for multiple approaches to the study of sexuality issues. The term has its origins in the realm of psychology, particularly the psychology of sexual identity and practice. Researchers of the history of sexuality have illustrated, for example, that prior to the 20th century both heterosexual and homosexual desire were considered aberrant; only sex for procreation was acceptable. By the 1930s and 1940s, contemporary definitions for both sexual orientations came into existence, with heterosexual desire reaching the status of normal and homosexual desire taking on its current contested mode. By the late 1940s, Alfred Kinsey, sexologist, both complicated and reaffirmed this sexual binary, developing a rating scale with six degrees of heterosexual-homosexual behavior and emotion. His research was groundbreaking for suggesting that most individuals possessed an interplay of both heterosexuality and homosexuality. Yet he also affirmed sexual orientation as divided between the two. By the 1970s, Fritz Klein, also a sexologist, attempted to expand upon Kinsey's work by way of a grid that incorporated seven variable components of sexual orientation and three different points in time (past, present, and ideal). Whereas Kinsey raised to the surface that an individual can hold both heterosexual and homosexual tendencies at the same time, Klein asserted that sexual orientation is made up of a myriad of factors, from emotional

and social preferences to lifestyle and self-identification, and that these variables can be different at different times.

Both Kinsey and Klein stressed that the division between homosexuality and heterosexuality is a product of culture and society, not nature. Their concern was that the naturalization of the social and historical division between gay and straight has had the larger effect of denigrating the former and elevating the latter. Even with their efforts, between the 1890s and 1960s, the terms homosexual and heterosexual made their way from the realm of psychology to mainstream culture, overtime making possible the construction of the sexually normal and abnormal citizen and the heterosexual majority and homosexual minority. The repercussions, researchers of gay and lesbian issues point out, has been the imposition of narrower possibilities for gender and sexual identity among citizens within modern societies. Therefore, the terms homosexual and heterosexual, or gay and straight, constructed new sex-differentiated ideals for inappropriate and appropriate desires, ones that were taken up and remade within the two communities in unique and often unforeseen ways, enabling and constraining forms of affection and identification.

Researchers of gay and lesbian issues in curriculum studies have worked out of this history to study sexuality and gender in relation to issues of teaching and learning. The remainder of this entry is focused upon how gay research has been taken up in ways that are unique to the field. These areas include curriculum development, agency among

gays and lesbians, externally imposed forms of marginalization and neglect, issues of discourse and language, policy concerns, and narratives of experiences in educational settings.

### Curriculum Development

Researchers of gay and lesbian issues in curriculum studies have been concerned with curriculum development. The rationale for incorporating gay and lesbian content within the curriculum has to do with attempts to decrease homophobic attitudes among students and prepare them to enter a sex and gender diverse world.

The most common curriculum development focuses upon influential gay and lesbian persons throughout history. The content highlights the positive contributions gay and lesbian people have made to various communities, from actors and artists to civil rights leaders and medical researchers. The aim of researchers of gay and lesbian issues is to study how challenges to representations of gays and lesbians as burdens to society change beliefs and attitudes among students.

Other curricula focus upon civil rights history and the struggle for social justice. In comparison to a focus on individual contributions, this curriculum content explores the efforts of social collectives to uphold equality for gays and lesbians, the most commonly referenced in the United States being the 1969 Stonewall Riots in New York City. The researcher of gay and lesbian issues studies how efforts at social equity impact students' understanding of democracy and history and their sense of apathy toward gay and lesbian people.

A third common perspective within curriculum development involves the reconceptualization of history. The focus is upon hidden events and perspectives not typically explored in conventional history curricula. These curricula offer evidence that historical figures commonly represented as heterosexual were in fact bisexual or gay or lesbian or that despite dominant representations gay and lesbian people existed throughout history. Researchers of gay and lesbian issues might study the extent to which revisionist histories unsettle students' conventional understandings of history, open them to alternate or hidden knowledge, and engender forms of critical consciousness or awareness.

### Agency Among Gays and Lesbians

Beyond curriculum development, researchers of gay and lesbian issues also study agency. In educational settings, gay and lesbian people have had their histories erased and affective interests denied, disparaged, and reduced to sex acts. Accordingly, they experience harassment and discrimination at a much higher rate than those who identify as heterosexual. Their precarious positions have been used as evidence of the inability of gay and lesbian people to perform to the heterosexual ideal, one that includes the replication of traditional gender roles, relationship and family patterns, and status positions within society.

Instead of highlighting the conditions that shaped both heterosexual and gay and lesbian lives, those who are unaware of the cultural facets of gay and lesbian research often subjugate same gender loving people and their concordant knowledge—that is, they construct gender and sexuality differences as the result of pathologies assumed to be innate to gay and lesbian peoples and not because people positioned as different in time and space experience increased harassment and discrimination. Accordingly, rather than focus upon gay and lesbian people as deficient or as lacking, researchers of gay and lesbian issues within curriculum studies focused on agency have examined how same gender loving people persevere in spite of culturally oppressive practices. This research has focused upon gay and lesbian experiences with developing supportive and nurturing relationships in environments that range from tolerant to hostile. It has also attended to the efforts of gay and lesbian people to craft both formal and informal collectives through which to self-identify and enact broader change, such as the gay-straight alliances that have been formed at public schools across the United States. Finally, this research has attended to educational programming and outreach efforts by gay and lesbian people, along with their allies, to teach about sexuality and identity issues, discrimination against gay and lesbian people, and lived histories coming to terms with one's own same gender attractions. Most importantly, agency within research on gay and lesbian issues has worked as a counterforce to research that positions gay and lesbian people as merely victims and stereotyping that occurs in the absence of alternate knowledge.

### Externally Imposed Oppression

On the opposing side of agency, researchers of gay and lesbian issues in curriculum studies also study victimization or externally imposed oppression. They note that being perceived as a gay or lesbian brings with it a higher probability that one will become the target of violence, from verbal assault to vandalism or arson. They also study gay and lesbian identity development, including the age at which adolescents typically reveal their sexual orientation to others, the ways in which they cope with oppressive systems and people, and how experiences with being gay or lesbian compare across generations. Given the focus on oppression, this research attends to factors that negatively affect gays' and lesbians' development, particularly their self-esteem and positive identity so that they might be addressed. Anticipating social conflicts or fearing victimization, researchers of gay and lesbian issues note that same gender loving students often hide their sexual orientation or lead a double life rather than confront peer, family, and social situations that are threatening. Research on oppression suggests fear of being discovered can lead to denial of one's sexual orientation and inhibit healthy identity development. The resulting alienation puts gay and lesbian youth at risk for engaging in acts that are injurious to themselves, including risky sexual activities, and makes them more vulnerable to exploitation and harassment. Researchers who focus on studying distinctive life stresses due to externally imposed oppression have the goal of developing effective interventions for improving the lives of gays and lesbians.

### Discourse and Language Issues

Researchers of gay and lesbian issues in curriculum studies have also engaged in discourse analysis. This research challenges the commonsense notion that an idea is had prior to language and then finds expression through it. Researchers of gay and lesbian issues in curriculum studies focused on discourse analysis find problems with the belief that language is a neutral vehicle of expression outside the values, beliefs, and attitudes of a given society. Instead, discourse analysis assumes that language shapes the realm of possible thought and can be studied for its assumptions regarding sexuality and gender—that is, it can be studied to expose not only

dominant and subjugated relations within a given community at a particular point in time, but also what knowledge is considered essential or worthy and what is considered not worth knowing.

Researchers of gay and lesbian issues in curriculum studies who engage in discourse analysis examine the language used in various educational settings. These researchers have studied the discourse that surrounds prom in various communities for its heterosexist assumptions and also for how it has been challenged and contested.

Discourse analysis has also been used to examine the ways in which language erases the lives of gay and lesbian people through reductive, stereotypical representations and the failure to offer images of same gender loving people in nontypical locations, such as the rural South. Most important for research on gay and lesbian issues within curriculum studies, discourse analysis brings to the surface questions over how language reproduces the centrality of dominant groups around gender and sexuality and how language can be used to resist these dominant knowledge forms that result in oppression.

### Policy Concerns

For curriculum studies researchers exploring gay and lesbian issues from a macroperspective, policy is a key area of interest. These researchers commonly employ a systems perspective and share in a desire to better understand how procedures and processes shape the way gender and sexuality are given meaning in various educational settings. Such studies might investigate the ways sexuality and gender are regulated by way of educational standards and curriculum requirements, as well as by school sanctioned extracurricular activities. They might also examine the relationship between policy changes and improvements in school climate for gay and lesbian students or quite the opposite, the ways policy has deterred gay and lesbian students from reporting harassment and discrimination to school officials.

Equally revealing, researchers of gay and lesbian issues interested in policy issues focus upon two interlocking challenges. One set of policy studies is directed at interventions that help protect gay and lesbians from acts of intolerance. The other set of policy studies is directed toward

interventions that help educate heterosexually identified people about sexuality and identity. Research suggests this group must learn more about the diversity of sexual orientations, as evidenced in the work of Kinsey and Klein, and the vast differences in the ways that sexuality develops in humans. Regardless of the focus, curriculum studies researchers working from a systems perspective are interested in how policy can improve the life experiences of gay and lesbian people.

### Narratives

Possibly at the other end of the spectrum from the broad-range perspectives of policy researchers are those researchers that focus upon autobiography and narrative. These researchers commonly employ testimony and life history methodologies and hold a shared belief that storytelling and narrative studies are the most important sites for understanding how gender and sexuality are experienced and given meaning in various educational settings. Whereas policy studies examine how best to represent needs within guidelines for practice, those who focus on autobiography and narrative are more interested in self-understanding and reflection; they question the notion that policy can adequately represent the needs of another and instead focus on rich description and personal knowledge.

In relation to gender and sexuality issues, curriculum studies researchers assume that democratization of one's own mind is required prior to social reconstruction. These researchers might inquire into stories of coming out, first loves, or being openly gay or lesbian within various settings. Not concerned with replication or extending knowledge unchanged beyond its context, these scholars believe that autobiography and narrative can have a profound impact on how its readers view the world. In other words, for these researchers, storytelling can profoundly impact one's own knowing so that the world is viewed and understood differently. In this way, life history and testimony by gay and lesbian individuals can impact gay and lesbian and straight identified students and educators alike. Far from representation of others, curriculum studies researchers who engage in narrative and autobiography in their study of gay and lesbian issues focus upon authenticating lived experiences alongside the

shared experiences of learning about the lives of others.

### Future Directions

This entry is by no means exhaustive; there are other perspectives on gay research that are not included here. Researchers on gay and lesbian issues in curriculum studies have worked from foundations in psychology to challenge reductive representations of sexuality within contemporary society. Much like Kinsey, curriculum studies scholars have been concerned with the narrow ways sexuality has been imagined and its effects on those whose sexual identity is viewed as peripheral. Accordingly, they have conducted research that acts as a counterforce to knowledge that portrays gay and lesbian people as merely aberrant or abnormal, illustrating the complicated nature of sexual orientations and identity issues.

Unique to the field, curriculum studies researchers have taken up the study of sexuality issues in a myriad of areas that include curriculum development, agency among gays and lesbians, externally imposed forms of marginalization and neglect, issues of discourse and language, policy concerns, and narratives of experiences in educational settings. In the future it is imaginable that in each of these areas of research will be both extended and complicated. It remains to be seen whether curriculum studies will have the capacity to move more complex images of sexuality into the public sphere in ways that impact mainstream perceptions or whether they will find themselves following in the footsteps of Kinsey and Klein—that is, whether they will find themselves working to complicate gender and sexuality only to find that mainstream perspectives narrow or remain unchanged.

## GENDER RESEARCH

---

To understand what is taught and learned in schools, curriculum researchers must explore understandings of masculinity and femininity because they are interwoven with formal school subjects, sports and clubs, and discipline and authority. Gender has always been a dimension of schooling with some differentiation, and often segregation, of females and males common worldwide. Popular beliefs attribute differences between males and females to biology, but bodily processes are objects of social practice. Research has documented the mutability, socially constructedness, and historical specificity of what counts as male and female and as masculine and feminine. Schools are invoked in current assessments of gains toward and unfulfilled hopes of gender equality. Schools are now understood as places that produce gendered beings and understandings rather than just responding to preexisting differences in girls and boys. Masculinities and femininities are produced in schools in complex interactions with other accented differences, such as race/ethnicity, social class, sexual orientation, disability or ability, and language. Almost every aspect of schooling has been linked to gender: single-sex and coeducational practices, academics, sports, romance, and sexuality. Although gendered assumptions continue to be challenged and revised, their commonsense quality (we can see anatomical and behavioral differences between boys and girls!) makes them comfortable and comforting. And when we presume sharp differences between males and females, we are likely to see such distinctions. The durability of marked gender differences can be traced to their intertextual character—that is, the fact that narratives, language, emotions, and morality about

gender differences operate across many popular culture, political, economic, legal, religious, and family arenas of life. And many people, including researchers and educators, have investments in maintaining intelligible masculinities and femininities, which exhibit coherence among (biological) sex, gender, sexual practices, and desires.

### Theories

Gender researchers begin from different theories, outlooks, and assumptions that influence how gender is understood and studied, as well as how plans for change are made. Social constructionism is the most popular theoretical stance; in general, social constructionists theorize that there is an interaction between individual traits (biology, dispositions, and family upbringing, for example) and broader social norms and prevailing ideas of masculinity and femininity. There are more and less radical versions of social constructionism; more conservative versions hold that dominant masculinities and femininities will be quite similar in different historical and cultural contexts. More radical perspectives claim that gender arrangements vary enormously and inevitably across time and place and that there is, in fact, a coconstruction of the biological and the social. Coconstructionists argue, for example, that men's higher testosterone levels follow from social dominance as much as they precede it.

All social constructionists utilize some, however limited, conception of biological nature or essence. Alternatively, Judith Butler theorizes gender as performativity—stylized practices repeated over and over so they begin to appear to be a person's nature—and refuses any essentialism. This theoretical stance understands gender as produced through repetitive discourses and actions, which are grounded in the assumptions of heterosexuality. Performativity links sexuality and gender, while multicultural feminists have theorized intersections of gender and race, gender and class, and gender and nation.

The concept of assemblage has begun to make inroads on intersectionality as a way to critically theorize and study the ways race, class, culture, sexuality, and so on impact gender. Assemblage offers a more active, coming-into-being approach to these simultaneous processes. Intersectionality

fixes identities by emphasizing naming, representation, and meaning, while assemblage focuses on movements and privileges feeling, tactility, and information. In societies regulated by what Michel Foucault termed disciplinary norms, assemblages are critical conceptual tools to acknowledge and comprehend power in more fluid, textured, erratic, and unruly trajectories in order to become beyond what is known.

### Schools as Gendered Institutions

Schools invariably have a gendered character to their formal and informal operations. Schools' gendered character is visible when taken-for-granted aspects of schools are scrutinized, such as the division of labor (e.g., the ubiquity of male administrators and coaches and female English teachers), symbolic representations (e.g., sports achievements receive more attention and status than academic successes), normative concepts (e.g., correct student behavior, academic rigor, or a "good" teacher), and the subjective identities of teachers, students, and administrators (e.g., what range of identities and interests are recognized and valued). Therefore, thinking about gender and curriculum requires thinking about school effects at several levels.

For example, substantial research has focused on the gendered subjectivities of staff and students in coeducational and single-sex settings. Schools do not produce a simple dichotomization of males and females, but students, teachers, and administrators are characterized by multiple masculinities and femininities. There may be various well-defined sporting masculinities, techno-masculinities, eco-masculinities, and academic masculinities, as seen in the film *The History Boys*, which portrays a range of masculinities among teachers and students in a British prep school. Most U.S. high schools have identifiable student groups, each of which is likely to be connected to a particular style of masculinity and femininity: the athletes, the brains, the artsy crowd, the nerds, and the outsiders. Researchers claim that every school has a hegemonic masculinity, and males who embody the recognizable gender style have power over other boys and over girls. Similarly, schools will have a preeminent style of femininity with a higher status. Heterosexuality is also explicitly linked with higher

status identities; boys and girls who are attractive and successful with the opposite sex are inevitably popular and powerful. The lowest status students are generally those perceived to violate the compulsory heterosexuality of schools, for example, gay, lesbian, bisexual, or transsexual students, and young people with disabilities and those perceived as asexual can be included. Schools have been documented as hostile places for students who do not conform to the powerful dictates of hegemonic masculinity and compulsory heterosexuality.

Research on four arenas of school life—academics, sports, romance and sexuality, and media—provide detailed portraits of gender and schooling.

### Academics

Prior to 1972 and the passage of Title IX of the Education Amendments, which made gender discrimination in publicly funded U.S. school programs illegal, only 18% of U.S. women, compared to 26% of all men, had completed 4 or more years of college. Twenty-five years later, women made up the majority of students in U.S. colleges and universities in addition to making up the majority of recipients of master's degrees. In the first 25 years of Title IX, women's percentage of medical degrees increased from 9 to 38, and dental degrees increased from 1 to 38. Women's proportion of law degrees grew even faster, from 7% to 43%. These dramatic changes demonstrated a considerable move toward educational equity. Nevertheless, despite such improvements, ideas about male and female intellectual differences persist.

Narratives that boys and girls learn differently; have distinctive intellectual strengths, capacities, and interests; and have distinctive emotional processes remain entrenched in and out of schools. Specifically, men are believed to be more intelligent, evidenced by more male geniuses, and believed to have greater spatial and mathematical capacities. This research has been thoroughly critiqued by biologist Anne Fausto-Sterling, who demonstrated that the sex-differences findings are grounded on myths and researchers' preexisting beliefs about girls and boys' essential differences. Such research on learning and intellectual differences is flawed by its failure to utilize double-blind studies to control for researchers' expectations of differences between females and males. Competing

research findings claim greater variability in capacities among girls and among boys; however, the belief in and visibility of marked differences between males and females persists.

Global characterizations of chilly classrooms for girls and emotionally unsupportive teachers for boys have given way to more nuanced research conclusions, for example, that in some microenvironments, girls and boys have equality and in other contexts, males dominate. Research continues to document that teachers give boys more attention and more airtime in classrooms, and the actions, experiences, and perspectives of White men still dominate textbooks and curricular guides. In science, English, and social studies, boy-centered topics rule. Nevertheless, studies regularly find that teachers believe their teaching is free of gender, race, or ethnicity bias. This belief is part of the paradox of gender research—dynamics that are hypervisible to some commentators remain invisible to others. This paradox of research findings points to the ideological character of gender and gender research—that each person’s prediscursive assumptions and interpretations are significant and that gender research in curriculum is always political because it is linked with policies, practices, and budget allocations.

### *Sports*

One dramatic change wrought by Title IX was in girls’ participation in interscholastic sports: in 1971 girls were 7.5% of high school athletes, and 25 years later, they were 39%. This represented an eightfold increase, although girls’ sports often lag in prestige and fans. Nevertheless, taking to the field and court has been an important development and yardstick of gender equality, even though scholars debate what lessons are gained through competitive athletics. Despite women’s greater access to and achievement in sports, the production of high status masculinity is also still firmly grounded in sports, both of which are linked to sports’ international status and lucrateness.

Although sports have demonstrated a growth in opportunities for women, athletes now also challenge a simple, dichotomous gender categorization. The 2008 Beijing Olympics had a gender determination lab to test female athletes suspected of being male, using physical appearance and

blood samples to test hormones, genes, and chromosomes. In the past 40 years, dozens of female athletes have tested “positive” for maleness because many women have the Y chromosome. Transsexuals, who are allowed in Olympic competitions, likewise present an unintelligible gender identity. Because gender is more multifaceted and more elusive than the standard male–female dichotomy, a blood test will not capture the fluidity of gendered subjectivities.

### *Romance and Sexuality*

Research offers vivid portraits of schools as sites of (hetero)sexuality production. Some researchers refer to schools as heterosexualizing institutions, and studies demonstrate how romance and sexuality permeate literacy, corridors, bathrooms, and annual school rituals such as assemblies and dances. Elaborate prom activities and spending begin to approximate wedding planning and certainly eclipse academics. Even in elementary schools, pupils identify girlfriends and boyfriends and steadily move into flirting, going steady, and other trappings of heterosexuality. Sex education curriculum morphs into management of heterosexual romances. Much of this infusion of sexuality and romance in schools arrives via mass popular culture and advertising (see the following section).

Against this sexualizing tide, schools try to sanitize classrooms and remove bodies and sexuality from the formal curriculum. Although sexuality issues remain important in political, legal, and economic realms, talk of sexuality remains rare and discomfiting in formal school realms.

### *Mediated Mass Culture*

Although mass culture is not a structured part of schooling per se, mass cultural images and narratives saturate schools. Mass culture generates images and interpretations of masculinity and femininity that flow chaotically into school life and are reworked by the pupils through everyday conversation, ethnic tensions on the playground, sexual adventures, and so on. *South Park* and *The Simpsons*, for example, simultaneously invent new language styles, portray current social debates, and offer ironic interpretations of school and community lives.

The strong emotional and temporal involvements of young people in computer gaming and online social networking provoke unanswered questions about what youth learn and create in growing up vis-à-vis computers. Films, television, games, and the Internet offer commonsense and transgressive images and narratives of gendered subjectivities (in and out of school) and are productive sites for discussing, challenging, and perhaps, remaking gender.

### Curricular Interventions

Schools are prime places to interrogate and change conventional gender relations. However, changes move in various directions, and three distinct kinds of goals inform curricular innovations.

One goal is to provide girls and women with opportunities equal to those of boys and men. This standard for gender equality would aim to produce equal numbers of females and males with athletic scholarships, medical degrees, plumbing licenses, and congressional seats, for example. This set of aims is associated with liberal feminism and socialist or materialist feminists.

A second set of goals promotes the perspectives and ideas associated with femininity and female-centered associations. This aim supports the study of female philosophers, novelists, and thinkers, collaborative leadership styles, personal growth networks, and other traditionally female arenas of knowledge. This set of aims is most strongly associated with cultural feminism. This second approach has also been appropriated to promote men's reembracing of traditional masculinity emphasizing Christianity and family patriarchy.

A third approach aims to deconstruct male-female dichotomies, destabilize the assumed essences of masculinity and femininity, and muddy oppositional representations and epistemologies. This set of aims is affiliated with feminist poststructuralism and aims to display the arbitrary and partial character of gender typologies.

Once gender relations are understood as malleable, a rational process of improvement can be identified and implemented. This section reviews some educational initiatives to change unequal aspects of conventional masculinity and femininity.

A range of program enrichments has been directed toward girls. One attempt to address the

omissions in textbooks is to add special courses and units of study on women's history and literature. March is U.S. Women's History Month, and schools offer special educational events that often dovetail with February's Black History focus. Science and math teachers often supplement the textbooks with attention to women scientists and mathematicians. Computer courses have developed more social and girl-friendly projects. There has been a broad attempt to utilize feminine dialogic styles and collaboration in classrooms.

Along with supplementary knowledge in various subject areas, girls, especially from historically underresourced communities, have been offered programs intended to raise their self-esteem, develop goals and dreams, and provide support to achieve those goals. A range of nongovernmental organizations—Girl Scouts, Boys & Girls Clubs, International Rescue Committee—offer such programs, which combine high interest activities (dancing, poetry writing, tutoring) with emotional and psychological supports.

Criticisms of such additive approaches point out that girls and women are not homogeneous and that to identify certain styles of learning and topics as feminine is part of the problem. Furthermore, the piecemeal approach leaves conventional curricula and their narratives, assumptions, and dynamics unchallenged.

Reports of boys' underachievement in reading has produced a common refrain: What about the boys? These concerns have supported the galloping interest in single-sex educational programs. Teaching the boys about gender inequality and feminisms has made some progress, mostly at the postsecondary level. The association of boys with violence has received the strongest attention in U.S. schools, driven by the media coverage of school shootings. However, systematic approaches to violent masculinity are rare; it is more common to identify specific boys with problems than to see dominant masculinities as producing ongoing issues. Religion, genetics, and politics all support seeing males as naturally strong, with violence as a necessary partner.

Articulate, and often explosive, homophobia remains part of the hegemonic masculinity in schools. Attempts to assess and recognize violent masculinity are hamstrung by homophobia and tacit fears that if boys are not violent, they will

become homosexuals. Gay remains a prevalent and withering epithet in U.S. schools. Schools, teachers, and parents desire strong boys, and programs that aim to instill excessive cooperation, sensitivity, or other feminine-linked traits, are suspect. Such unspoken gender dynamics lead to more programmatic focus on girls because finding men to lead programs on male violence also remains difficult.

### Future

In UNICEF posters, microlending policies, and advertising campaigns for investment services, girls and women represent the future, the leading edge, and untapped potential. Although the United States has led the world in women's college degrees, it is at the bottom of 30 developed countries in women's leadership in electoral politics. Such disparate statistics signal the continuing paradox of gender inequality and change; that while reform is amenable to plans and campaigns, reaching and maintaining gender equality remains elusive. Reassembling gender relations needs to be reinvented and reinterpreted by each generation on its own historical terms. Gender-based violence, heterosexist narratives and discourses, and economic scarcity haunt the lives of women and girls around the world. Even when females symbolize the future, the present and its resources remain in others' hands.

## GENEALOGICAL RESEARCH

---

Genealogical research is a critical and postmodern approach to historical inquiry. In curriculum studies, the term *genealogy* is sometimes used to mean the same thing as history. At the same time, genealogical research also has a technical meaning that is derived from Friedrich Nietzsche's *On the Genealogy of Morality* (*Zur Genealogie der Moral*) and from Michel Foucault's "Nietzsche, Genealogy, History." In this more specific definition, genealogical research resembles archaeological research, but genealogy adds to archaeology an analytical focus on subjectivity. Genealogical research contributes to curriculum studies an approach to creative inquiry that is poised to critique an array of modern and structural assumptions about history and subjectivity.

Genealogical research differs from traditional history across five dimensions: It is cross-sectional, local, nonlinear, critical, and focused on subjectivity.

### Cross-Sectional Rather Than Longitudinal

Conventional or mainstream histories typically focus their analyses on continuities and on changes across time; however, genealogical research resembles archaeology, which focuses on a single stratum

or cross section. With an analytical focus on the relationships among various entities in a single time period, genealogical research does not concern itself with several of the persistent debates in traditional historiography. For example, genealogical research does not engage in the search for origins, claims of historical causality, questions of periodization, fallacies such as presentism, or meta-physical motors of history.

Some curriculum history has been written from the standpoint of the history of ideas, providing various accounts of changing relationships among language arts, mathematics, and science. Genealogical research, in contrast, historicizes subjects and objects by situating them in relation to other things that are happening at the same time. The archeological study then provided a basis for identifying a historically specific way of thinking that affords a critical genealogical perspective on the extent and limits of how it is possible to imagine being human.

### Local Rather Than General

Genealogical research strives to avoid grand narratives of history. Instead, genealogical research focuses on the local, the particular, and the unique. In curriculum studies, a genealogical focus on the local tends to promote a pluralist version of social justice and political relationships. This local focus of genealogical research has implications for theories of knowledge including progress, cycles, pendulums, dialectics, eschatology, destiny, and rational evolution. Epistemologically, genealogy's focus on the local tends to find value in small-scale and case-based studies rather than in large-scale or experimental research designs that aspire to generalize their findings beyond the site of their study.

### Multidimensional Rather Than Teleological or Linear

Traditional histories are often written as if there were an assumed purpose or endpoint of history (such as the advancement of science, the improvement of civilization, or the realization of eschatology). Furthermore, a traditional approach to history is likely to posit that time proceeds from past to future in one direction that resembles a number line. Eschewing linearity, genealogical research often challenges assumptions of both

continuity (emphasizing how much things stay the same) and discontinuity (emphasizing how much things change) in traditional historical accounts. An epigram of continuous history is as follows: Every day in every way I am getting better and better. An epigram of discontinuous history is as follows: It is not possible to step twice into the same river. Genealogical research generally adopts a critical attitude to both continuity and discontinuity. Genealogical research is more likely to suggest that historical events can be shaped by a multiplicity of influences, and history is always shaped within a historically specific perspective.

### Critical Rather Than Objective

Genealogical research does not seek to provide us with the way to understand the flow of things in history; instead, it proceeds from the premise that all histories are partial, selective, and shaped by lenses of the present. If we understand ideology as a politically biased way of seeing things, then genealogy assumes that all historical research (including genealogy) is inevitably ideological. In other words, genealogical research takes it for granted that perspectivalism is inevitable and makes no pretense to be objective.

### Subjectivity Rather Than Agency

Genealogical research generally engages the following research question: What kinds of possibilities have been created by historical relations for imagining what it means to be human? Relations typically included in genealogical research are power, language, epistemology, aesthetics, religion, economics, politics, law, schooling, and science. In his genealogical research, Michel Foucault offered a four-part framework by which to analyze the subject:

1. Substance (*substance éthique*): What part of myself am I supposed to work on? What part of me is supposed to change: My actions? My thoughts? My attitude? My self-concept?
2. Mode (*mode d'assujettissement*): For what reason should this change happen? What is the rationale or invitation for working on the self: To fulfill my duty? To live up to my potential?

To deserve a place in heaven? To enjoy my life on earth?

3. Regimen (*pratique de soi*): What am I supposed to do to change myself? Am I expected to control my appetites? Break free of rules? Be a leader? Be a follower? Discover who I am? Invent a new persona?
4. Telos (*téléologie*): What kind of person am I aiming to be? What is the ultimate goal of this work on myself? To become my own master? To be free of restraints? To become all knowing? To become one with the universe? To be normal?

These four dimensions frame a genealogical approach to critical curriculum studies.

## GENERAL EDUCATION

---

General education is a popular concept from the field of curriculum studies that holds commonly accepted connotations, but no uniform definition. Different from the terms *core curriculum* and *liberal education*, general education at both the secondary and postsecondary level has come to represent an organizational structure of curriculum

design rather than a concept with specific ideological or content-specified meaning. General education is typically viewed as a component of the student's course of study, along with specialized education, and does not imply a fusion or integrated configuration of knowledge or a focus on fields of arts and sciences. In its most basic form, the general education component represents that fundamental knowledge that is assumed to be known by all students. From this root conception, general education has focused on common learnings as core knowledge, skills, experiences, traits of mind, realms of meaning, and modes of inquiry, as well as what has been interpreted and/or redefined as being nearly synonymous with experience-based, integrated curriculum and liberal education. General education curricula are typically developed at the postsecondary level and then translated—articulated—into secondary school curriculum.

Designing the general education component addresses one of the most fundamental curricular issues—what knowledge is of most worth—and causes administrators, teachers, and students to attend to matters of curricular breadth in relation to depth. Another fundamental curricular issue inherent in general education design pertains to curricular balance—namely, will the general education content provide experiences, knowledge, traits, and/or skills that cross the full range of an organized area of study? Attending to these design issues has led to four basic types of general education programs: (1) General education within separate subjects represents the most traditional type and consists of an array of courses fulfilling program requirements. This type of general education is often dismissed as patchwork education or as cafeteria-style general education. (2) General education as core curriculum focuses upon knowledge and establishes broad, overarching configurations of content from a few general education-oriented courses. (3) General education as learning traits views content as a venue to foster a series of specified traits and abilities that emerge from general education experiences and courses. (4) General education as modes or realms of inquiry is a more abstract conception of general education as engendering essential meanings and methods to learn and understand knowledge and experiences.

The origins of general education in the United States stem from curricular programs at Columbia

University, University of Chicago, and Harvard University. At Columbia University in the 1920s, John Erskine's honors colloquium (serving as the guide to the St. John's Great Books program), the Contemporary Civilization courses, and the Humanities A and B courses led to one of the most comprehensive and sophisticated conceptions of general education with a well-developed balance of breadth versus depth and the introduction of a sense of program rather than the mere rearrangement of courses. The University of Chicago's New Plan of the 1930s is viewed as one of the best developed bureaucratic organizations with an innovative articulation between secondary and postsecondary schooling. General education at Harvard University was defined in the publication *General Education in a Free Society* (also known as The Redbook), published in 1945. Among its many refinements to the developing conception of general education, the Committee on the Objectives of a General Education in a Free Society conceived of the Harvard program in terms of utility and the role of the general education program in the furthering of democracy. In fact, the Harvard Redbook served to influence greatly secondary school administrators to develop balanced, disciplinary-oriented general education programs rather than to develop the then emerging core curriculum programs.

Daniel Bell's curriculum design efforts at Columbia University, described in *The Reforming of General Education*, published in 1966, introduced modes of inquiry as a method to provide conceptual unity for the course of study. This strand within the general education tradition was expanded with the release of the 1978 Harvard Core Curriculum and the alignment of traits of mind with specific course offerings. Contemporary use of the term at the secondary school level has become primarily one of fulfilling degree requirements. General education, while using the term *core*, is seen as a way to identify common knowledge for standardized testing. General education as part of overall curriculum design is dormant, for now.

## GENERAL EDUCATION IN A FREE SOCIETY (HARVARD REDBOOK)

---

The 1945 publication *General Education in a Free Society*, called the Redbook for its hardcover color, was one of the more significant mid-20th-century publications in the field of curriculum studies. Reconfirming the importance of general education in the secondary and postsecondary school curriculum and substantiating the role of academic disciplines as a way to construct a high school general education program, the Redbook provided schools and colleges throughout the United States with a clear justification for curriculum design and development. This rationale proved of great importance immediately following World War II when the purposes of secondary education and the tenets of democracy were being questioned. *General Education in a Free Society* represented a humanist tradition (ala Herbert Kliebard's groupings) and a response to and critique of the work of social meliorists and social reconstructionists. The Redbook committee, faculty members at Harvard University, saw the significance of "the search for unity" as a way to offer new opportunities for a dramatically expanding secondary and postsecondary school population. *General Education in a Free Society* would define the basic academic subjects in what became a traditional high school curriculum for the second half of the 20th century.

Although many education publications throughout the 20th century have generated national attention at the time of their release, few caused a press scandal as was the case with *General Education in a Free Society*. The *Louisville Courier-Journal*

violated the press release date by more than 2 weeks, causing *The New York Times* to release a story on its front page; other papers throughout the country also proceeded to violate the release date and presented the story as breaking news. As has always been the case, when Harvard University speaks, the country listens. In this instance, the country was ready to listen before Harvard was ready to speak.

The Harvard Committee on the Objectives of a General Education in a Free Society appointed in January 1943 by Harvard President James Conant and meeting weekly throughout a 2-year period, proposed specific curricular changes for the Harvard undergraduate program. These included (a) requiring three (newly developed) general survey courses to be required of all undergraduates: Great Texts of Literature to represent the humanities, Western Thought and Institutions to introduce the social sciences, and The Principles of Physical Science/Biological Science to present the natural sciences; (b) requiring three other courses from a larger group of existing departmental course offerings; and (c) adapting a basic English and writing course and limiting enrollment of the tutorials. The Harvard Redbook would popularize required survey courses at the college level that sought to integrate the separate subjects into broad fields of natural science, social sciences, and the humanities. The significance of the Redbook, however, stems more from its philosophical treatment of general education than from its curricular recommendations for the students of Harvard University. The purpose seemed not primarily to reform the curriculum at Harvard, but instead, for President Conant and Harvard faculty to articulate a philosophical foundation for U.S. education.

The term *general education* was defined as a portion of a student's education that fostered a sense of responsibility as a human being and a citizen. Past notions of liberal education for an elite were placed aside to focus on education for all—general education in a free society—where knowledge became the venue to develop traits of mind, those being effective thinking, clear communication, ability to make relevant judgments, and the clarification of values. An important phrase was developed by the committee to define goals for schools and society: to give scope to ability and raise the average. Conceived as a struggle between

Jeffersonianism and Jacksonianism, the Harvard Committee sought to reconcile general education and specialized education with a grounding in democracy and social transformation and an effort to design a curricular structure for breadth of knowledge with academic excellence.

In many respects, the Harvard Redbook exerted greater influence on the high school curriculum than postsecondary education. The Harvard Committee maintained that general education should represent one half of a high school student's education and should consist of eight (Carnegie) units consisting of a minimum of three in English, three in science and mathematics, and two in the social studies. As the Progressive Education Association's Eight Year Study was attempting to portray the college success of those students who attended integrated (non-Carnegie Unit based) secondary school programs, the Harvard Redbook was recommending that high school educators continue their separate subjects, Carnegie Unit curricular structure.

One surprising aspect of the Redbook's recommendations for Harvard's general education program pertains to the source of its curriculum recommendations and lack of protest from Harvard students. Most postsecondary curriculum reform that calls for a change, or in this case increased requirements, typically elicits protests from students. Surprisingly, these protests did not occur. Student newspaper articles from 1945 (*Harvard Service News*) maintained that the Harvard Committee used as its starting point the 1939, 1940, and 1942 Student Council reports and that these statements anticipated the general education proposals. In essence, the students had already suggested additional course requirements throughout the preceding 6 years.

## GEOGRAPHY EDUCATION CURRICULUM

---

Geography literally means the study of the earth. As a discipline, it is the study of spaces and places and a way of envisioning events in spatial terms. Geography is predominantly used as a tool for understanding people and places in the world. As described in the history, geography education primarily relies on maps and a set of themes to help students learn about places. These tools offer students a picture of a world they cannot travel. This common approach is criticized for being too descriptive, simplistic, and deterministic, a criticism that also underlies other theoretical shifts in curriculum studies. As with critical theory writ large, critics purport that understanding places must attend to how and why the descriptors of those people and places arose. This entry draws largely from critical geographers as a means of examining the new directions and possibilities for geography education. It is organized around the definitions of space and place and how these terms shift the inquiries in geography education. This inquiry into space and place is important as these appear throughout curriculum studies.

### Distinguishing Space From Place

*Space* and *place* are terms that flow well together, so well that they are often used interchangeably. But these terms are not interchangeable, and their distinction is core to geography. Geography is the study of the spatial or how things are located spatially on their own and in relation to one another. Geography is also the study of places or the meaning of space. These terms need fleshing out in order to understand their full potential in the discipline and as used in curriculum studies.

Space is most appropriately linked with location, whether a physical or conceptual location. Traditionally, geography has been aligned with the study of physical locations. Maps are a common means of

depicting these spaces. They provide a spatial representation of spaces too large to comprehend or too physically distant to visit. Maps reflect distance between and within locations, highlight the boundaries around and between locations, and reveal landscapes. Advocates for geography education are attentive to the need for a locational understanding of the world. People should know the location of allies or enemies, spatially understand the relationships between boundaries, or understand why, based on climate and landforms, certain places are isolated or connected with other places.

Space is also a broad term in curriculum studies. It is used in various theoretical and methodological frameworks to refer to intellectual or conceptual locations and their origins. Theorists may refer to the space where ideas come together to develop a thesis or theory. They may refer to the space of research meaning not the space where research is conducted, but the space around the research. What is referenced here is a set of values or concepts that organize approaches to research and knowledge. Geographers call this abstract space. These conceptual or intellectual spaces are used to give meaning to places. But consider the researcher bound to producing a certain kind of space or environment for research. Perhaps he or she seeks to create a dialogic space where there is engagement of multiple or marginalized voices. He or she is seeking a conceptual space of equality and uses this space to affect how he or she conducts his or her research regardless of the physical location in which it is conducted. People across disciplines are also attentive to the space of text and how text is laid out on a page. Like the traditional maps of geography, these spatial representations are designed to connote a certain meaning to the reader. In many academic fields, researchers are attentive to what is communicated in all spaces available. There is an effort not merely to study physical location, but to inquire into the presentation of intellectual and conceptual spaces that produce ideas and incite people to act in particular ways.

Place is most commonly distinguished from space because places acquire meaning through human interaction with or in that location. Place is the lived space people encounter on a regular and daily basis. Although space refers to the location, place is studied in an effort to understand the meaning of that location—both the meaning given to and

that taken from that location. Places are human constructions. A space has a physical landscape, but how people respond to and act in that landscape produces the difference between space and place. For example, two different stores in a chain of coffee shops may appear quite similar as spaces—familiar layout, colors, and textures—but how people interact in each site (maybe determined by the kind of people drawn to each or its accessibility) changes the meaning of each place. Their different clientele and different environments mean that these two spaces are unique places. The meaning of each coffee shop is contingent upon the people and their interactions with the shop itself and one another. While one site might be a quiet shop where people sit for a while to study, a similar coffee shop at a busy intersection may be a place where people stop in for a quick cup of coffee and conversation. Scaling this up to a city or country, these entities are also places not because of the landscape, but because of the unique narrative that describe the people therein. Although many geography classes reduce the study of people to a set of cultural universals, collectively these narratives offer a larger understanding of this place. India is not only the set of features about the country, but also the meaning given by the people therein. It is also important to recognize that there is variation within spaces, giving complex meaning to these places.

A concept deeply rooted in the study of place is identity. Because the meaning of place is contingent upon the individuals therein, who these people are and how they perform in those spaces is critical to its meaning. People hold many identities and make decisions about what identity to use in a given situation. Those decisions involve a number of factors including why one enters a place, what one expects in that place, the meaning of the place they enter, and people they interact with. How and why people use particular identities with or in a place affects the meaning of that place. In addition, the identities people hold are affected by their interactions with/in various places. As people come to identify with or against various places, they are engaging and changing their identities.

### Making Sense of Place

Making sense of place is a central geographic skill. Much of geography education relies on the notion

that places have collective meanings. It is then presumed that the people within that place act to uphold that meaning. This sense of place often has historical roots and evolves in a given location over time. The particular sense may be affected by economic, political, cultural, or social conditions that mark areas. Many small towns in the United States have a relatively contained identity. Local rules (or lack thereof) and cultures support and maintain this meaning. In one area, people feel safe and choose not to lock their cars or houses, a practice unheard of in other areas. People also uphold this sense of place by participating in local fairs, markets, festivals, and rites that perform a certain meaning. The coming together of people to practice these actions publically upholds the meaning of that place both internally and externally. Although locations have a sense of place, categories of places are often ascribed particular meanings. Using the term *urban* to denote a city provides a collective imaginary of this location. Geographic categories, which are largely unquestioned, provide a lot of information because of collective connotations of terms and places. The prevalence of sense of place or collective narrative of place in geography education is partially a tool of practicality. With so many places to learn about, it is far easier to pursue an accepted, simple, and clear narrative about places. But it is also a tool that arises because the focus of geography is usually on learning about places rather than on understanding how and why those places exist as they do.

Critical geographers assert that in addition to learning the sense of place, there needs to be inquiry into how, for whom, and why that sense of place exists. Places have many users, and given individual attributes, it is unlikely that all people think about places in the same manner. Even when people act publicly to uphold a particular meaning, they might have counternarratives about that place. Recognizing that a place is complicated by the multitude of meanings individuals hold of that place, it is important to query the dominant sense of place that is the crux of what is studied in classrooms, the media, and other sources of geographic information. The dominant narratives typically exist for a reason, and claiming them makes a statement about inclusion and exclusion in a place. Upholding the small town narrative in the previous section may discourage some people from choosing

to enter that space if their identities do not align. Everyday actions are guided by external meanings people carry into a place. Before people enter a church, grocery store, or restaurant, they already have a set of expectations about how to act and what can be done within.

Feminist, Marxist, and postcolonial geographers examine the political, economic, and social systems that create and necessitate senses of place. Marxist geographers study the distribution of capital and the way in which this has forced development. The desire for cheaper places of production and new markets has influenced the meaning of many locations as consumer and producer areas. Feminist geographers are attentive to the ways in which places acquire feminine and masculine tones. Their questions seek to understand how gender norms and expectations are written into and regulated through divisions of space (the public vs. private realm), gendered places (Mother Earth), and the organization of a space (how a meeting room is arranged). Postcolonial geographers examine colonial geographies and maps to deconstruct the othering process of colonized areas and the ways in which this is perpetuated or discontinued in the postcolonial era. Each framework is interested in the meaning of places and how they exist not merely within, but because places interact with other places.

### Geography's Place in the Social Studies

Geography education is increasingly attentive to the changing meanings of place because of the increased global interaction and communication between seemingly distant places. As a stand-alone course, particularly in elementary and middle school, geography is organized as a regional study of the world. Many states differentiate between the eastern and western hemispheres in courses to allow a more in-depth study of different regions. The western hemisphere typically includes North America, South America, Central America, and Europe—all locations deemed relatively close to the United States spatially and culturally. The rest of the world is relegated to the eastern hemisphere, an area relationally distinct and distant. The very division of east and west provides particular markers and ways of understanding the places that are described and studied in these classrooms. As

much as this in-depth study of both human and physical geography provides a vision of untouchable peoples and places, this presentation of place fails to ask critical questions about those meanings and their origins.

Geography also struggles to receive its own billing. In high schools, geography is commonly embedded within global studies or world history and sometimes U.S. history. The placement of geography within global studies and world history is reflective of geography as the discipline that helps students understand the world outside the United States, but it also reduces geography predominantly to the study of the physical environment that shapes global interactions and historical patterns. Global studies often carries some foundational geographic concepts, but the focus on place relays particular ways of thinking about places through modern global themes like the environment, conflict, population, and so on. Although some critics are concerned that geography is watered down when integrated into global studies or history, the link of geography within the other social studies disciplines should not be overlooked. History, civic engagement, and economic systems all happen within and to places. They typically have a spatial arrangement. The study of these other disciplines is augmented when place and space are considered, but only if the concept of place is actually studied. Understanding how a sense of place arises requires the study of historical, political, and economic patterns. The events studied in history affect and are affected by the meanings of places. The way in which citizens enact their civic rights and responsibilities affects the political meaning and description of a place. The distribution of economic systems has spatial implications and arises from particular spatial patterns. Each of these is a reminder that while geography education needs to retain its own disciplinary frameworks, geography is also a way of helping to understand and advocate for the importance of the study of the other social studies disciplines.

Maps remain the most common tool in any geography setting to get information to students. Increasingly, geographers and teachers are attentive to the stories told by maps. As human representations, maps (their boundaries, shape, patterns, content, labels, etc.) are designed to depict a

particular story told by certain individuals or groups. New work with mapping poses questions about the maps themselves rather than merely asking whether students can identify a location or use a scale or key. It proposes that questions arise about how lines came to be drawn, why, and what those mean for the people in those locations. Although the locations are often taken for granted in understanding a place, how people understand those borders and how they transform their lives remains an important question. As the field of geography education responds to globalization and the emergence of transcendent boundaries, there is a plethora of reasons and manners in which to inquire into and about boundaries, maps, and their meanings.

## GEOGRAPHY EDUCATION CURRICULUM, HISTORY OF

---

The discipline of geography has neither a linear development nor a clear location in the academic world. Geography has long struggled with whether it is a science or a social science. The struggle partially reflects the uncertainty of human behavior

in trying to make objective and predictable claims about the relationship between people and their physical environment. The struggle results in distinctions between human and physical geography and in questions about their unity. These struggles alongside various theoretical claims mean that the discipline is fragmented, but carries on. As the parent of geography education, geography's struggles are reflected in the history of geography education. A challenging aspect of describing the history of geography education is that it is not always a distinct subject. Geography has often been disguised within the social studies. This ebb and flow of geography education and critiques of its imperial intentions organize this entry.

### Geography's Place in Schools

Geography was a core subject in Greek and Roman education. As such, geography was part of the classical education in the United States' earliest schools. When public education fully emerged in the 20th century, the discipline of geography was largely focused on physical geography. Thus, the modern origins of geography in public schools focused on the physical landscapes, climate, boundaries, and so on. Although understanding physical environments requires problem-solving skills, as a subject physical geography is largely a rote study of places and features on maps. The discipline does not presume that students are cartographers; it prepares them to be consumers. They are taught to memorize and synthesize the data represented on maps. The human component of geography was not unnoted; it simply became subsumed within another field called social studies. Through the 1960s, geography was in a tug-of-war as to whether the social component should be incorporated into geography or into social studies. It most often remained in the social studies.

The first real challenge to geography's integration with social studies arose in the 1960s when the High School Geography Project attempted to develop new geography that attended to solving geographic problems more akin to the discipline of geography. But the lack of experience on the part of teachers and policy makers doomed geography to stay the course. In the late 1980s, following dismal reports about students' geographic

knowledge, the National Council for the Social Studies and the Geography Education Standards Project created standards that demanded students know more than just where places are located on maps. Both set of standards contain central themes—location, region, human characteristics, physical characteristics, movement of people and ideas, and human–environment interaction. These themes provide a rigorous method for students to learn the attributes of a region and thus the countries in that region and a way of categorizing information so that students can compare people and places and make predictions about people living in various environments. These projects also seek to use geography as a tool for developing a spatial understanding of students’ surroundings. There is recognition that students make mental maps and that geography education should explore these maps in addition to cartographic maps. For all the efforts to make changes to the discipline, tests continue to show dismal results, and educators question the value of geography as a course. There are proposals in many states today that would remove geography as a distinct discipline and place it within history.

### An Imperial Origin

The history of geography education shows that it gets more attention in times of national crisis (such as in war) because there is a desire to create a national collective. In these eras, geography serves the purpose of heralding the United States and its (European) allies while simultaneously justifying the contestation toward the Other with whom it is at war. From its beginnings, geography used maps to teach students about new places they heard about in newspapers and political speeches. European colonization, two world wars, and the ensuing League of Nations and United Nations presented a host of unfamiliar places to students. It was important that they learned the boundaries of the changing world and the important details that brought a nation or region into the global portrait. This purpose—teaching students about people and places they hear about, but may never see—has continued to underlie geography education. Although at one time geography education emphasized individual countries or continents, today the discipline borrows from geography and divides the world

into regions or realms. Regional studies grouped places according to physical proximity and sets of cultural, historical, political, or economic characteristics. What emerged are regions that cross continents such as the Middle East or regions that divide continents such as Asia into more manageable areas of inquiry.

The history of learning about the Other concerns geography education critics. They claim that the emphasis produces a divide between “us” and “them.” The unknown or Other is exotic and far away spatially and culturally. The othering process makes this true regardless of similarity or physical distance. They argue that the rise of geography to support nationalism occurs as a means of justifying the self and vilifying the Other. During World War II and the cold war, dictators and socialist economies were portrayed as aggressive and oppressive in relation to the developed, democratic societies who opposed them. The portrayal of one place provides justifications for the actions of another and enables the perpetuation of imperial practices. It is this history of geography education and its role in national identity that leads critics to claim it is a tool of imperialism. Although cadres of geography educators have written about the need to be more attentive to the political, economic, and social systems that are used to define and categorize people, these means of inquiry are rarely drawn upon by policy makers and curriculum writers who define what should be taught, regardless of what individual teachers might teach. The field is currently at risk. It must make a case for why geography matters and why it is useful for students. Such defenses usually call up conservative rather than radical responses.

## GIFTED AND TALENTED EDUCATION

---

Gifted and talented education takes many forms. Students labeled as gifted and talented are often served through the following practices and curricular options:

- *Enrichment*: Students remain in general education classes, but receive extra material to challenge them. These can be modified assignments or the opportunity to participate in special programs such as Odyssey of the Mind, science fairs, and extra course offerings.
- *Curricular Compacting*: Regular school material is compacted by skipping repeated exercises and by testing to determine what the student already knows and does not need to do again.
- *Acceleration*: Students are advanced to higher-level classes that are covering more advanced material. This advancement may take the form of skipping grades or of completing the normal curriculum in a shorter period of time.
- *Segregated Gifted Pull-Out Programs*: Students spend part of their time in the regular class and part of their time in a gifted class. These may be half-day, full-day, or for several hours a week.
- *Full-Time Separate Gifted Classes or Schools*: Students are removed from general education and served in classes or schools specifically designated as gifted or talented.

### Arguing For and Against Gifted Education

Those who argue in support of specialized course and school offerings for students identified as gifted claim that the educational needs of such students cannot be met within the mainstream of general education and that, almost by definition, the regular classroom cannot be the appropriate educational placement for gifted students. They often claim that gifted children should learn in the company of others similarly designated, citing the social isolation and stigma sometimes experienced by those who are performing at a higher level than peers. Proponents of gifted education further argue that it is an equity issue—that schools provide for students who are below average intellectually and academically through special education programs

and thus, it is only fair that gifted students be entitled to similar specialized services. They argue that gifted students are often neglected in schools and represent an important national resource.

Critics of gifted education, including Mara Sapon-Shevin and Alfie Kohn, argue that gifted education programs provide enriched curricular and instructional opportunities to students based on limited and partial measures of intelligence and that giftedness as a general characteristic is, in many ways, a social construct. Sapon-Shevin has argued that gifted education programs are fundamentally elitist and meritocratic and tend to provide enrichment to students who are often (not always) already advantaged or privileged based on their race, socioeconomic status, and family background. Gifted programs are also used to stem White flight in mixed race communities by providing a special program for gifted students that resegregates them within the context of public education. Jeannie Oakes argues that gifted programs are simply another form of tracking, but are not subject to the critiques of tracking because they are theoretically based on some measurable characteristic—that is, intelligence. Kohn has written about the ways in which parents insist on educational opportunities for their child that are superior to those provided for other children, becoming single-minded advocates and ignoring broader issues of equity and social justice.

### Issues in the Field of Gifted and Talented Education

#### *Who Is Gifted?*

Because entry into gifted programs is often based on standardized testing, issues of cultural bias and differential experiences often result in gifted programs that are White, middle class, and serve those who are already advantaged within the educational system and society. Conceptualizing intelligence along a single continuum narrows who is included, denies multiple intelligences, and results in a globalizing label.

#### *Who Gets What and How Is This Determined?*

Assumptions about which children can benefit from particular enriched activities can result in a highly differential curriculum that denies the

majority of children opportunities to experience authentic, multimodality, interactive, and collaborative experiences. In one classroom, those labeled as gifted built gingerbread houses using metric measurement while the nongifted completed worksheets. Opportunities to participate in science fairs, drama, music and art projects, field trips, and interactions with guest speakers are often limited to those in the gifted program while there is evidence that all students benefit from those activities and may have fewer opportunities for exposure to these options based on their socioeconomic, familial, and cultural identities. Some gifted advocates such as Joseph Renzulli have tried to mitigate these problems by describing gifted behavior rather than gifted children and by offering different kinds of enrichment to a broader group of children.

### *What Are the Effects of Gifted Programs on School Culture and Educational Programming?*

Designating students, classrooms, teachers, teaching materials, and teaching strategies for the gifted limits schools' ability and willingness to see students as individuals, to support differentiated curricula in the regular classroom, and to pay close attention to creating a social climate in which all children are valued and safe from exclusion and marginalization.

and curriculum in response to a world in which our geopolitical, environmental, and economic fates are increasingly interconnected. It focuses on knowledge of global issues, on understanding the world through interrelated systems, and on multiple perspectives and cultures. Young people learn about global issues from the cultural curriculum of television, movies, newspapers, and magazines; from social and religious groups, friends, and family; from their work environments and schools; and from a range of explicit formal curriculum in school. The related but distinct fields of social studies, science, literature, environmental education, multicultural education, critical theory, peace education, education for human rights, and development education all include theorists and organizations who call for globally focused curricula. Global education can both globalize a single curriculum subject area and it can also serve as an interdisciplinary integrated curriculum synthesizing elements of various curriculum subject areas such as history, economics, geography, the arts and literature, and science. To add further complexity, corporations, pundits, politicians, and nongovernmental organizations also weigh in on the question of what a global education should entail. Thus, global education includes a wide range of approaches and theoretical understandings of the political, educational, moral, imaginative, technical, and economic issues at stake.

Curriculum studies not only explores the complexity of global education as a field that can be understood through global issues, systems, and cultures, but also much more broadly explores the conceptions of knowledge, culture, power, and citizenship in use in various global education curriculum discourses—the different imaginaries that can be found in curriculum. Further, global curriculum is understood to include not just theories and the explicit and formal curriculum, but also the implicit messages of the hidden and null curriculum and the broadly available cultural curriculum.

Global education in this current era of urgency and contentment includes diverse curricula that can be categorized into at least seven general types. Most typical are approaches that do not question unequal global power relations but explore culture as a monolithic and even as a

---

## **GLOBAL EDUCATION**

---

Global education has been gaining increasing prominence in K–12 and higher education policy

commodity or a tool. These include disciplinary global education, pluralistic global education, and neoliberal global education. In contrast, liberal cosmopolitan global education, environmental global education, critical global education, and peace-oriented global education all offer critiques of global power and transnational capitalism and more exploratory and poststructural ideas about culture. As is detailed below, these approaches have very different origins and some distinctive aims (see Table 1), and they developed with different justifications and core concepts as is detailed below.

### Disciplinary Global Education

Disciplinary global education is the most commonly practiced and can manifest in a number of

typical courses, such as world history, geography, international relations, and beyond social studies, in earth science, and world literature and language courses. Disciplinary thinking, or learning to use the analytical tools of a geographer, historian, or political scientist, for example, is the intent of such courses. Proponents of disciplinary education typically assert that they have no civic agenda; they are just teaching knowledge and skills. In disciplinary education, the broad aim is to transmit knowledge and culture, and this includes unreflective factual teaching about the power status quo. When any subject learning is deemed apolitical, it means instead that the politics are acritical and unexplored and are assumed to be normal.

**Table 1** Types of Global Education Curriculum

<i>Type and Related Movements</i>	<i>Curricular Rationale and Goal</i>	<i>View of Diversity</i>
Monocultural (English Only, Traditional National History)	Solidifies national identity, unity, and power. Enhances feeling for the nation.	Defense against diversity.
Pluralistic (Human Relations, Multiculturalism)	Global understanding as a means to improve life for everyone or maintain and enhance power or capital.	Explores diversity for personal and mutual advantage.
Neoliberal (Business Education)	Global understanding as a means to enhance power or capital.	Explores diversity for economic and geopolitical advantage.
Environmental (Ecofeminism, Ecology, Place-Based Education)	Human rights and global diversity are not as important as sustainability, but indigenous cultures that protect the environment should be studied and protected.	Explores diversity to understand cultures and promote sustainability.
Liberal (Critical Thinking, Human Rights Education)	Maximizes global liberty and justice. Diversity can be managed by negotiating and balancing the rights of individuals and groups through deliberative process.	Manages diversity through rational deliberation and law.
Critical (Critical Theory, Critical Race Theory, Postcolonialism)	Critiques structures and systems of global oppression and uneven power relations and develops resistance and transformative potential.	Critiques the ways diversity is created, exacerbated, or denied by oppressors.
Peace-Oriented (Conflict Resolution, Nonviolence Education, Psychoanalytic Education)	Develops the ability to respond to both personal and global issues with nonviolence, love, and compassion and to resolve anger, fear, and conflict to bring peace and justice.	Diversity will cause problems until we each learn to confront our deep human fears about difference and suffering and foster our deepest compassions.

### Pluralistic Global Education

Pluralistic global educators focus on cultural universals more than cultural difference and on an optimism about cross-cultural understanding, open-mindedness, and the ability to have knowledge and appreciation for other peoples' points of view. Every democracy, even the more culturally homogeneous, engages in a process of myth making and homogenizing to create a new national identity, and thus new nations and nations faced with internal divisions or external threats usually promote monocultural curriculum. Pluralism, however, is the most common approach to diversity in established democracies. Pluralists do not deny or defend against culture differences; instead, they see diversity as inevitable and as something to understand and learn from—even as a resource that can enhance the individual and the dominant culture. In this type of global curriculum, the general sentiment is that we can all get along if we learn about each other, and thus this approach focuses on creating solidarity and similarity out of difference and ignores institutional racism, unfair trade, global inequalities of wealth, colonialism, and sexism. Students are to appreciate the beliefs, traditions, and values of different cultural groups, and lessons celebrate diversity. Such an education situates learning about people as a form of commodity, though not in its economic sense, but rather as a tool such that learning about others is principally based on enhancing oneself. The global students can enjoy the food, music, art, textiles, and consumer goods of many places.

### Liberal Cosmopolitan Global Education

Liberal cosmopolitan global education, in contrast, is rooted in the notion that all global citizens are of equal human rights and equal moral standing, but all global beliefs, cultures, and practices can be and should be critically debated. In the liberal view, cultures are not to be consumed or tolerated in curriculum, but are something very much different. The purpose of classical liberalism is not to maintain any view or affirm any culture. Any potential cultural value or option is to be explored. Advocating a pluralistic appreciation for multiple perspectives denies or underestimates the discomfort of real difference. For example, how can a person simultaneously value something such as

equality for women and appreciate a nation that legislates that women are intrinsically inferior? Should we educate that this sort of national diversity is an asset? What would it mean to tolerate this? By embracing the Other, pluralistic theories of global education highlight and consider difference, especially third world difference, yet avoid the politics of non-Western marginalization and the discomfort connected with encountering intractable difference by discovering and celebrating otherness relatively uncritically. In liberal cosmopolitan approaches, diversity brings inevitable difficult issues of difference, which can best be understood and even possibly mediated through public discussion and politics, with critical analysis and rationalist, legalistic discourse. All forms of difference are to be explored, debated, and negotiated. Global issues and diversity exist on an equal power plane for all to address and explore.

### Neoliberal Global Education

Neoliberal global education aims not at exploring global diversity within an ethos of equal human rights, but aims to understand global issues and people in order to maximize advantage. It is directed at mostly private interests and is primarily concerned with better preparing the workforce and consumers through learning about the world. This approach to curriculum tells us that the world is globalizing and that we need to learn about it to succeed; neoliberal global education is problem based, and the problem is maintaining power in a globalizing world. Corporate citizens who are able to move and work easily from place to place in a global world can maximize income and power. Global issues and diversity are something to master for the sake of geopolitical and economic advantage. One studies the Other to be able to teach them or work with them or market to them.

### Critical Global Education

Critical global education aims to overturn the unequal power relations that neoliberal global education aims to maintain. Further, critical global educators believe that the disciplinary, pluralistic, and liberal approaches to global education do not explore the starting grounds on which cross-cultural exploration occurs, but instead assume a

neutrality and equality that cannot be reconciled with the realities of either national or global prejudices or with economic inequalities. In this approach, inequality of power and privilege are central to exploring global issues, systems, and cultures, particularly the colonial past and the neocolonial present in which the powerful use economic, political, and cultural means to perpetuate hegemony. Critical perspectives explore by what social and economic processes global people, cultures, spaces, and places are constructed and how these constructions can be explored within discourses and practices tied to various positions of power. As Marx proclaimed, and as others from Paulo Freire to Michel Foucault to Frankfurt school theorists reiterated, domination fosters resistance; critical global education aims to empower students to help create a more just world.

Critical global education is not typically rooted in personal understandings of power and culture but instead is often directed toward an amorphous massive disembodied thing, called global society or transnational capitalism, to which it can be difficult to respond. Students tend to read about global heroes and the global oppressed in general. Personal connections are not easily made. Critical work is most often described as conducted by heroes, by the likes of Che Guevara and Ghandi. Critical global education theory and pedagogy have been critiqued as rationalistic, positivistic, masculine, and rooted in a utopian, revolutionary metanarrative. Global issues and diversity are something to master for the sake of the liberation of the oppressed. As critics have suggested, the relationship to the Other is that one is to liberate, a relationship that is condescending.

### **Environmental Global Education**

Environmental global education is also concerned with power and with global economic systems, but aims not at liberation, justice, and human rights, but at creating global responsibility directed toward sustainable societies. The first-order value is not democratic values or global human rights, but global sustainability. Although critical approaches focus on large-scale processes, environmental global education often emphasizes local placed-based issues and commitments to preserving ecology through technical as well as political means.

Students are encouraged to learn about their local environments, specifically how human development has shaped the landscape, what resources are employed, and the various effects of consumption patterns. Environmental education is closely tied to the goals of sustainable development, or the means by which societies can meet current needs while preserving the capacity of the environment to meet the needs of future generations. Critics argue that revitalizing attention to local places runs counter to a fully global orientation, and environmental education tends to side-step difficult questions about culture and identity. The primary allegiance is planetary rather than humanistic, so issues of culture are less important except to the extent that different cultures value the environment differently. Indeed, some advocates of a radical environmental education argue that democracy has become largely a technology of capital that has and is destroying valuable indigenous knowledge bases. Others have claimed that such claims are premised on a romantic sense of indigenous cultures that fails to explore the problematic dimensions of power and status within these communities.

### **Peace-Oriented Global Education**

Peace education, unlike all of the above approaches, focuses on developing the ability to respond to both personal and global issues with nonviolence, love, and compassion and to resolve anger, fear, and conflict to bring peace and justice to global people and events. UNICEF describes peace education as a process of promoting the knowledge, skills, attitudes, and values needed to bring about behavior change that will enable children, youth, and adults to prevent conflict and violence, both overt and structural; to resolve conflict peacefully; and to create the conditions conducive to peace, whether at an interpersonal, intergroup, national, or international level. Peace education draws from nonviolent social change movements, especially from Buddhist and Quaker traditions, and also draws on psychology and psychoanalysis. Global peace educators recognize suffering, fear, and anger as fundamental characteristics of the human condition that can be improved through compassionate practices and forms of conflict resolution. The intention of this type of global education is

inner transformation and liberation from fear and anger because only people who have confronted the inevitable dark side of human nature and have learned to be open to love and see one another as connected by our common humanity can transform society into a place of peace. Global peace educators teach that conscious and subconscious attitudes and feelings support structural injustice and overt violence, and thus it is these and not the logic of our idea or the structure of intuitions that we must focus on most closely.

### Global Education as Citizenship Education

Neoliberal, vocational, and private visions will inevitably be expressed in schools. In public schools or in a college that focuses on liberal as well as vocational education, such visions should be reflected upon through broader democratic public values. Four types of global education—liberal, environmental, critical, and peace oriented—are civic and democratic in their orientation because they highlight respect for human rights, the reverence and recognition of places and ecology of the environment, awareness of inequality, and a call for social justice, yet these types often remain in the null or absent curriculum. The possibility for a more just world rests on the educated imagination. Globalization has brought forth something new in human history, and curricularists struggle to bring forth a fundamentally new education that is equal to it.

## GOALS 2000

---

In 1989, a coalition of state governors from all 50 states and President George H. W. Bush proposed an educational reform program they named Goals 2000 as a solution to the failing state of U.S. public schools and the nation-at-risk image plaguing the country. The program set national educational goals for U.S. students that were to be achieved by the year 2000. As a result, Goals 2000, the Educate America Act (P.L. 103-227), was developed and later signed into law by President Bill Clinton, Bush's successor, on March 31, 1994. It provided funding to schools to help all students reach high levels of achievement and their full potential through systemic reform. This emphasis on achievement result was embodied in changes in curriculum, instruction, professional development, accountability, and assessment. Curriculum was to be aligned with performance standards. The act established a framework to create academic standards, assess student learning, and support students who needed help to meet the standards.

Goals 2000 consisted of eight national goals. The goals included that by the year 2000 all children in the United States would start school ready

to learn and that the high school graduation rate would increase to at least 90%. It also codified goals concerning academic and occupational skills achievement, U.S. global leadership in math and the sciences, adult literacy, drug- and violence-free schools, professional development for teachers, and family involvement in the academic, social, and emotional development of their children. The goals were intended to make Americans competitive in a global economy and able to develop into responsible citizens. The goals were to do this by holding all students to high standards. Focused content standards were to guide local curriculum development. The underlying philosophy was that if students were not challenged to fulfill their potential, they never would.

Through Goals 2000, the government provided the goals; however, states and communities were given the power to determine how they would reach them and to create aggressive plans that could potentially be funded in whole or in part by the federal government. Colleagues were encouraged to work together toward the goals. States submitted applications for funding. Applications outlined how the states planned to improve their schools and curriculum. Congress appropriated \$105 million for Goals 2000 in 1994.

Initially, the goals seemed unobjectionable. However, serious pitfalls soon began to reveal themselves. For example, although presented as a voluntary program in which states did not have to participate, nonparticipation meant states passed up substantial federal funding. Hidden mandates required that states submit proposals for funding and plans for improvement, be penalized if they failed to comply with their proposed plans, and form partnerships with schools, universities, and businesses. Conservatives and homeschoolers criticized Goals 2000 for putting public schools in the position of monitoring various services for children.

In 1999, the National Education Goals Panel reported that although the nation had not yet completely satisfied any of the eight goals set by Goals 2000, some progress had been made. For example, advancement was made in preparing preschoolers for school entry. It was evident that more children were entering school physically healthier than previously, and they were better prepared for kindergarten as a result of effective literacy experiences in

preschool and in the children's homes. Furthermore, progress was evident in student achievements through advanced proficiencies in elementary and middle school math and reading.

However, progress toward two of the goals actually regressed. The percentage of public school teachers certified to teach their main subject dropped, meaning students were being taught by less qualified teachers than previously. Also, a substantial increase in the use of illegal drugs occurred.

In November 1999, the House of Representatives refused to reauthorize Goals 2000 based mainly on persistent opposition from families of home-schooled children. Funding was ended; however, several titles of the law still remained in effect. The complete withdrawal of authorization for Goals 2000 came with the passing of President George W. Bush's No Child Left Behind Act (H. R. 1), which zero-funded the Goals 2000 program.

## GOODLAD, JOHN I.

---

John I. Goodlad (1920– ) is a leading educational researcher whose work has had a major impact on school reform, professional development, and curriculum studies. His studies have illuminated many components of education—from teacher training programs, to school administration, to classroom

interactions—that affect curriculum implementation. Goodlad’s primary object of inquiry has been the site where the curricular rubber hits the road—the school. His 30 books and hundreds of articles describe the arc of a long, varied, and deep engagement with the scene of schooling, or as he has put it a, “Romance with schools.”

One could say that Goodlad’s career mirrors the evolution of the institution to which it was devoted. Beginning as a teacher in a one-room schoolhouse, he went on to become a leading figure in the effort to understand and improve the modern school (i.e., postagrarian, comprehensive), whose conventions quickly became so familiar as to be invisible. What grasp we now have of these commonplaces is thanks in large part to the remarkable career of Goodlad. He not only participated in the Conant report—which had a major effect on the secondary school curriculum—but also spearheaded the “Study of Schooling,” among the most ambitious onsite studies of U.S. schools ever conducted.

Goodlad was born and raised in British Columbia. He left Canada for graduate study at the University of Chicago and as it turned out, an academic career in the United States. After completing his doctorate under the supervision of Ralph Tyler, Goodlad held a series of positions in teacher education, eventually becoming the head of Emory University’s Division of Teacher Education. He then moved to University of California, Los Angeles, where he served as University Professor, the director of the lab school, and dean of the Graduate School of Education. Later, at the University of Washington, he founded the Center for Educational Renewal.

Goodlad has produced one influential work after another, from *The Nongraded Elementary School* that significantly challenged prevailing conceptions of school organization, to *Educational Renewal: Better Teachers, Better Schools* that proposed a route to educational reform based on whole-school emergent energy and commitment to improvement. None, however, has been more important than his pathbreaking *A Place Called School*. Named American Educational Research Association’s Outstanding Book for 1985, this work is still today one of the most referenced accounts of the cultures and practices in schools across the United States. The monumental “Study of Schooling” on which this book was based

included thousands of students, parents, teachers, and administrators from a broad cross-section of schools and blended qualitative with quantitative approaches. Goodlad’s findings include, for example, that classrooms are loose-knit rather than tight-knit groups and that vocational and academic tracks for high school students are often mutually exclusive. Through this and other studies, Goodlad has contributed to curriculum studies a considerable amount of data about the functions and cultures of schools.

Goodlad has also been a leading thinker on school renewal, a term he prefers over the more common reform. To Goodlad, reform signals mandates imposed from outside, detached from the complexities of schools and the realities of implementation. Renewal focuses less on particular changes—such as involving teachers more in policy decisions or adopting specific curricula—than on the ongoing ability to change. Renewal is therefore devoted to creating a culture of change within the school, one that originates with, and is accompanied by, commitment from those involved.

Goodlad’s reconceptualization of the school as an environment that itself must learn and adapt is paralleled by his arguments that teaching is a profession demanding continuous learning and reflection. Treating teaching as a mechanical or servile occupation may facilitate short-term school reform, but it undercuts the capacity for renewal. For teachers to be leaders in school renewal requires changes in the way teachers are prepared and schools are staffed. For example, teacher preparation should include prolonged initiations to the layered contexts in schools and guidance in how to negotiate school culture. If teachers are to have energy and vision for renewal, they must be supported to lift their gaze beyond their immediate tasks and classroom walls to engage the school as a whole. Further, schools should include a cadre of teachers with advanced training who can oversee more students, work with learning disabilities, and mentor junior teachers.

Closely related to this is Goodlad’s call for school–university partnerships featuring centers of pedagogy bringing together practicing teachers, preservice teachers, and faculty and students in the arts and sciences. Such partnerships would bring into focus important, but underaddressed educational concerns enriching professional preparation and development.

Goodlad's contribution includes not only insights into the separate components of curriculum and instruction, teacher preparation, and development, but also his insight into the school as a total entity. The school, Goodlad insisted, is not a collection of isolated phenomena—principal, classroom, budget, and so on—but an integrated whole. What Goodlad's work has revealed is for all of the many structural similarities, each school also has a distinctive culture that greatly shapes teaching and learning.

Goodlad has also contributed to debates over moral and civic education, with such coedited works as *The Moral Dimensions of Teaching* and *Developing Democratic Character in the Young*. Goodlad currently directs the Institute for Educational Inquiry, an independent, non-profit corporation based in Seattle, Washington, working to help schools apply his principles of educational renewal.

When it comes to the nature and prospects of curriculum, instruction, and schooling, few names carry the weight of Goodlad, an authority earned through a lifetime of dedication to understanding the resilient and durable place called school.

## GRAMMAR OF SCHOOLING

---

The grammar of schooling is that assemblage of pedagogical routines and principles that students, teachers, and education researchers tend to agree

constitute the process of school-based instruction. Major books and articles on school change and teacher education published over the past decade or two suggest that those practices and structures associated with real school are so firmly entrenched in the imagination and habits of school personnel and parents alike that altering them results in only transient change—or substantive change that is so gradual it is barely noticed.

At once both elusive and a commonplace, the grammar of schooling (also termed *real school*) includes the routines and the physical arrangements of instructional time and space—or at least those common in North American elementary and secondary schools. The term itself is most closely associated with historian David Tyack, who often wrote of it in the early 1990s. In adapting the word *grammar* from the study of language, Tyack described the persistence of such structures as the age-graded, self-contained classroom led by a single teacher and the division of academic knowledge into a half-dozen subjects, all of which are taught in blocks of 20 to 50 minutes dependent upon the students' age (that block scheduling—or periods of an hour or more—is relatively uncommon serves largely to support Tyack's point).

Practicing teachers might add other unchanging aspects of classrooms, such as seating charts, the balance between teacher talk and student discussion, and reliance upon textbooks and publisher-provided materials. Though blackboards have yielded to whiteboards (and occasionally electronic projection systems), maps still pull down in front of them, alphabets and inspirational thoughts line classroom walls, alternating with student projects and travel posters. Whether or not cooperative learning has been instituted in schools, the physical arrangement of desks in classrooms did change markedly from the beginning to the end of the 20th century. In today's schools, group learning is encouraged by the clustering of student desks; whether this has been accompanied by an appropriate amount of interactive instruction is likely in the eye of the beholder.

In writing about the grammar of schooling, Tyack analyzed major efforts to alter the structures and practices of real school, a term he used. Some efforts, such as the age-graded classroom and the Carnegie Unit had been established a century before, and may have become commonplaces

because they were instituted at a time the basic structure of the U.S. public school was still plastic. Other efforts at systemic change, such as those advocated by John Dewey and others in the early decades of the 20th century—practices such as team teaching, sustained efforts to connect learning inside the school with daily life outside it, theme-based curricula driven by student interests, and individualized assessments, for example—did not become common aspects of real school. Is it because the culture of the school and power relationships within the education establishment are counterproductive, as Seymour Sarason would have it? Or is it because the plethora of tried, but not sustained innovations—multigrade pods and flexible scheduling, for example—simply are not as instructionally efficacious as the graded classroom and the Carnegie Unit? Alternatively, have these innovations not been successful chiefly because they require more intellectual energy than teachers have available?

Tyack's arguments suggest that those innovations enabling schools to better serve their democratic purpose have been adopted and sustained. Other innovations, such as the vouchers, charter schools, and rigid standards-based assessments prominent in the first decade of the 21st century—largely driven by a political agenda at odds with the democratic purpose of school—may not be, and in great part because they seem discordant with the public's perception of what real school is all about.

## GRAMSCIAN THOUGHT

---

Antonio Gramsci's (1891–1937) posthumously published prison notebooks launched him as a definitive figure in educational theory and philosophy. In terms of education, though, he is perhaps best known for the development of cultural hegemony. Marxist theorists such as Vladimir Lenin had developed notions of political hegemony, meaning that dominant society maintains control over the working classes through direct force, and had thus called for revolution of the working class. Gramsci, however, believed that direct force was not the only way in which hierarchical systems were created and maintained. Rather, his concept of cultural hegemony asked that society move beyond this notion of rule through direct force and examine how knowledge or ideologies are used to maintain control as well. He asked that people examine the ways in which hegemonic institutions such as schools, churches, the family, labor unions, the press, and so forth all work to present and maintain dominant ideologies as the norm. It was then through normalization, Gramsci argued, that working-class people came to accept these ideologies as common sense. Control, then, could be both direct and ideological. It is important to note, however, that ideological control was not an abstract concept, but was actualized through the lived experiences of the people.

For Gramsci, cultural hegemony was the explanation as to why the socialist revolution had yet to occur, and this theory was also his means of proposing the future of socialism. Indeed, Gramsci argued that hegemony was connected to education, and if the proletariats were to break down dominant ideologies and values, then they would have to look toward education. Education would be the means through which the working class would liberate itself by examining and deconstructing dominant culture and developing or redefining its own culture. As the educational system functioned during Gramsci's era, each new generation of working-class

students was pushed into the same working-class occupations as its parents. In turn, this also meant that the working class consistently lacked the political and social capital of the privileged. In reference to curriculum, Gramsci argued that these educational forms of control were obvious in what schools chose to emphasize as suitable in terms of content and pedagogy. Cultural hegemony was obvious in school relationships in which cultures were valued and in the access to and distribution of knowledge. The educational system valued dominant culture and devalued anything else. As a result, education would have to change to help the working class lift itself out of its current situation through social, cultural, and political enlightenment and power. Reconceiving education should be one of the main goals, Gramsci thought, of the workers' movement.

Gramsci gave people a framework for understanding dominant control both during his time and today. In particular, he moved beyond traditional Marxist theories by expanding notions that control was maintained through direct force. He examined social and ideological forms of control and thus provided society with a means of deconstructing dominant ideologies and moving toward social, political, and economic change, particularly in the school system.

In many ways, Gramsci was ahead of his time. His theories called for education for the working class and thus acted as forerunners to the philosophies of popular educators such as Paulo Freire and Frantz Fanon. In "Socialism and Culture" in 1916, for example, Gramsci compared man to a receptacle ready to be filled with facts, and thus, he highlights the problem that Freire later coins banking education, an issue that many believe still plagues education today. Gramsci believed that education could lead to liberation from one's current social condition. Like Freire, then, he saw education as freedom; Gramsci perceived gaps between theory and practice and between academia and the people, and he worked to bridge these gaps through popular education. He also fought against hierarchical reproductions in schools through early forms of sorting and tracking and argued for education for women. In these ways, he was a man before his time, a man dedicated to democratic education.

## GREENE, MAXINE

---

Positioning herself as an existential-phenomenological educational philosopher throughout her illustrious academic career, Maxine Greene writes, speaks, and teaches about conceptions of freedom, moral choices, and the creation of public spaces that enact possibilities for constructions of just and humane educational communities. Within any contextualization of such communities, Greene argues that engagements with the arts are imperative in the quest for wide-awakeness and that social imagination allows a breaking with the taken-for-granted, a setting aside of familiar definitions and distinctions, a becoming conscious of and responding to diversities of perspectives and identities.

Greene does not situate herself within the field of curriculum studies, per se. However, her vivid and compelling rationale and exemplifications in her own intellectual work of the reasons for doing philosophy influenced and framed efforts to theorize reasons for the field's need to turn away from a technical-rational conception of curriculum and its studies and toward efforts to understand the nature of educational experiences in all their psycho-social dimensions. Greene's own versions of doing philosophy were based in the humanities and incorporated analyses of literature and the arts as means of enacting her visions for education as constant processes of engaging, questioning, choosing,

and becoming. During the reconceptualization of the U.S. curriculum field during the 1970s and early and mid-1980s as well in current iterations of her work, Greene's constant drive to do philosophy bolstered and continues to support curriculum theorizing as necessarily including philosophical and theoretical analyses as integral components of the intellectual advancement of the curriculum studies field, writ large.

Greene, born in Brooklyn, New York, earned her doctorate in education from New York University in 1955 and then taught at New York University, Montclair State College, and Brooklyn College. In 1965, she joined the faculty at Teachers College, Columbia University, the only female among the bastion of male philosophy of education colleagues. She currently holds the William F. Russell Professor in the Foundations of Education (emerita) at Teachers College. In 2004, the Teachers College Trustees created the Maxine Greene Chair for Distinguished Contributions to Education.

Among her outstanding and numerous awards and honors, her election to the office of President of the American Educational Research Association (AERA) indicated the high esteem in which her colleagues within the whole diverse field of educational research held her. Indeed, for a predominately social science and quantitative research oriented membership to endorse her AERA presidency is of special note. Greene also was elected president of the Philosophy of Education Society, the American Educational Studies Association, and the Middle Atlantic States Philosophy of Education Society.

Greene also has been awarded the Medal of Honor from Teachers College and Barnard College, Educator of the Year Award from Phi Delta Kappa, the Scholarly Achievement Award from Barnard College, and AERA's Lifetime Achievement Award; and she received a Fulbright fellowship to New Zealand.

As Philosopher-in-Residence of the Lincoln Center Institute for the Arts in Education (LCI) since 1976, Greene conducts workshops, especially in literature as art, lectures at LCI's summer sessions, and her intellectual work has inspired the creation of a small high school, the High School of Arts, Imagination and Inquiry in association with LCI and New Visions for Public Schools. She founded the Maxine Greene Foundation for Social Imagination, the Arts, and Education in 2003.

Greene, widely acclaimed as one of the preeminent educational philosophers in the history of the education field, writ large, continues to write and speak in a distinctive and literary voice that offers the keen and poetic sensibilities of a novelist, the astute questions, critiques, and insights of a philosopher and historian, and the soul of an activist who works tirelessly for change and betterment in the project she calls education. That project—conceived in terms of Jean-Paul Sartre's notion of freedom as individuals having to constantly make choices, and indeed not being able to avoid making choices—requires that teachers and students engage in activities of meaning making, dialogue, and reflective understanding not only of school-sanctioned knowledge generically known as the curriculum, but also of the texts of their social realities.

The projectness of education, fueled most compellingly by imaginative encounters with the arts, thus requires intentional, cooperative, and never ending engagement, and takes place and shape within particular, diverse, cultural and social contexts as well as historical moments.

### Freedom and Choice

Greene argues that any attempts to attend mindfully to one's own life, to make sense of actual lived educative situations, to make choices, always will be enacted in response to individual as well as social and cultural texts—the curricula of social realities, if one will—that often are unpredictable, unrepeatable, and filled with multiplicity and difference.

Throughout her work, Greene emphasizes that whenever individuals make choices with values and preferences in mind, they are engaging in moral choices that are framed by norms and rules of a particular society, personal histories, and integrated customs functioning within a specific social/cultural context. Choices are free only when made by people who are aware of options, who recognize that more than one possible action exists in any one particular moment and context. The challenge is to strive in every moment to be wide awake, even in the face of conflicting and fluctuating views of the good and the right. Influenced by John Dewey, in particular, Greene argues that intelligent and diligent inquiry into the worth or goodness of a particular educative action or version of curriculum, for example, is crucial to the

value of a final choice or decision. Freedom, then, does not mean absence of responsibility. Individuals can be free only when they accept responsibility for not only their own, but also others' experiences of the world.

In the educational world, Greene's work points to individuals' conceptions of and encounters with various versions of what counts as worthwhile knowledge—typically encapsulated as the curriculum—as of primary importance. Curriculum developers—at particular historical moments and contexts, teachers, and even students have accepted this as an educative responsibility—as well as designers, theorists, researchers, evaluators must approach, question, and accept responsibility for all aspects of creating, theorizing, and engaging in particular knowledge constructions.

### The Arts, Imagination, and Aesthetics in Education

The arts, for Greene, provide a means by which students, still in the relatively sheltered atmosphere of a classroom or arts setting, can prepare for a bombardment of choices, interpretations, and complex dimensions that will confront them as they move into larger, maturing attempts to make sense of their own and others' lives. The place of the arts in education is twofold: Possibilities are offered through engagement with works of art that might enable teachers and students to grapple with the changing meanings of human realities and time in ways that mere description cannot, and experiences with the arts offer possibilities for self-confrontation, for increasing awareness of the multiplicities of self and other, and for making individuals more visible to themselves.

Drawing on works of imaginative literature, in particular, but also staging encounters with classical as well as avant-garde forms of dance, music, visual arts, popular culture, and multimedia, Greene partakes in both performance and the doing of philosophy in relation to the study of aesthetics and the arts and their crucial relationships to education. In so doing, she reminds curriculum studies participants that engagement with works of art can move people to critical awareness, to a sense of moral agency and to a conscious engagement with the world, and is central to any construction or version of curriculum.

### Coda

Greene, still actively teaching, lecturing, and publishing into her 90s, lives her passion for and commitment to keeping alive the sense of possibility, the constant challenge to both interrogate and illuminate interior and exterior moral journeys of the self in relation to others, and the willingness to risk—without any guarantees. She lives these through her activism as well as through her immense contributions to and leadership within education. Greene stands as a premier contributor to curriculum thought and action in the world, and her commitment to doing philosophy continues to inspire generations of curriculum studies scholars and practitioners.

## GROUNDING THEORY RESEARCH

---

Grounded theory research is the observation of a naturalistic setting and the development of images and ideas—concepts, hypotheses, and theories from these observations and data. This form of research serves to guide or provide a theoretical foundation for much qualitative research in the

field of curriculum studies. The observations may include talking to individuals, including interviews, and collecting documents. Several methodological differences from traditional, positivistic, and quantitative approaches to inquiry are important. Usually the researcher is more interested in the front end of research—creating ideas rather than testing or verifying ideas. The data typically are qualitative in contrast to more quantitative data gathered in laboratory experiments or with questionnaires. Within social science, this approach was initially accented and labeled by sociologists Barney Glaser and Anselm Strauss in 1967, *The Discovery of Grounded Theory: Strategies for Qualitative Research*. In contrast to this simplicity, the more complex version of grounded theory is Antony Bryant and Kathy Charmaz's 2007 *Handbook of Grounded Theory* containing 600 pages with three dozen authors. The authors, many from United Kingdom and other countries besides the United States, often were trained by, or associated with, Glaser or Strauss. They are mostly sociologists and social psychologists in various universities and professional settings, but rarely in professional education or curriculum.

Considerable research involving grounded theory in curriculum studies, the field of education, and closely related fields appeared before the label was invented or before it was widely known or recognized. For example, the grounded theory tradition was formed by natural historian Charles Darwin's *The Origin of Species* whose 1859 work during his voyage on Her Majesty's ship *Beagle* underlies the structure of most general biology texts as well as the organization of the educational exhibits of the Museum of Natural History. Social workers Fritz Redl and David Wineman's 1953 publication, *The Aggressive Child*, represented grounded theory work with children at Pioneer House and developed concepts and theories for residential treatment centers is fundamental to social work curriculum. Other examples of ground theory work include Carl Rogers's *Counseling and Psychotherapy*, a book based on counseling interviews that developed the theory of nondirective counseling and altered counseling programs across the country, and Donald Schon's *The Reflective Practitioner*, a publication that changed the paradigm strategies of curriculum and instruction of

practitioners in many fields. The grounded theory research of Louis Smith and William Geoffrey in *The Complexity of an Urban Classroom* developed narratives and models of classroom activities and teacher–pupil interactions and contributed to the teaching of educational psychology and principles of teaching. Finally, geometry teacher Harold Fawcett's *The Nature of Proof*, although an educational experiment that occurred within the auspices of the Progressive Education Association's Eight Year Study, involved secondary school pupils developing a grounded theory of geometry.

In the 1930s, Fawcett taught a high school geometry class in which the pupils discovered the importance of the concepts of definitions and assumptions. During the year, they worked from problems and exercises where they arrived at terms and concepts defined by pupils. A major point of Fawcett's geometry class was his intention to have students think about nonmathematical arguments, the classical issues of transfer of training. High school students were developing grounded concepts, hypotheses, and theories of geometry and the usefulness of these ideas in other complex human situations and thought.

Smith and Geoffrey's 1968 publication, *The Complexity of an Urban Classroom*, is subtitled *An Analysis Toward a General Theory of Teaching*, and details from their educational perspective show the procedures they used in generating grounded theory. Their collaboration involved Smith as outside observer and Geoffrey as classroom teacher. They talked to each other daily before school at a coffee shop in what became a never ending interview of each other. Smith took field notes from his seat at the back of the classroom and talked to pupils in between lessons, at lunchtime, and on the playground. Besides accounts of lessons and teacher–pupil conversations, the notes contained what they called interpretive asides. Without quite realizing it at the time, these were initial reaches for concepts and hypotheses of what was occurring. Smith talked with teachers at a midmorning recess coffee break in Geoffrey's classroom where they had set up a coffee bar. They each had a tape recorder for observations and interpretations recorded going to and from the school and later at home. In effect they were developing curriculum for teacher education classes. This project

represented a form of grounded theory several years before Glaser and Strauss published their seminal work.

The history of grounded theory vies with the paradigmatic effects of researchers in positivistic, interpretive, critical, feminist, and racial/ethnic traditions. Differences exist in the more concrete grounded theory procedures of sampling, data collection, coding, category development, memo writing, and relation to subjects/participants. In brief, excitement and creative possibilities exist everywhere in grounded theory practices and results. The area keeps growing and changing.

## HABERMASIAN THOUGHT

---

Jürgen Habermas (1929– ) dedicated his energies to reestablishing reason as the driving force behind both democracy and communication. In *Knowledge and Human Interests*, appearing in the United States in 1971, Habermas claimed that all knowledge is constituted in human interests, and he named three such interests: control, interpretation, and emancipation. The interest in control, he said, is dominated by positivism and governs science and technology. The interest in interpretation governs hermeneutics and human interaction, and interest in emancipation, Habermas said, would govern a psychological and social science dedicated to promoting the liberty of individuals in particular and society in general. Habermasian thought provided a theoretical base for North American curriculum theorists to critique the organizational structures of education and to analyze and then develop alternative conceptions to lessen the hegemonic control of public knowledge and educational programming.

Habermas's scheme was highly evocative and moved James Macdonald, one of the leading curriculum theorists of the 1970s and a founding figure in the reconceptualist movement, to recognize three models of curriculum development: the linear expert model, the circular consensus model, and the dialogical model. The linear expert model is a highly centralized and positivistic curriculum development model based on the authority of subject matter specialists. The circular consensus

model, on the other hand, is highly localized and depends upon the notion that curriculum functions best when the teachers are the main curriculum makers, consulting from time to time with curriculum experts. For the dialogical model, Macdonald referred to the work of Paulo Freire, whose literacy campaigns were grounded in the political interests of the learners as they engaged in dialogue with each other and the literacy workers. Macdonald's work has had significant influence on some members of the reconceptualists.

Habermas was born in Düsseldorf, Germany, in 1929, and became one of the most important philosophers and social theorists of the late 20th and early 21st centuries. Growing up in Nazi Germany, and coming into adulthood in the post-war period, Habermas, a member of the Frankfurt School, became committed to a philosophical and social-theoretic understanding of deliberative democracy and communicative rationality, both of which had been denied him growing up under national socialism.

One of the problems with Habermas's theory is that he assumes all science is positivistic and primarily interested in control, an assumption that is true of some science, but not all. For example, when Jane Goodall lived among chimpanzees and observed them naturalistically, her inquiry was not so tightly controlled. Further, one is hard put to discern precisely what specific kinds of knowledge are constituted by the interest in emancipation. Yet the force of Habermas's insight in *Knowledge and Human Interests* remains relevant to curriculum studies, for it clearly points to the problematic domination of

the positivistic linear expert model in curriculum practice. Moreover, it demonstrates a way to resist such domination by affirming the value of knowledge generated by interpretation, conversation, and commonsense practical knowledge.

The domination that Habermas opposes is neither capitalism nor communism; it is the contemporary positivistic mind-set that the only knowledge of value is scientific-technological. For this reason, Habermas, in the 1970s, turned to the study of the practical language of everyday life. In conversations, he noted, people sometimes act strategically, pursuing their own private interests. At other times they act communicatively, pursuing understanding or consensus. This kind of conversation gets raised in Habermas's terminology to discourse when partners in a conversation provide reasons for claims they make. These reasons are not limited to representations of facts, but may be based upon the rightness of reasoning among partners or on moral correctness, aesthetic value, personal sincerity, or on other considerations. In this sense, Habermas's discourse theory can be compared to the work of informal logicians, such as Stephen Toulmin, who find reasonableness, as distinct from logical rationality, a significant source of practical knowledge.

Curricula that engage students in retrieving, critiquing, rethinking, and reconceptualizing the traditions that have formed our civilization would be consistent with Habermas's philosophy. Such curricula would engage students in conversing about what and whose interests are being served by claims made in the texts they study. Habermas would consider this kind of rational dialogue a necessary condition for the deliberative democracy he advocates.

## *HANDBOOK OF RESEARCH ON CURRICULUM, THE*

---

*The Handbook of Research on Curriculum* (1992), edited by Philip Jackson, was a project of the American Educational Research Association. This handbook and its successor *The SAGE Handbook of Curriculum and Instruction* (2008) are the principle resources for comprehensive research reviews of curriculum studies. This volume has 1088 pages, 34 chapters, 52 authors, a nine-member editorial advisory board, and a name index of approximately 5000 entries. The handbook's purpose was to give conceptual and methodological definition to curriculum studies while also reviewing past achievements. It is organized into four parts:

- Part 1: Conceptual and Methodological Perspectives
- Part 2: How the Curriculum Is Shaped
- Part 3: The Curriculum as a Shaping Force
- Part 4: Topics and Issues Within Curriculum Categories

To establish commonality among chapters with widely different content, authors were instructed to consider four matters:

1. to provide a historical perspective on the topic,
2. to provide the best scholarly and empirical knowledge on the topic,
3. to provide a comprehensive bibliography on the topic, and
4. to provide ideas on future research directions for the topic.

Though none of the chapters are organized according to these directions, each is found in the chapters. The second, third, and fourth guidelines are thoroughly achieved in Parts 1, 2, and 3. Because each curriculum subject matter area has its own professional associations and journals, the chapters in Part 4 provide limited bibliographies compared to what is available in each area. The strength in these chapters lies in the second and fourth guidelines by providing an overview of

knowledge and future directions. The first guideline, on historical perspective, is treated differently from chapter to chapter. For those chapters where an historical perspective was developed, the chapters remain one of the best historical sources for the topic, for example, in Chapter 5, “Curriculum Evaluation and Assessment”; Chapter 10, “Conceptions of Knowledge”; and Chapter 14, “Teacher as Curriculum Maker.”

The five chapters of Part 1 deal with conceptions of curriculum and curriculum specialists, the scientific tradition, the humanistic tradition, methodological issues, and curriculum evaluation and assessment. At one time, curriculum studies had an atheoretical reputation expressed in teaching and curriculum development methodology studies. A significant feature of the handbook is the theoretical scope that characterizes Part 1. Part 1 helped legitimize the diversity of conceptual curriculum thought and helped shape the direction of the field.

Parts 2 and 3 are organized by two broad purposes of education: transmission of society’s knowledge and values *and* transformation of society’s knowledge and values. However, individual chapters do not answer well to the contextualizing questions: How is curriculum shaped by society? And how is society shaped by curriculum? The importance of those two parts is that the range of topics discussed broadens the field of curriculum studies beyond general curriculum and curriculum theory.

Part 4 is on curriculum subject matter. Ten subject matter areas are represented: writing and reading, literature and the English language arts, mathematics, science and technology, social studies, foreign language curriculum, vocational education, art education, physical education, and the extra curriculum. These chapters reflect a school-based conception of curriculum organized by school subject matters. This organization has the advantage of providing insights into what the schools do, but has the disadvantage of obscuring critical alternatives to existing curriculum structures. The section does not deal with the traditional school curriculum questions of time assigned to a subject, balance among the subjects, and sequence throughout the age-grade years. The chapters focus on school subject matter rather than on disciplinary subject matter and in varying degrees give historical background for each subject. This perspective

distinguishes the chapters from teaching method reviews of the subjects.

Jackson’s overview chapter, “Conceptions of Curriculum and Curriculum Specialists,” gives a historical and conceptual summary of the field. He discusses emerging theoretical directions and reviews the debates on their relevance to the field. The chapter raises issues, problems, and potential worth reading even now. This handbook and Jackson’s essay were primary points of reference for *The SAGE Handbook of Curriculum and Instruction*.

## HEALTH EDUCATION CURRICULUM

---

The school health education curriculum guides classroom instruction in Grades K–12 on topics such as nutrition; prevention of tobacco, alcohol, and drug use; and stress and conflict management. Certified health educators develop age-appropriate and sequential lessons emphasizing personal and social responsibility to enhance youth and family health. There is a growing body of research examining effective content of health instruction, pedagogy, and assessment of student outcomes.

#### Coordinated School Health Program

The U.S. Centers for Disease Control and Prevention (CDC) identified six priority areas to improve adolescent health: poor eating habits, physical inactivity, tobacco use, behaviors that result in intentional or unintentional injuries, abuse of alcohol and other drugs, and sexual behaviors that result in

unintended consequences. The CDC promotes adoption of a coordinated school health program (CSHP), an integrated, sequential, and age-appropriate health and physical education curricula within a healthy school environment. Additional components include school nutrition services, counseling and social services, student health services, school-site health promotion for faculty and staff, and family and community involvement. Full implementation of a CSHP in U.S. school systems will address the six priority areas. There is room for improvement, as true CSHPs have not been implemented in a majority of U.S. schools. More common are several components of a CSHP, for example, health and physical education, health screenings, and individual guidance. Annual school improvement plans may contain goals to enhance student health.

Although health education and physical education are complementary disciplines, each has a distinct purpose. Physical educators teach knowledge and skills for lifelong physical activity, regardless of ability level. Quality health education provides opportunities for students to acquire health knowledge, develop attitudes, learn behaviors, and practice skills. Student outcomes include improved physical, mental, social, and emotional health. In addition, students contribute to health of family and peers through school and community service projects, for instance, recycling aluminum, plastic, and paper. Both health and physical education are essential components of the CSHP and will enhance development of productive and healthy adults.

### Who Should Teach Health Education?

Insufficient training in health education curriculum studies and the lack of quality informational resources are obstacles to overcome. The CDC reported in 2006 that most states (94.1%) provided health education staff with the opportunity to receive some form of a certification, licensure, or endorsement to teach health education. However, less than half of school districts require health education teachers to be certified, licensed, or endorsed in the discipline of health education.

In addition, a school district or system coordinator should oversee curriculum development, implementation, and evaluation, as well as organize professional development for teachers. Unfortunately,

the CDC found that less than one fourth of states require each district to appoint a coordinator or supervisor of health education.

State education agencies issue credentials in the form of teaching certificates or licensure for health education teachers. These agencies are also responsible for establishing health curriculum guidelines for classroom instruction. National and state professional organizations are engaged in the process of reviewing and revising discipline-specific certification standards. The National Council on Accreditation of Teacher Education (NCATE) accredits schools, colleges, and departments of education. The American Alliance for Health, Physical Education, Recreation, and Dance and its member organization, the American Association for Health Education, oversee the NCATE health education accreditation process.

Individual health education teachers may seek the Certified Health Education Specialist credential awarded by the National Commission on Health Education Credentialing Inc. The credentialing process recognizes high-quality professional preparation and continuing education programs within the discipline.

The National Board for Professional Teaching Standards added a voluntary certificate in health and early adolescence through young adulthood beginning in 2007 to recognize exemplary health education teaching. Eleven standards guide teachers to improve student achievement. Standards may be grouped into three tasks (preparing, advancing, and supporting student learning). Preparing for student learning includes knowledge of students, health subject matter, promoting skills-based learning, and curricular choices. Advancing student learning includes effective approaches to health instruction, implementing high expectations for all learners, assessing outcomes, and ensuring equity, fairness, and diversity. Supporting student learning includes collaborating with families and the community, advocating for the discipline, and professional growth.

### Moving From Individual to Collective Concerns

The emphasis of the second edition of the *National Health Education Standards* published in 2007 is development of health-literate citizens. Health literacy is defined as the ability to obtain, interpret,

and apply health information, and access and utilize health services to enhance personal health. As of 2006, 75% of states mandated school districts or schools to implement national or state health education standards. Many states use the national standards to develop a local curriculum framework or guidelines.

Educators use performance indicators within the national standards to guide health lessons for students in Grades PreK through 12. The aim is to enhance personal, family, and social health through acquisition of general and specific health knowledge, health-promoting attitudes, and health skills. For instance, students in Grades 6 through 8 will exhibit the ability to refuse risky behaviors and negotiate healthy actions. High school students will work together to enhance personal, family, and community health.

Educators facilitate student-led health advocacy projects, such as a teen antismoking or responsible driving campaign. There are many opportunities to collaborate with local nonprofit agencies and health organizations for cooperative instruction, for instance, Hoops for Heart and Jump Rope for Heart sponsored by the American Heart Association. Proceeds of these national campaigns fund school equipment and facilities for physical education in schools.

Health education teachers use a variety of methods for health instruction. According to the CDC, the most popular methods are group discussion, cooperative group activities, audiovisual materials, role playing or simulations, and visual, performing or language arts. For instance, the teacher may distribute a selection of solar reactive pony beads and silk cord or jute for students to craft bracelets. Demonstrate how the colors of beads become brighter when exposed to sunlight. Apply sunscreen to one bracelet to emphasize how beads do not change color when protected. This activity is useful to teach the performance indicator for Grades 3 through 5; students will explain the connection between healthy behaviors and personal health.

### **Progression From Didactic Instruction to Teaching Health Skills**

Three levels of factors contribute to selecting healthy behaviors: predisposing, reinforcing, and enabling factors. These factors are compatible

with Benjamin Bloom's three domains of educational activities—that is, cognitive or knowledge, affective or attitude, and psychomotor or skills—and form the basis in the *National Health Education Standards*.

Predisposing factors include health-related knowledge, attitudes, beliefs, and behaviors. Examples include perceptions of personal responsibility to prevent unplanned pregnancy and the belief that adequate sleep is a healthful daily activity. National Health Education Standard 1 emphasizes concepts that promote health and prevent disease. One performance indicator for Grades 6 through 8 is to study the probability of injury or illness if involved in unhealthy behaviors.

Reinforcing factors include positive and negative feedback received from family, friends, and others following a health behavior. Examples include encouragement from a teacher or peer to choose healthy foods in the cafeteria and pressure from peers to try a cigarette or an illicit drug. National Health Education Standard 8 emphasizes the importance to advocate for personal, family, and community health. One performance indicator for Grades 9 through 12 is to persuade others to make positive health choices.

Enabling factors include supportive policies and rules of groups, organizations, and institutions that promote opportunities for healthy actions. Examples include permitting student athletes to wear sunglasses and hats during afternoon practice as an exception to the school dress code and installation of a shade structure above an outdoor playground. Health Education Standard 2 focuses on the analysis of family, peers, culture, media, technology, and other influences on health behaviors. One performance indicator for Grades PreK through 2 is to recognize how the family guides personal health practices and behaviors.

The CSHP includes planned focus on all three levels of factors, for instance, including parents, older students, health professionals, and other partners on a school wellness committee as required in U.S. Senate Bill 2558 (which was never passed into law). The purpose of this bill, also known as the HeLP America Act, was to reorient the Nation's health care system toward prevention, wellness, and self-care. Title I—Healthier Kids and Schools mandates establishment of wellness committees and policies within local schools that receive federal

funds for child nutrition programs. Nutrition education is an expectation.

Several states, regions, and school systems across the United States implemented consortia or collaborative action teams to improve school health programs. Consortia members are parents, teachers, business and industry professionals, government officials, university faculty, and health service providers who establish and achieve goals. These goals include studying the current health curriculum, advocating for healthier policies, applying for funding for health programs, and providing school staff continuing education opportunities related to health education.

### Characteristics of an Effective Health Education Curriculum

The CDC identified characteristics of effective health education curricula in 2008, including (a) provide information, learning strategies, teaching methods, and materials that are age and developmentally appropriate; (b) focus on specific health goals and related behavioral outcomes; (c) emphasize behavioral theory and research base that is evidence of effectiveness; (d) stress individual values and group norms that support healthy actions; (e) focus on increasing perceived risk of harm for unhealthy behaviors and reinforcing protective factors; (f) address social pressures and influences on decision making; (g) build personal and social competence and self-efficacy by teaching health skills and providing practice opportunities; (h) provide functional health knowledge that is basic, accurate, and directly contributes to health-promoting decisions and behaviors; (i) personalize information to engage students; and (j) incorporate learning strategies, teaching methods, and materials that are culturally inclusive.

Bettina Lankard Brown concluded that experiences such as service learning are often required for secondary and college students. Service learning is an educational technique that enhances learning by combining community service, academics, and civic duties. Service learning is compatible with general and discipline-specific educational standards. The national education goals for the year 2000 emphasized preparing students for responsible citizenship. These goals include providing a disciplined learning environment with campuses

that are free of drugs, violence, firearms, and alcohol and involving students in community service activities.

CDC's Health Education Curriculum Analysis Tool (HECAT) is a free resource to guide health curriculum selection and development. Teachers, curriculum coordinators, and wellness team members may assess the existing curriculum and plan improvements to promote healthy behaviors among students. The HECAT is compatible with a CSHIP and the *National Health Education Standards* for schools.

### Examples of Using Health Curricula to Reduce Childhood Health Threats

Numerous examples of innovative health curricula implemented in school and community settings for primary prevention of disease and illness have been published. Two studies illustrate promising results from a comprehensive approach. Ardis L. Olson and colleagues developed a sun protection program, *SunSafe in the Middle School Years*, guided by Albert Bandura's social cognitive theory and Ronald Rogers's protection motivation theory. The randomized controlled trial was conducted in 10 northeast communities. Adults and student peers served as role models who actively promoted sun protection practices. Sun teams within schools educated groups of teens about sun safety and led students in peer-led activities promoting healthy actions. Teachers, school staff, coaches, and parents modeled sun protection behaviors. Project staff observed 1,927 students in Grades 6 through 8 annually to assess health behavior changes, including percentage of body surface protected from the sun by clothing, sun-screen, or shade. Results revealed significantly greater body surface protection among adolescents in intervention communities as compared to controls.

Researchers evaluated *Safer Choices*, a multifaceted, theory-based HIV, sexually transmitted diseases (STDs), and pregnancy prevention program to determine whether unprotected sexual intercourse decreased among senior high school students. The program was implemented in 20 large urban school systems in California and Texas; schools were randomly assigned as treatments or controls.

Researchers examined changes in student sexual risk taking, school climate supporting HIV/STD and pregnancy prevention education, and psychosocial variables, such as knowledge about reproductive health, as a result of the randomized study. Students who received the educational program were significantly less likely to engage in unprotected intercourse and more likely to use a condom at 19 months. Knowledge of HIV and STDs, perceived ability to abstain or use condoms, peer support for condom use, and parent communication were significantly greater among *Safer Choices* students at 19 months. Behavioral effects related to the primary goal persisted at 31 months. Student assignments requiring parent interviews about HIV-STD and pregnancy prevention, newsletters, and adult learning activities fostered parent-child communication.

Health curricula implemented in classrooms with extension activities to engage parents and community agencies enable students to assume responsibility for personal health and wellness. Students learn through direct experience and collective action to become self-advocates. Qualified health teachers facilitate students' inquiry and decision-making skills, thus attaining the goal of developing health-literate citizens.

## HEALTH EDUCATION CURRICULUM, HISTORY OF

---

Health education curricula have evolved from a limited focus on personal hygiene and prevention of communicable diseases to voluntary adoption of healthy habits to enhance quality and quantity of life. State and local government authorities establish minimum guidelines for age-appropriate and sequential health content for PreK through secondary grades. Health curriculum content areas include a focus on the health of the individual across the life span, family, peers, and society. Topics include consumer health, sexuality, mental and emotional health, injury prevention and safety, nutrition, disease prevention and management, and substance use and abuse.

### Health Education Curriculum Development

Critics of health education prior to the 20th century noted that most educators were poorly prepared and delivered insufficient content despite a large number of available texts. Beginning in the 19th century, professional organizations (National Education Association; Black American Teachers Association; American Public Health Association; American Association of School Physicians, later known as the American School Health Association; and others) advocated for professional preparation of teachers, workers' rights, and improving welfare of U.S. families. Improving the welfare of families included teaching students about health and identifying health problems. The American Association for the Advancement of Physical Education promoted necessity of conducting physical examination of children and including health instruction in school curricula.

Thomas Denison Wood was an advocate, philosopher, and scientist who designed one of the first preparation programs for health and physical educators at Teachers College of Columbia University. The National Education Association and American Medical Association formed the Joint Committee on Health Problems in Education chaired by Wood. The committee's work included enhancing health and welfare of children attending rural schools and promoting quality preparation programs for health teachers across the country through published guidelines.

The Committee on Wartime Problems of Childhood documented family poverty, child malnutrition, communicable disease, and premature death, leading to the formation of the Child Health Organization (CHO), a new national agency. The CHO launched a nationwide campaign to improve the health standards of U.S. children with L. Emmett Holt, a noted pediatrician and author, as its champion. Campaign messages encouraged school administrators and teachers to increase the focus on health in the curriculum and stimulate active participation by students.

A White House Conference on Child Welfare convened in 1919 by President Woodrow Wilson prompted development of national standards for health curricula. Conference outcomes were recommendations for a compulsory course to teach child hygiene in public schools and enhanced child health screening and treatment of vision, hearing problems, and communicable diseases, estimated by Wood to affect as many as three fourths of U.S. school children. Health essentials to be taught to children and their parents included adequate nutrition, importance of sleep, suitable clothing, exercise for physical development, sex hygiene, and reproduction.

Health education achieved peak interest among educators, scientists, and school administrators by mid-20th century. The American Physical Education Association, later known as the American Alliance for Health, Physical Education, Recreation and Dance, recommended changes in related terminology, moving away from medical inspection, and hygiene and health supervision, with a new emphasis on developing personal health habits for a lifetime. This recommendation was a distinction between the role of the teacher and the school

physician. School health curricula included basic facts and concepts about personal and social health, a stimulating learning environment, and guided student activities to practice healthful behaviors taught by trained educators. There was a new emphasis on using social and behavioral science to measure changes in health knowledge and habits as a result of classroom pedagogy.

A recent major development in U.S. health curricula was the release of the *National Health Education Standards: Achieving Excellence* issued by The Joint Committee on National Health Education Standards in 1995. The second edition was published by the American Association for Health Education in 2007. Both documents provide guidelines for what students should know and be able to demonstrate and are useful to develop health lessons and assess instructional outcomes. The central concept is building health literacy or the ability to access health information and services and apply these to improve personal, family, and community health.

The eight national standards for instruction emphasize active application of knowledge for healthy decision making in Grades PreK through 12: (1) comprehend concepts related to health promotion and disease prevention to enhance health; (2) analyze the influence of family, peers, culture, media, technology, and other factors on health behaviors; (3) demonstrate the ability to access valid information and products and services to enhance health; (4) demonstrate the ability to use interpersonal communication skills to enhance health and avoid or reduce health risks; (5) demonstrate the ability to use decision-making skills to enhance health; (6) demonstrate the ability to use goal-setting skills to enhance health; (7) demonstrate the ability to practice health-enhancing behaviors and avoid or reduce health risks; and (8) demonstrate the ability to advocate for personal, family, and community health.

### Curriculum Studies of Health Instruction

In the past, candidates for teacher certification completed few courses with content about pedagogy for health education. It was assumed that all teachers needed a basic understanding of health and the human body. Today, states certify health

and physical education teachers as separate disciplines. Health curriculum studies examine effectiveness of informational content, promotion of healthy attitudes, and skill-building activities to yield health-literate citizens. The Centers for Disease Control and Prevention (CDC) provide funding and technical assistance to states to conduct surveillance of six critical behaviors that compromise the health of children and adolescents and modify unhealthy habits through planned programs. The six critical behaviors include alcohol and drug use, injury and violence, tobacco use, nutrition, physical activity, and sexual risk behaviors. According to the CDC, these behaviors are usually established during childhood, persist into adulthood, are interrelated, and are preventable. In addition to causing serious health problems, these behaviors also contribute to the educational and social problems that confront the nation, including failure to complete high school, unemployment, and crime. There is a growing body of research examining how health behavior theory guides instruction within and outside of the classroom.

## HEGEMONY

---

Hegemony in its original sense denoted the domination of one nation over another. However, its more complex and more common meaning is associated with the work of Marxist philosopher Antonio Gramsci. His concept of cultural hegemony speaks to how one social group maintains domination over another social group. In the field of curriculum studies, hegemony in this sense has been used to explore and explain the role of various curricula in ensuring the domination of White, middle-class, heterosexual, and male worldviews.

In trying to figure out why the workers' revolution predicted by Karl Marx and Friedrich Engels had not occurred, Gramsci proposed the concept of cultural hegemony to explain how—in a diverse society—one social group maintains domination over another social group. Key to Gramsci's theory is the idea that domination is maintained not simply by force (i.e., military might), but primarily through power, or the ability of the dominant group to persuade the subordinate group to adopt its values, beliefs, and ideas. In other words, the dominant group must use ideological persuasion to gain the consent of the subordinate group. In an advanced capitalist society, the primary ways in which the values, beliefs, and ideas of the dominant group are circulated and reinforced are through mass media and schooling. Because it is so widely and so readily circulated, the dominant ideology is assumed to be neutral and thus has a powerful impact on shaping everyday common sense. Hegemony is thus achieved when the majority of the subordinates accept the dominant ideology as the way things are and as such think and act in ways that are consistent with the status quo.

In educational studies, the concept of hegemony has been central to critical analyses that—despite the rhetoric around equal educational opportunity—argue that schools actually work to reproduce society's existing power relations. At the same time, there has been much critique and elaboration on the critical role of ideology and how it is that the masses come to accept and/or reject the values, beliefs, and ideas of the dominant social group. The assumption that the masses are simply duped into accepting the ideology of the dominant social group or class has been challenged by a

number of more sophisticated analyses that look at—for instance—student resistance as a way of rejecting the dominant ideological perspectives communicated via the official school curriculum, the ways in which the dominant social group connects its ideological agenda to the lived experiences of people as a way to redirect popular will in their favor, and the idea that hegemonic order as well as social change depend on a combination of reproductive and democratizing forces and that schooling is central in relaying—despite their contradictions—both scripts.

In the field of curriculum studies, considerations of hegemony hinge on the idea that the knowledge conveyed through various curricula is not neutral or disinterested; it raises questions of what knowledge gets included, how that knowledge is transmitted, and whose interests are being served by such knowledge. Efforts to understand curriculum as one of the primary apparatuses through which ideological consensus is worked on via schooling has provoked a proliferation of meanings for the concept of curriculum, including official curriculum, hidden curriculum, null curriculum, curriculum as difference, lived curriculum, and informal curriculum, among others. Scholarly endeavors in the field also speak of hegemony in more than capitalist class terms; there is also significant focus on the impact of race, gender, and sexuality on the power relations that work toward and/or against the current hegemonic order. In addition, there has been a growing body of work where curriculum studies intersects with cultural studies to consider the role of mass media and popular culture in maintaining and/or disrupting the current hegemonic order.

A solid understanding of hegemony begs the question of how a hegemonic stronghold can be disrupted. In an advanced capitalist society, the principal way to work toward counterhegemony is for counterhegemons to use propaganda and other forms of ideological persuasion to convince the masses to share their critiques of the current order, which can then be overthrown either through violence or democratic processes. A number of endeavors in the curriculum field posit education—not necessarily schooling—as key to working toward counterhegemony or dismantling the current configuration of power relations in society. Critical pedagogy, feminist pedagogy,

critical race pedagogy, queer pedagogy, and liberatory pedagogy are but a few of the critical discourses raising awareness about and thus challenging the various hegemonic relations reinforced through current curriculum politics and practices.

## HERMENEUTIC INQUIRY

---

The English word *hermeneutics* is derived from the ancient Greek *hermeneutike*, meaning interpretation. First used by Plato (427–347 BCE) in the *Politicus*, it was usually linked with another word, *mantike*, meaning divination. These words were linked because an act of interpretation was regarded as necessary for translating divine messages from oracles and omens. Insofar as such messages were usually mysterious, they required intermediary interpretation to be rendered understandable. The basic assumption, then, of all hermeneutic endeavor is that there is always a difference between what is said (the surface phenomenon of language) and what is meant (the fuller range of possible meanings contained within the surface phenomenon). Because all educational practices, including curriculum, are mediated through language, they are subject to interpretation.

But what does it mean to interpret? This entry examines how that question has been answered historically in the Western tradition, from the classical age through to the contemporary situation.

Hermeneutics always stands in tension, often conflict, with the desire to secure and fix meaning once and for all. The aim of hermeneutics, however, is never simply to spin one interpretation after another in an endless play of possibilities. Instead, the purpose is to lift that burdensomeness of events, texts, and sayings that pertains when the original question that called them into being has been forgotten, rendering present practices as alienating and estranging. Contemporary hermeneutics operates largely in the shadow of German philosopher Hans-Georg Gadamer (1900–2002) who suggested that creative interpretation begins with a query: What is the question for which this (event, text, saying) is the answer? Recovering the originating question in turn enables a reconsideration of whether conventional responses to it are currently relevant. The purpose is never to dismiss convention, or orthodoxy, but to ask for their capacity to sustain things in the present in such a way that allows human life to go on, creatively. The Greek god from which the word *hermeneutike* received its character was Hermes, known for eternal youthfulness. Therefore, hermeneutics is particularly relevant to education and curriculum studies through its capacity to protect the conditions for young people being able to live and learn in an atmosphere of creative vitality.

### Hermeneutics in the Classical Age

Before the advent of writing, the age of orality, words were always connectable to a speaker. This connection enabled the meaning of speech acts to be relatively transparent, as hearers could deduce meaning from body language, tone, and commonly shared expressions. Hermeneutics, as a formal investigation of how meaning arises in communication, essentially became necessary only with the advent of writing because writing removed the requirement of a speaker being present for thoughts and ideas to be conveyed. But as Plato argued in the *Phaedrus*, writing is responsible for a kind of double alienation, which he called its peril. The peril of writing is twofold. In removing the requirement of the original speaker, words rendered as texts are easily subject to interpretations that the original speaker never intended. Furthermore, in removing words from their spoken context, those (mis)interpretations can often

take bizarre and ridiculous form, in turn making the original speaker look, quite unjustly, bizarre and ridiculous. The wise interpreter, said Plato, must have the ability to return written words back to the spirit of their original occasion through understanding their context and what he called their soul in the original speaker. This ability inevitably involves a kind of dialogue between the present and the past, but it also implies there is a certain indeterminateness of meaning in all language. Not only does written language inevitably contain a supplement of meaning lying beyond the restrictions of the text, but also a speaker is incapable of expressing the fullness of what can be thought. According to the Greek understanding of language, behind, beneath, and over any graphic or phonetic expression is that which wishes to be thought, an excess of meaning inhabiting every written or spoken word that it is the interpreter's job to better, though never fully, understand.

Aristotle (384–322 BCE) was also interested in hermeneutics, but it is worth noting that the biggest difference between Aristotle and Plato had to do with the capacity or incapacity of language to contain the fullness of meaning, and the nonresolution between their two views continues to haunt the Western tradition even to the present day. This conflict is evident in arguments between science and religion, for example, or in conflicts between standard views of language and vernacular or creolized usages and the question of which should have relative authority in the public realm. Aristotle always seems to have assumed that nothing is ever lost in the transmission from soul to speech to writing—that writing simply marks the intentions of a speaker and makes them available for everyone. Such an assumption undergirds the propositional logics of science and analytical philosophy that rely on predicative statements such as “S is P,” or “this” means “that,” as if all identities and distinctions were clear and self-evident. It can readily be seen how such assumptions feed into logics of power and control. If meaning can be fixed through the signs of language, then all knowledge itself becomes fixable (made static) once and for all. Curriculum becomes simply a kind of fixed cultural deposit, and teaching is nothing but an act of transmission. For Plato, such assumptions are unsustainable.

### Hermeneutics in the Early Modern Period

The first historian of hermeneutics, Wilhelm Dilthey (1833–1911), argued that the formalization of hermeneutics as a discipline did not begin until the 16th century with the Protestant Reformation. The rallying call of reformer Martin Luther was that the interpretive authority of the Christian church, and of Christian faith itself, lies in scripture alone, *sola scriptura*, rather than in Roman Catholic tradition and its Episcopal offices. This call brought forth the following question: What then is the nature of authority in interpretation itself? A series of treatises appeared attempting to answer the question, the first being Matthias Flacius Illyricus's *Clavis Scripturae Sacrae* in 1567. The primary requisite to authoritative interpretation, said Flacius, is grammatical, linguistic knowledge. This focus on the importance of understanding language—how it functions, its lexical and grammatical origins and operations, and so on—has remained a primary requirement of hermeneutic inquiry right to the present day and has been emphasized by all philosophers of hermeneutics since Flacius. A good etymological dictionary, for example, is an essential tool for all hermeneutic work.

The Protestant Reformation marked the beginning of the end of the unitary worldview of a Christendom controlled by the Catholic Church. Fragmentation became the new reality, evident not just in religion, but also politics and philosophy. By the 18th century, the philosopher Immanuel Kant (1724–1804) in *Critique of Pure Reason* declared the end of metaphysics, or the possibility of philosophically constructing an explanation of how the world actually is. We cannot gain access to the world in itself, said Kant, because the things we know are already interpreted and schematized by our prior experience of them. An objective apprehension of the world is impossible. All we can do, therefore, is examine the manner of our reasoning itself, how in fact we produce the world through our interpretations of it. Since Kant, Western philosophy has been doomed to interpretation, as some scholars have put it. Kant's contemporary, Friedrich Jacobi (1743–1819), coined the term *nihilism* to describe the condition of human life being nothing but an endless round of interpretation, nothing but hermeneutics, with no anchor in objective truth of any kind. Instead of

nihilism, Jacobi proposed *fideism*—all our actions presuppose a sustaining power in the universe that must be trusted implicitly for life to go on at all.

The death of metaphysics—that is, of certainty concerning any claims we might make about the world, produced a crisis in the Western tradition that has not been put to rest to this day. Like the good Lutheran he was, the progenitor of modern hermeneutics Friedrich Schleiermacher (1768–1843) took Jacobi's fideism (we live by faith not by reason) and imbued it with feeling or sentiment. Understanding one another, and the world, is largely a matter of empathy, rather than reason.

Actually, Schleiermacher distinguished between two forms of interpretation, or understanding—loose and strict. Loose or relaxed understanding is what happens all the time. Whether we are reading a book, talking with friends or students, or watching a movie, most of the time we feel we understand what is going on. Based on a kind of mutual feeling, interpretation in this sense is a natural process that can simply be taken for granted. The real issue arises when we are confronted with something we do not understand, as, say, in the case of engaging a work of genius that cannot be understood through any interpretive frames currently available. Or perhaps we experience trauma, such as a soldier who has studied war, but on the battlefield finds him- or herself faced with realities that are literally unspeakable—that is, no words in the available lexicon are adequate to describe them. Hence, it is precisely misunderstanding and incomprehension that make interpretation necessary. This necessity identifies Schleiermacher's sense of strict hermeneutics, the need for a way of creatively engaging that which one does not understand. Premised on the universality of misunderstanding, Schleiermacher's hermeneutics proposed a necessary dialectic or dialogical relationship between what one understands and what one does not. In a way, this relationship echoes Plato; it also foreshadows the later 20th-century hermeneutics of Gadamer.

Schleiermacher was preoccupied with developing a method for interpretation (*kunstlehre*), a project that he eventually abandoned. But one contribution from that effort was the insistence that interpretation is a creative act—that is, understanding the truth of a strange or difficult situation requires an act of imagination to see possible

meanings, rather than just expecting meaning to reveal itself, by itself, and then simply reported by a researcher. Again, echoing Kant, the truth of something cannot be known fully in itself; it requires a creative leap of understanding that can then be folded back dialogically into the formation of new comprehension.

### Hermeneutics in the Contemporary Era

The desire for a specific method for hermeneutics was taken up later by Dilthey, who was the first to make a distinction between the natural sciences and what he called the human sciences. Nature we explain, said Dilthey, but humans we must understand (*verstehen*). Under the influence of the new phenomenological investigations of Edmund Husserl (1859–1938), Dilthey described understanding as a category of life that is at work when we are able to show how texts, artifacts, works of art, and so on are expressions of lived experience. To understand a novel, to interpret it correctly, requires showing how it reveals experience as lived. Good interpretation shows the connection between experience and expression.

Martin Heidegger (1889–1976) is arguably the most important (Western) philosopher of the 20th century. In the tradition of arguing against metaphysics, Heidegger proposed that all attempts to secure the meaning of life through method were not just impossible, but positively delusional. They represented the human refusal to accept the infinite and limitless character of being (*dasein*). Indeed, metaphysics and its handmaid, method, are nothing but a fearful flight from mortality. Because we are afraid of the infinity of being, we try to secure ourselves through interpretations we hope can be drawn ever tighter. The worst form of this is traceable right back to Aristotle's propositional logic  $S$  is  $P$ ; this subject has this predicate. If  $A$  happens,  $B$  will always follow. It is a linear theory of causality that Heidegger explicitly rejected because there is always more to be said about a situation than can be contained in any proposition. Take for example the simple proposition, something a student might say regarding a curricular work: "This text is difficult." Standing alone, the meaning seems obvious. Hermeneutically, however, a whole range of possible meanings is present. Who is the speaker, a Grade 4 pupil or a

postdoctoral fellow? Maybe the proposition comes from a postdoctoral fellow doing research on a child's writing. Or maybe the speaker is an international student struggling with a class reading in English, not his or her mother tongue, an interpretation that opens up the whole issue of internationalization in education today. What makes the text difficult? Is it because of content, format, or font? Does the difficulty arise because of a pedagogical failure on the instructor's part, not having made clear what a reader might expect from the text or how it fits into the broader themes of the course of which it is a part? The point is, the simple proposition cannot be held to a single meaning, but is always, already loaded with possible meanings, each of which also spins off into other ranges of possible meanings. This uncertainty is not a problem, as might be made under a charge of relativism; it simply describes the irreducible quality of human life and experience, its reflection of the infinity of being. For Heidegger, hermeneutics involves hearing the *Logos*, or word that has been lost or suppressed by metaphysical philosophy.

It has been noted by many that virtually all of Western philosophy since Kant has been obsessed with the determination to overcome metaphysics, not just the figures mentioned here so far, but also Sigmund Freud, Karl Marx, Jürgen Habermas, Ludwig Wittgenstein, Michel Foucault, and Jacques Derrida. The one major philosopher who has refused this determination is Gadamer, a student of Heidegger. Gadamer argued that because metaphysics itself operates as a language, it too can be hermeneutically interpreted, but never overcome. What is important is to understand how metaphysics is locatable as a tradition in the West that attempts to solve particular kinds of problems. This inspired Gadamer to formulate his famous "logic of question and answer" noted earlier.

Gadamer's suggestion that all knowledge arises in the context of tradition may be his most important contribution to hermeneutics, and it has two major implications. The first is that all understanding takes place within a horizon of past, present, and future. Whatever meets me as new arrives on my consciousness that has already been formed by my past. My mind and being are never *tabulae rasae*, but instead are the very means by which anything new can be registered as such at all. In a way, I always, already am a tradition, and this is not

something to be overthrown because my tradition (my prejudice, Gadamer called it) provides the means by which any new thing, event, circumstance can even be seen as such. Whether my comprehension of what is new is accurate, however, is not something I can judge for myself. It requires a conversation with the (new) stranger in front of me so that together we might come to a common understanding of each other. It is interesting to note that one of Gadamer's doctoral students, Helmut Kohl, became Chancellor of Germany in 1982. In his work to bring an end to the cold war, to organize the reunification of East and West Germany, and draw plans for the new European Union, one can see the Gadamerian principles of hermeneutic dialogue at work and the envisioning of a new politic based on mutual recognition and understanding.

A second implication of Gadamer's hermeneutics is that it is impossible to live outside tradition. There is no pure place in which to start a totally new life because one always carries what went before into the present, which works into the future. The challenge lies in dealing with one's old life in a new way. This view set Gadamer at odds with neo-Marxist philosophers such as Habermas (1929– ) and any who would posit a radically revolutionary view of social reform, a vision of a future disconnected from the past. It is also the point on which interesting debates are currently going on between hermeneutics and the deconstructionism of Derrida (1930–2007) articulated by John Caputo (1940– ) under the name radical hermeneutics. How does the ambiguity of life relate to the weight of tradition? That question is too large to be entertained in this entry.

It may be noted that in the academy, hermeneutics has been of particular interest to international graduate students who have come from places of strong tradition. In hermeneutics, they find a way for discerning openings in their own traditions that in turn enables creative dialogue with other traditions. In this sense, hermeneutics holds promise for a new conversation among the world's people regarding our shared future. Curricularly, there can never just be my tradition, only my-tradition-in-relation-to-others. In underscoring curriculum as a relational phenomenon, hermeneutics implicitly places ethical concern at its center.

## HERRICK, VIRGIL

---

Virgil Herrick's (1906–1963) importance to the history of curriculum studies rests largely upon his role as a transitional figure in the field's mid-20th century reconceptualization from one in which scholars' main responsibility was curriculum development to one in which scholars strove to understand curriculum through multiple strands of curriculum theorizing. The most visible demonstrations of his role as a key figure in this transformation of the field are his sponsorship, with Ralph Tyler, of the 1947 University of Chicago Curriculum Theory Conference and his mentorship of James Macdonald and Dwayne Huebner, two major scholars who, among others, are credited with inspiring the reconceptualization.

Some curriculum historians proclaim the 1947 conference as the very birthplace of curriculum theorizing. Others disagree, based in part on Herrick and Tyler's own statement in the conference proceedings that little progress in curriculum

theorizing had been made in the 20 years prior to the Chicago gathering. Most scholars, however, recognize the conference as a benchmark at the very least because it was the first effort to consider curriculum theory as theory. Having convened the conference for the purpose of identifying the major problems of curriculum theory, Herrick and Tyler confessed in the published proceedings to a sense of disappointment at the lack of recent progress in that area. However, pointing to the lack as a great opportunity for fruitful contribution to the field, they went on to identify several problems that did, indeed, eventually generate prolific scholarship and in some instances, curriculum controversies. The problem areas they highlighted in the proceedings, *Toward Improved Curriculum Theory*, included needs for (a) helping teachers make decisions in regard to balancing the well-being of individual children, the demands of society, and the academic demands of subject matter; (b) honestly recognizing and critiquing the role of values in curriculum work; (c) collaborating at all levels in the identification of critical issues and their underlying generalizations, as well as identification of what those levels are; and (d) addressing problems on a broad front through multidisciplinary teams that included a curriculumist to synthesize and communicate the related research studies.

Although both Herrick's and Tyler's scholarship naturally manifests traits of an era that venerated science and progress, their separate bodies of work reflect dissimilar emphases that explain the different legacies each left in the field. For example, Tyler's contribution to the 1947 conference—"The Organization of Learning Experiences"—explicated one of the four steps of his well-known rationale. Although Tyler does not appear to have intended for the rationale to have been used in a technocratic fashion, its value-neutral veneer and its emphasis on objectives and evaluation made it highly compatible with the emerging demands for a more scientific and increasingly subject-centered curriculum. The works of major scholars who began their career under his direction, such as Louis Raths, John Goodlad, Benjamin Bloom, and Lee Cronbach, manifest Tyler's affinity for clear purposes that serve as a basis for evaluation.

Herrick's contribution to the 1947 conference—"The Concept of Curriculum Design"—also incorporated discussion of objectives, organization,

subject matter, and evaluation. However, he strongly emphasized the need for analysis of curriculum designs and decisions through examination of their underlying value assumptions. Beginning their professional careers as students with Herrick at the University of Wisconsin, Macdonald and Huebner went on to develop this concern for value assumptions into some of the earliest efforts to understand curriculum as political text. In addition, one of Herrick's major interests—the analysis of classroom episodes as a method for testing the generative potential for various theoretical frameworks—can be seen as a prelude to Macdonald and Huebner's own work in creating new categories for curriculum thought.

In 1965, 2 years after his mentor's death, Macdonald coedited a collection of Herrick's essays as evidence of the newly emerging field of curriculum theory as an area of inquiry. Illustrating Herrick's contributions to alternative curriculum conceptualizations, the essays included a critique of the growing hegemony of subject matter as the primary referent for curriculum design and development. In one of these, "Organizing Centers," Herrick's sophisticated discussion of the central concept explored a variety of organizational schemes that might provide enhanced meaningfulness, continuity across the curriculum, and provision for individual differences. In another, "Directives for Curriculum Planning," he cautioned that there is more than one base upon which curriculum structures can be built and argued that a preoccupation with subject matter could become a barrier to imagining future possibilities. Furthermore, based on his conviction that analysis of teaching operations was central to building sound theory and practice, he correctly predicted the early demise of any reform effort that disregarded the particular teaching situation, as did the post-*Sputnik* structure-of-the-disciplines movement.

A prolific scholar on a wide range of topics related to both curriculum theory and practice, Herrick received his PhD in 1936 from the University of Wisconsin and served on the faculties of Syracuse University (1938–1940), the University of Chicago (1940–1948), and the University of Wisconsin (1948–1963). In addition to speaking and consulting nationally, he served as president of

the American Educational Research Association from 1957 to 1958.

## HETEROGENEOUS-HOMOGENEOUS GROUPING

---

Ability grouping, and its close relative, tracking, has been of concern in education for many years and the subject of more research studies than almost any other educational practice. *Heterogeneous grouping* refers to grouping arrangements in which whole classes of students are grouped so that they vary according to achievement or inferred ability or to within-class groupings that place students in similarly diverse groups to learn together. This grouping practice is associated with efforts to ensure high academic standards for all students and to allow all students the benefits of access to high-level instructional practices. Homogeneous grouping involves creating groups in which all members are considered to be the same in some way or at the same learning or achievement level. Grouping practices have effects on achievement, self-esteem, understanding of diversity, and other cognitive and social outcomes.

Those who promote homogeneous grouping for instruction (including many teachers and parents)

argue that it is easier to target instruction when students are grouped by ability. Gifted education and special education are both examples of attempts to group students homogeneously in ways that have major implications for the instruction to which they are exposed and the expectations of those who teach them.

Heterogeneous groups are sometimes discussed only in terms of differences in learning levels or performance, but groups can be heterogeneous in many ways, including differences in race, gender, language, religion, social skills, sexual orientation, and so on. The arguments in favor of heterogeneous grouping include the following:

1. The world is increasingly diverse (heterogeneous), and it is only through working with others who are different or who are perceived as different that students will learn to work cooperatively and without prejudice with a wide range of other people.
2. Heterogeneous groups lend themselves to natural peer support and peer tutoring, thereby increasing the number of teachers in the classroom and significantly altering peer relationships.
3. Heterogeneous grouping can significantly minimize the stigma associated with being in the "low" group, including the risks of self-fulfilling prophecy and subsequent diminution of learning opportunities.
4. The intended gains for students in ability groups often fail to materialize, and formation of such groups often correlates with income, social class, and race, resulting in racially and class-segregated classes and instructional groups.

Heterogeneous grouping is closely related to concepts of detracking and has been used to minimize race-based segregation as well as to address the inclusion of students with disabilities in more typical school settings.

The use of heterogeneous groups is one of the key concepts within the field of cooperative learning in which a small heterogeneous group of students works toward a shared goal with task interdependence and individual accountability. Elizabeth Cohen's work on cooperative group work, however, made it clear that unless status issues are addressed specifically and directly, even

students who are in heterogeneous groups will quickly replicate societal patterns of domination and participation, privileging those from dominant gender and racial groups.

Reviews of research on ability grouping have yielded few results favorable to the practice. The effects of tracking are particularly negative for poor, minority, and limited English proficient students. Some research in this area has found that high achievers may gain from ability grouping at the expense of low achievers, but most studies indicate that, overall, the effects of ability grouping are negligible for students at all achievement levels. In 1989, the Carnegie Council on Adolescent Development recommended the elimination of all tracking (ability grouping) in schools serving early adolescents.

Many teachers continue to support ability grouping because of their concerns about management and a lack of preparation for teaching students with diverse learning needs, but many schools have begun to implement detracking measures. Implementation of strategies based on multiple intelligences (Howard Gardner's work, specifically) and differentiated instruction have made reliance on large group, one-size-fits-all instruction outdated, thus decreasing some of the arguments offered in support of homogeneous grouping. Instructional strategies that offer variations in how materials are presented, allow students to engage in different ways with learning activities, and use alternative forms of assessment make it increasingly possible for teachers to teach more heterogeneous groups in ways that are educationally sound and that minimize stigma and marginalization.

## HIDDEN CURRICULUM

---

The term *hidden curriculum* has been used in two quite different ways in curriculum studies. The more common and influential usage refers to student learning that is not described by curriculum planners or teachers as an explicit aim of instruction even though it results from deliberate practices and organizational structures. As coined in 1968 by Philip W. Jackson in *Life in Classrooms*, the term was intended to bring attention to elementary-school learning that results from students' experience of the conditions of classroom life. Jackson argued that a good part of student success depends on learning how to live in a crowd of other students, how to gain praise from the teacher, and how to respond to the authority of the teacher and the institution. This curriculum is hidden in the sense that it is not included in institutional statements of expected learning outcomes and may not even be perceived by the teacher as an intended outcome of instruction. For Jackson, the existence of the hidden curriculum provided insight into some of the causes of student success and failure in school. Inability to master the hidden curriculum would hinder a student more and lead to more serious consequences than inability to master the explicit, discipline-based curriculum. Although this usage of hidden curriculum first appeared in Jackson's work, the notion of incidental learning or undirected experiences had been discussed by John Dewey and Franklin Bobbitt (and others) decades earlier.

A second usage of hidden curriculum appeared in 1970 in Benson R. Snyder's *Hidden Curriculum*. Where Jackson had been concerned with student learning that teachers do not intend and may not even be aware of, Snyder was concerned with knowledge students ought to acquire, but do not, because it is not part of the official curriculum. This second usage of hidden curriculum continues to be discussed (e.g., in literature concerning the education of autistic children), and it is sometimes conflated with the first usage.

By the 1980s, as reconceptualism and critical theory contributed new perspectives on curriculum studies, the concept of the hidden curriculum became an explanatory mechanism for the reproduction of social inequality. In Jackson's portrayal

of school life, student responses to the hidden curriculum (adaptation to or rejection of the culture of school) were largely unintended by teachers and administrators, but the hidden curriculum soon came to be seen as a hidden agenda, a set of deliberate practices with intentional, and largely detrimental, outcomes. Scholars such as Jean Anyon, Michael Apple, and Henry Giroux saw the hidden curriculum as a tool deliberately used by dominant groups to maintain their social privilege. The supposed legitimacy of inequities based upon race and class could be implicitly taught to students through their experience of social life in the school and classroom, while official curriculum lessons about democracy and equality would be qualified or undercut by the structure and practices of schools.

Questions about whether (or how) students could resist the messages of the hidden curriculum were taken up by Apple and by Paul Willis, while Elizabeth Vallance argued that what was being called the hidden curriculum in the 1970s (the need to adopt personal traits consistent with the conditions of crowds, praise, and power) had been the official curriculum of 19th-century U.S. schools, which had explicitly sought to socialize students into the emerging industrial society. Society's acceptance of this dimension of "Americanization" made it unnecessary for the curriculum to be explicit in the 20th century.

Others, such as Catherine Cornbleth, asked whether there really is a hidden curriculum or what the term entails and argued that it is not clear what, if anything, students learn from the hidden curriculum. Despite these questions, the concept continues to be used to examine such disparate subjects as high-stakes testing, gender, children's literature, moral education, community service, and ethnic identity construction.

In 1992, commenting on debates about the nature and significance of the hidden curriculum, Jackson noted that the popularity of the concept, with its implication that schools could be seen as systematically affecting students in undesirable ways, demonstrated a major shift in 20th-century attitudes toward school curriculum.

## HIGH-STAKES TESTING

---

Often criticized in curriculum studies as fostering a myopic view of curriculum, high-stakes testing has become a pejorative term referring to the gambling nature inherent in test assessment methods of many standards-based learning programs. A number of these testing protocols use a single, annual, standardized test to determine a student's academic progress. Test results are often used to identify a learner's progress and to determine promotion to the next grade or retention at the current grade level. Tests administered in large urban areas take weeks to grade and disseminate back to schools. The delays force students to either attend summer school or to repeat the grade in the following year.

Standardized tests have grown to become the preferred assessment method for public school districts, and consequently, their presence impacts the curriculum choices for schools. Testing is used to satisfy the assessment requirements of the No Child Left Behind Act of 2001 (NCLB). The NCLB act reauthorizes the Elementary and Secondary Education Act to distribute federal funds to the nation's public school districts. NCLB also includes accountability provisions with consequences impacting entire school districts. Failure to meet benchmark goals can lead to reduced funding, reconstituted schools, relocated students, and fired teachers and administrative staff.

In some cases, tests measure students' progress only in the core subjects of mathematics and language arts, ignoring development in other learning areas. This limitedness may have the unintended

consequence of restructuring a school's priorities in curriculum planning. Some schools bypass non-test subjects such as art, music, physical education, and social sciences to spend funds and time on tested subjects. Still others claim the current use of tests has strayed from the original intent of measurement.

### The Measurement Movement

Testing advanced in U.S. education at the beginning of the 21st century as educators strove for more rational structure in learning while meeting the need to assess progressive pedagogy. Influenced by the work of European psychologists Wilhelm Wundt, Frances Galton, Alfred Binet, and Theodore Simon, Americans began to institute scientific methods in learning and to experiment with intelligence tests. As the popularity of testing grew through the measurement efforts of E. L. Thorndike and the social efficiency curriculum of J. Franklin Bobbitt, education moved closer to instituting standardized curriculum and assessment policies through the 1930s and 1940s.

In time, growing criticism of a lack of structure in education goals led to calls for reform. The cold war of the 1950s and 1960s brought increasing funds and influence to the scientific community to improve education. Their influence led curriculum developers to include more structured development and assessment methods in their planning. The last half of the 20th century has seen the further inculcation of test-driven curricula in the nation's public schools even as questions arise concerning the efficacy, validity, and fairness of standardized testing.

### The Arguments For and Against Testing

Proponents argue that testing is beneficial in identifying low-performing schools and targeting students in need of additional help. Others add that testing offers educators the ability to isolate problems in comprehension and in processing information. Some studies suggest that test-based accountability has a positive effect on student learning. Some critics question the fairness of tests when the factors key to success on high-stakes tests (better funding, smaller classes, less teacher turnover, more public PreK) are missing from neighborhoods of

low-income, urban schools. Other critics argue that a test-centered curriculum, rather than measuring knowledge, assesses only what test makers decide is important. A high-stakes, one-shot, annual snapshot of a student's progress cannot effectively measure overall performance as well as a series of smaller, content-based tests.

Some educators argue that test-based assessments are less informative than portfolios, artifactual evidence, interviews, and other student-based assessments. Some observers of testing state that tests ignore minority perspectives while creating and defining the standards that are the basis for the interpretations and truths taught as official knowledge, marginalizing those minorities.

Understanding the need for assessment in a progressive education process, many have called for standards to guide policy makers in crafting effective and fair standards to oversee testing conditions. *The Standards for Educational and Psychological Testing* were developed through the joint efforts of the National Council on Measurement in Education, the American Psychological Association, and the American Educational Research Association to outline principles for testing that are fair to students, minimally invasive of the teaching environment, and meaningful in the assessment of student progress and learner needs. The features embodied in the standards are as follows:

- Decisions affecting learning paths of students, such as retention, tracking, or graduation, should not be based on a single test, but should include all relevant, valid information.
- Test results deciding promotion or graduation should address only the skills that students have had an opportunity to learn. Tests determining grade promotion or high school graduation should offer multiple opportunities to pass, if needed.
- Clear descriptions of the intended uses of test results should be made known.
- Testers are responsible for negative consequences for racial and ethnic minorities.
- Special accommodations for students with disabilities and students with limited English must be made.

High-stakes testing continues to generate debate in colleges, universities, and among education

policy makers and practitioners. Test makers are working to improve on the validity and timeliness of their product, but questions remain on the impact of testing on education and the efficacy of test assessments. Time and further study will reveal the impact and consequences of testing programs on educational progress and cognitive development.

## HISTORICAL RESEARCH

---

Historical research has enriched the study of many areas in the field of education, including curriculum studies. At least since late in the 19th century, historical work has illuminated the study of the curriculum in elementary and secondary schools and to a lesser extent in higher education. Early pioneers in the field, such as Robert Quick, looked back to the Renaissance as the age that rediscovered the classics and, thereby, defined the parameters of the school curriculum and the issues that would be engaged in attempts to change it. Quick’s work details the educational thinkers who critiqued, and defended, the classics from the time of the Renaissance to the late 19th century when he was writing. His represented an intellectual history approach to the study of the curriculum—that is, he studied the ideas of those who wrote about studies in schools.

Much of the development of the curriculum in the 20th-century United States has been in a direction away from studies of the classics, thereby highlighting one of the profound issues in the history of the U.S. school curriculum, the relationship of classical studies in secondary schools, or basic intellectual studies in elementary schools, to alternative approaches known variously as child-centered or some other non or anticlassical approach, which can collectively be referred to as progressive education. It is the tension between the classics and various alternatives to the classics that has been the subject, directly or indirectly, of much historical research in curriculum studies and that will be the major focus of the rest of this entry.

### Secondary School Curriculum

Historians have made the secondary school curriculum a subject of study much more often than the elementary school curriculum, and thus most of this entry is devoted to secondary education. The U.S. high school emerged as a near mass institution in the early 20th century. The shape of the curriculum in the high school has been the subject of vigorous debate, at least since the 1890s. In that decade, the Committee of Ten of the National Education Association prescribed four versions of academic studies that it saw as appropriate for high school students. The versions differed in the amount of classical language study prescribed, ranging from near majority in one to almost missing in another, with middling amounts in the other two. The importance of the Committee of Ten was not specifically in its stance on classical studies, however. Rather, it committed the high school curriculum to various versions of academic study, with greater or lesser emphasis on history, the sciences, and other subjects in addition to the classics in its four alternatives.

Two decades after the Committee of Ten, enrollment in the high school had grown significantly, including segments of the population in its student body that heretofore had not stayed in school past the elementary years. To reach these students, curriculum makers and school administrators developed a social efficiency approach to the high school that stressed vocational subjects, testing, and ability grouping of students to decide who would take what subject, as well as extra academic experiences

to extend the impact of the institution. The ideas of the social efficiency educators were profiled in the first of two volumes on the history of the U.S. high school written by Edward A. Krug. He showed how social efficiency led to an approach to the high school curriculum that privileged vocational studies and other useful studies such as home economics and business education. Krug also showed how addressing extra academic concerns such as student play, vocational readiness, and adjustment to a new industrial society were major concerns of the social efficiency educators. The single document of the social efficiency movement was the *Cardinal Principles of Secondary Education*, produced by a leading committee of educators and published by the National Education Association near the end of World War I.

Krug continued his intensive study of the high school and its curriculum in a second volume on the high school in the 1920s and 1930s. In this volume, he showed an evolution of social efficiency into a variety of other approaches to secondary schooling, all of which were animated by a conviction that solely academic work was not sufficient to reach all the students who were enrolling in the high school. He also paid careful attention to the ideas of champions of more traditional approaches to the high school, as they confronted the critiques of their colleagues devoted to curricular change. Vocational education became especially important as an alternative to academic studies in the post-World War I period, buoyed by federal legislation authored by Southerners such as Senator Hoke Smith of Georgia that supported vocational studies in the schools. The identification of the sponsors of vocational education legislation with employers, in the South and elsewhere, threatened to taint vocational education as the tool of employers to produce a workforce rather than as a vehicle by which working-class students, and others new to the high school, might use it for social mobility or acknowledgment of the honor of the work done by their parents and to which they might look forward.

Curriculum historian Herbert Kliebard has dealt sensitively with the contours of vocational education in an attempt to locate its proper place in the educational landscape of the 20th century. His nuanced analysis contradicts simplistic analyses of vocational education that demonize it as a

tool of capitalist manipulation or an agency of working-class liberation. The relationship between vocational and liberal studies was productively discussed in a number of his works by the eminent educational philosopher, John Dewey. Arthur Wirth produced a sensitive historical study of Dewey's debates with vocational and social efficiency educators that effectively places the debates in a context within which the actions of all actors was evaluated. Wirth's affinity for Dewey comes through in this analysis, as it does in Kliebard's works, but in these cases, Dewey is appreciated but not deified, analyzed but not sanctified.
